**The United States.**—Practical trade-school work in the U. S. began with the foundation of the New York trade schools in 1881. At first the work of these schools was confined entirely to evening classes. From the beginning the aim has been to train beginners for practical work at the trades. It is not designed, however, to reach the expertness of the finished mechanic, but rather to give a thorough grounding in the science and practice of the trade, leaving speed and experience to be acquired in after-practice at the trade. These schools have been pre-eminently successful. Starting with thirty-three pupils in 1881, the attendance has steadily grown, until in 1893 it reached 556. Manual instruction is supplemented in all classes by instruction upon the nature of materials and the scientific principles involved in the trade. Schools of like nature have been established by the Philadelphia Master Builders' Exchange and by the Pratt Institute of Brooklyn. In all of these institutions the principle obtains of confining the instruction given in the

schools to an essentially practical preparation for the trade and to pupils of sufficient age to learn rapidly, leaving the general education to be gained in the common schools previous to entering.

This system has received the endorsement of the National Association of Master Builders, who at their meeting of 1888 at Cincinnati passed resolutions recommending that a man who wished to enter the building trades should go at first to a trade school to learn the science and practice of his trade. When the trade-school course is finished and he has proved by an examination held by a committee of master mechanics that he has profited by it, he is to enter a workshop as a "junior." When old enough and able to do a full day's work he is to apply for a second examination, which if passed entitles him to be considered a journeyman.

This system seems well suited in its essentials to the needs and genius of the people of the U. S. and destined to develop throughout the country. One great obstacle to progress, however, is the attitude of the labor-unions, who oppose the entrance of trade-school graduates into the trade upon the same ground that they seek to limit the number of apprentices. In order to secure a full and free development of the trade-school movement in the U. S., a recognition of the trade-school graduate by the organization of the journeymen as well as by organizations of masters is necessary, and his establishment with a definite place and a definite economic value in the industrial world. C. R. RICHARDS.

**Schooner:** a vessel with two or more masts and fore-and-aft rigged; or, if the foremast have a square topsail, the vessel is called a topsail schooner. When sailing by the wind, schooners have an advantage over square-rigged vessels, and they are easily handled by a small crew.

**Schoonmaker, AUGUSTUS:** lawyer; b. at Rochester, Ulster co., N. Y., Mar. 2, 1828; was educated in the public schools of his native town; 1848-50 taught in the district schools of the county; in 1851 began the study of law, and was admitted to practice in 1853. He was elected county judge in 1863; re-elected in 1867; in 1875 was elected to the State Senate, where he drafted a bill to provide for uniformity of text-books in the common schools, which embodied the principle of the one which finally became a law of the State. In 1877 he was elected attorney-general of the State, and during his term of office (1877-79) had to deal with the questions relating to the release of William M. Tweed, the complications of the Erie Railway, the new apportionment under the census of 1875, and the constitutionality of that portion of the New York city charter creating a board of estimate and apportionment. In 1883 he was appointed one of the civil-service commissioners of New York. In 1887 he became an interstate commerce commissioner. D. at Kingston, N. Y., Apr. 10, 1894.

**Schopenhauer, shō'pen-how-er, ARTHUR:** philosopher; b. in Dantzic, Prussia, Feb. 22, 1788. His father was a banker; his mother, Johanna, a writer of novels and books of travels. He entered the University of Göttingen in 1806, studied philosophy under Schulze the skeptic, and gave especial attention to Kant and Plato; in 1811 heard the lectures of Fichte at Berlin; wrote his famous essay, *On the Fourfold Root of the Principle of Sufficient Reason*, for his degree at Jena in 1813; adopted Goethe's theory of colors, and wrote in 1816 an essay *On Seeing and Color*. His principal work, *The World as Will and Representation*, was composed in Dresden and published in 1819. After a visit to Italy he settled at Berlin University as docent, and remained there in this capacity until 1831, with the exception of some intervals spent in Italy. Want of success as a lecturer caused his withdrawal from Berlin in 1831 to Frankfort-on-the-Main, where he spent the rest of his life in seclusion, and died Sept. 21, 1860. His characteristic doctrine is pessimism. The world is the worst of possible worlds. We can alleviate our lot in it by sympathizing with the suffering, and in a still more effectual way by an asceticism which destroys our will to live. This view of the world he connects with his doctrine of the Will, but not in a very obvious manner. According to him the Will is the only substantial essence in the universe; it is Kant's "thing in itself." The intellect, consciousness, our entire theoretical activity, is simply a result of the Will in its higher forms. The Will constantly energizes toward life, and the stadia of nature are simply the instrumentalities of the Will created on its way to life. Mere matter, as the product of forces, is the lowest

Schubert, James, A. H., M. D., lawyer and historian; *Academy of M. S.*, Mar. 20, 1899; graduated at Harvard; served in the civil war; practiced law in Boston; was captain in U. S.; author of *Island Textlands on the Atlantic Coast*; *Personal Property, Real Estate, Wills, and the American Constitution*. He is more widely known as author of *History of the United States under the Constitution*, 1890-1910. C. H. T.

Belmont, at New York, WILLIAM COCHRAN, a navigator; he, at  
New York, about 1817. He was being employed by the  
United States Government, but resigned in 1819 and one  
of his last assignments being to find a new route  
from New York to India. Leaving the United States June 11,  
1819, he passed by the Strait of Magellan, discovered the passage  
between the Horn of Fuca and Horn of the Strait, was the first to discover  
the passage, and saved the Indian in safety. Then he was  
rewarded for his extraordinary services, presented the  
United States Government, and died on the coast of  
California in 1820. This was the route was specially  
discovered by the Strait of Magellan; at South  
America, at New York.

• **Novelty** – new thing of the nature of value

[illegible]

Schradner, Julius Eugenovich painter, b. in Berlin, Prussia, June 10, 1815; studied painting in the studios of C. M. Kuhnke only, in Dresden, 1837-42, and in Rome 1842-47, and was appointed professor in the Academy of Berlin in 1861. His most celebrated pictures are *The Death of Heinrich von Coudenberg*, the great fresco in the New Museum at Berlin, *The Conversation at the Church of St. Sophia in Constantinople* (copy), *Arthur before Marston*, *Idyll*, and a number of portraits.

**Schrader**, Otto; comparative philologist; b. at Waimar, Germany, Mar. 28, 1860; educated at the gymnasium in Wismar, and at the Universities of Bonn, Leipzig, and Berlin; teacher in the gymnasium here, and assistant professor in the University of Bonn; author of *Linguistische Studien über die Furchungen der Mundschleimhäute und Mundhöhle* (1884); *Speechorganebau und Sprachlehre* (1901), 5d ed., 1905; Eng. trans., *Professor's Lectures on the Human Organs of Speech*; *Feder-Haken im Bild eines Leibes und seiner Werk.* (1907) which illustrates the differences between Haken's *Kulturplanismus* and Humboldt's (1804). He is an eminent authority in linguistic archaeology.      W. L. W.

**Schreyer, Adolf:** animal painter; b. at Frankfurt-on-the-Main, May 9, 1828; studied at the School Institute, Frankfurt, 1846-51; Paris Salons, 1864, 1865, and 1867; member of Brussels Exhibition 1860 and Munich 1876; teacher of Leopold of Belgium. He has sketched and painted in Egypt and Algeria, and lived in Paris until 1870, when he removed to Kronberg, near Frankfurt. His pictures of horses and Arabs are very popular in the U. S., and many of his works are in private collections in New York and other cities. Studios in Paris and at Kronberg. W. A. C.

**Schriver, Elmer A.**, soldier, b. at York, Pa., Sept. 16, 1842; graduated at U. S. Military Academy, and promoted brevet second lieutenant of artillery July 1, 1860, captain 1862; resigned July 31, 1866, having served as assistant staff and assistant adjutant-general almost continuously from 1862 to 1866. In Apr., 1867, he accepted an appointment on the staff of Gov. Morgan of New York, with the rank of colonel and A. D. C., and May 14 was appointed lieutenant-colonel of the Eleventh Infantry U. S. army, colonel and A. D. C., May, 1867, and served as chief of staff to Gen. McDowell and Gen. Fremont (third corps); appointed inspector-general U. S. army (rank of colonel Aug., 1869), and assigned to the Army of the Potomac; was stationed at Charlottesville and Gettysburg 1869, and in the Richmond campaign of 1869, up to the investment of Petersburg. He was breveted brigadier-general in 1864 and major-general in 1865; was inspector of the Military Academy 1866-71; retired 1881.

Revised by James M. Moore.

**Schröder, Heinrich** (Lepowit; actor, 1, at Schwelm, Germany, Nov. 3, 1744); was abandoned while still a boy, by his parents, who were travelling actors at Hammelburg; found his parents in 1759 in Schwelm, where he was trained to become a dancer; joined them finally to Hameln in 1764; undertook in 1771 the management of the troupe after the death of his step-father, A. Krumpholtz, and raised the stage of Hameln to a position of literary and artistic influence in Germany, partly by his plays collected and published in 1841 in four volumes, with an introduction by F. G. G. partly by the rigid course of moral propriety with which he governed the theater, but especially by his great moral-sentimentalizations of some of the principal Shakespearean characters, such as Lear, which he was the first to introduce on the German stage. D. at Rellingen, Sept. 3, 1814. His life has been written by F. J. W. Meyer (1846) and Brander (1844).

Reviewed by D. H. VALENTINE.

**Schröder, Sophie (Bürger):** actress; b. at Paderborn, Westphalia, Feb. 23, 1781; appeared upon the stage when twelve years of age in St. Petersburg, where the troupe to which her parents belonged was playing; married in 1795 Stollmers (whose true name was Smets), the director of another band, in 1804 the singer Schröder, and in 1825 the actor Kunst; acted in all the principal theaters of Germany, but principally at Vienna, and acquired a great fame by her impersonations of Phædra, Medea, Merope, Lady Macbeth, Sappho, etc. In 1840 she retired from the stage with a pension from the Austrian court. D. at Munich, Feb. 25, 1868. Her *Life* was written by P. Schmidt (Vienna, 1870).—Her daughter, **Wilhelmine Schröder-Devrient**, b. at Hamburg, Oct. 6, 1804, made her *début* as a singer in 1821 in *The Magic Flute*; sang as Donna Anna, Euryanthe, Fidelio, etc., and was soon acknowledged as the first singer of Germany; was received with great enthusiasm in Paris, London, and St. Petersburg; retired from the stage in 1847. D. at Coburg, Jan. 26, 1860. She was twice married, the first time (1823) to the actor Karl Devrient. Her *Life* was written by Claire von Glümer (1863) and Wollzogen (1863).

**Schubert, Franz:** "the immortal melodist"; b. in Vienna, Jan. 31, 1797; son of a school-teacher in the Lichtenthal district of the city; was trained chiefly by the organist of the parish church; became leader of the choristers' school of the court chapel; composed his first symphony in 1813; taught in his father's school to avoid conscription; in 1818 became teacher of music in the family of Count Esterházy at Zélez, Hungary; in the same year returned to Vienna, where the publication (1821) of his *Erl King* gained him popularity; gave his first and only public concert in 1828 in Vienna. D. in Vienna, Nov. 19, 1828. He is best known by his songs, several hundred in number, of which some fifty or sixty are celebrated and will live. His music was scarcely known to the outside world during his lifetime. His fecundity was marvelous, and the quantity of MS. left behind to be discovered by the musical world was enormous. His original MSS. prove the great ease and rapidity with which he wrote, rarely making a revision. This, indeed, is the source of a characteristic drawback to the merit of most of Schubert's instrumental compositions—viz., a too great diffuseness, or lack of condensation, coupled frequently with literal repetition of large sections. Among his larger works, aside from the songs, may be specially mentioned the great *C major Symphony* (No. 9), the *Unfinished Symphony*, many fine sonatas for piano solos, and also with violin, trios for piano, violin, and violoncello, the *Mass in E flat*, etc. He wrote several operas which were not successful. Schubert's technical handling of his material compares respectably with his contemporaries, but in this regard he made no attempt at originality. The chief characteristics of Schubert are the continued freshness of his peculiarly delightful melodies, supported by harmonies of equal interest. See the *Lives* by von Hellborn (Vienna, 1865) and Reissmann (Berlin, 1875).

DUDLEY BUCK.

**Schuchardt, shooh'khärt, Hugo:** Romanic philologist; b. at Gotha, Germany, Feb. 4, 1842; educated at the gymnasium in Gotha and at the Universities of Jena and Bonn; 1870-73 privat docent in Leipzig; 1873-76 Professor of Romanic Philology in Halle; since 1876 professor in Graz; author of *Vokalismus des Vulgärlateins* (3 vols., 1866-68); *Ueber einige Fälle bedingten Lautwandels im Churwölischen* (1870); *Ritornell und Terzine* (1874); *Slavo-Deutsches und Slavo-Italienisches* (1884); *Ueber die Lautgesetze* (1885); *Romanisches und Keltisches* (1886); *Kreolische Studien* (1881-91); *Auf Anlass des Volapüks* (1888); *Baskische Studien* (part i., 1893); *Wellsprache und Wellsprachen* (1894). He is a brilliant creative scholar.

B. I. W.

**Schulte, shoöl'te, Johann Friedrich, von:** polemical writer; b. at Winterberg, Westphalia, Apr. 23, 1827; studied law at Berlin; practiced there and at Arnberg and Bonn; became Professor of Canon Law at Prague 1855. He wrote *Handbuch des katholischen Eherechts* (Giessen, 1855); *Das katholische Kirchenrecht* (2 parts: *Quellen des katholischen Kirchenrechts* and *System des allgemeinen katholischen Kirchenrechts*, 1856-60); *Lehrbuch des katholischen Kirchenrechts* (1863; 4th ed. 1886); *Lehrbuch der deutschen Reichs- und Rechtsgeschichte* (2 parts, Stuttgart, 1860-61; 6th ed. 1892); *Die Rechtsfrage des Einflusses der Regierung bei den Bischofswahlen in Preussen* (Giessen, 1869). He made a sensation by his pamphlet *Die Macht der römischen Päpste über Fürsten, Länder, Völker, Individuen* (Prague, 1871), for in it he set himself against the dogma of papal

infallibility. He then (1871) left Prague and removed to Bonn, to whose law faculty he belongs. He is a leader of the Old Catholics. In their behalf he has produced many books and pamphlets, of which may be mentioned a second edition of the pamphlet just mentioned with an addition, *Die entgegengesetzten Lehren der Päpste und Concilien der ersten 8. Jahrhunderte über das Verhältniss der weltlichen Gewalt der Kirche gegenübergestellt*; also *Die Stellung der Concilien Päpste und Bischöfe vom historischen und canonischen Standpunkte und die Päpstliche Constitution vom 18. Juli, 1870* (1878); *Der Cölibatszwang und dessen Aufhebung gewürdigt* (in advocacy of its abolition, Bonn, 1876); *Die Geschichte der Quellen und Literatur des canonischen Rechts von Gratian bis auf die Gegenwart* (3 vols., Stuttgart, 1875-80); *Die Geschichte der Quellen und Literatur des evangelischen Kirchenrechts in Deutschland und Oesterreich und die evangelischen Kirchenrechtsschriftsteller* (1880); *Die Summa der Paucapala über das decretum Gratiani* (Giessen, 1890); *Der Alt-Katholicismus, Geschichte seiner Entwicklung, u. s. w.* (Giessen, 1887); *Die Summa des Stephanus Tornacensis über das Decretum Gratiani* (1891); *Die Summa magistri Rufini zum Decretum Gratiani* (1892).

SAMUEL MACAULEY JACKSON.

**Schultz, John Christian, M. D.:** lieutenant-governor of Manitoba; b. at Amherstburg, Ontario, Jan. 1, 1840; graduated as a physician in 1861; assisted Gov. Mactavish and Bishop Anderson in establishing the Institute of Rupert's Land in 1863. In 1867 and 1868 he agitated in favor of the union of all the provinces; and when the Northwest was purchased by Canada in 1869 he and others, loyal to the Government, were captured by insurgents who opposed the transfer, and were imprisoned in Fort Garry. He effected his escape and in 1870 returned to Manitoba, and at the first general election was chosen to represent Lisgar in the Dominion Parliament, which seat he held until 1882, when he was appointed to the Senate. He was captain of the Lisgar Rifle Company 1871-74; a member of the executive council for the Northwest Territories in 1872; appointed member of the Dominion board of health for Manitoba and the Northwest Territories same year, and one of the board of governors of Manitoba, medical board, and has been president of the Southwestern Railway of Manitoba. He was appointed lieutenant-governor of Manitoba July 1, 1888.

NEIL MACDONALD.

**Schultze, shoöl'te, Carl August Julius Fritz, Ph. D.:** professor of philosophy and pedagogy; b. at Celle, Hanover, May 7, 1846; educated at the gymnasium in Celle, and at the Universities of Jena, Göttingen, and Munich; private tutor 1869-70; high-school teacher 1870-72; privat docent 1872-75; and Professor Extraordinary of Philosophy 1875-76 in Jena University; Professor of Philosophy and Pedagogy since 1876 in the Royal Polytechnic School in Dresden. Of his pedagogical works the best known is *Deutsche Erziehung* (1893), an important contribution to Herbartian literature. Others are *Der Fetischismus, Ein Beitrag zur Anthropologie und Religionsgeschichte* (1871); *Geschichte der Philosophie der Renaissance* (vol. i., 1874); *Philosophie der Naturwissenschaft* (2 vols., 1881-82); *Die Grundgedanken des Materialismus und die Kritik derselben* (1881); *Die Grundgedanken des Spiritismus und die Kritik derselben* (1883); *Die Sprache des Kindes* (1880); *Stammbaum der Philosophie* (1890); *Vergleichende Seelenkunde* (vol. i., 1892); *Der Zeitgeist in Deutschland, seine Wandlung von 19. und seine muthmassliche Gestaltung im 20. Jahrhundert* (1894).

J. E. RUSSELL.

**Schultze Powder:** See EXPLOSIVES.

**Schumacher, shooh'mäkh-er, Heinrich Christian:** astronomer; b. at Bramstedt, Holstein, Germany, Sept. 3, 1780; studied mathematics and astronomy at Kiel, Jena, Copenhagen, and Göttingen, and became Professor of Astronomy at the University of Copenhagen in 1815; removed in 1821 to Altona, where he died Dec. 28, 1850. In 1821 he founded the *Astronomische Nachrichten*. In 1830 he made the observations of the length of the seconds-pendulum, which formed the basis of the Danish scale of measure.

**Schu'mann, Robert:** composer; b. at Zwickau, Saxony, June 8, 1810; after a short course in law and philosophy at Heidelberg, he settled in 1830 at Leipzig, in order to study under Wieck, an eminent piano-teacher; but having crippled his right hand he was forced to devote himself to composition instead of piano-playing, and in his studies was guided by Heinrich Dorn. In 1843 he was appointed Professor of Composition in the conservatory at Leipzig, and

1890 married her at Hirschfeld. While living at Hirschfeld he became convinced almost entirely in the case was criminal and asked to be asylum. Dr. Hirschfeld died July 30, 1904. With this exception of the case, Schumann's work includes almost every act from the commonplace criminal activities to open a crime scene and the open acts of strange and also the crime, such as the case of 1900, a few for the organ, and a number of the criminal acts. The symptoms have been recorded and recorded after the case of Hirschfeld. The case of 1900, a few for the organ, and the crime. Schumann was a highly cultured literary ability, and founded the *Zeitschrift für Psychologie*, a music review to which he contributed many important articles. He may also contribute the founder of the so-called scientific and musical case. There is a certain semi-mythical trait about a number of Schumann's compositions which, however, does not prevent them being clear and strong in the majority of cases. It is a fact in those composed prior to the time when he began to be clouded with coming insanity. The great amount of time and late was time in the case of Schumann. Several books of Schumann have been published, including those by Wagner, 184 of Orsden, 1854, 1855, 1874 and Prof. Nicks, of Edinburgh. *Also see his Collected Writings* as editor of the *New York Tribune* with a number of letters (4 vols., 1854-1855) and *Early* 1875—*Harvard* (1875) and *Early* 1875. The most celebrated works of Schumann are the most celebrated works of her husband's works by her masterly interpretation both in public and private. Besides this, she is known to have first introduced Chopin to the German musical world. (Hans Ritz)

Schubert, Jacob (1841-1928), LL. B.; president of the University of Toronto, Prince Edward Island, and McGill; educated first in Canada, and then from 1860 to 1869 in England, Scotland, France, and Germany. Was Canadian agent for Canada 1875-78; holder of a travelling fellowship (for Great Britain) 1878-80; lecturer of Logic, Psychology, and English Literature in Queen's College 1880-82; Professor of Philosophy in Dalhousie University 1882-90; Professor of Philosophy in Cornell University since 1890, and president since 1892; editor of the *Philosophical Review* since 1892 and of *The School Review* since 1896; author of *Knowledge Ethics and the Ethical Philosophy* (1891), *The Ethical Impact of Jurisprudence* (1894), *Method in the Social and Moral Sciences* and a treatise on the *Logic of the Moral and philosophical sciences*.

Richard D. Webb, Conn. I. A. D. C. (statistman and author; b. 1844; died near Chicago, Illinois, France, Mar. 2, 1922), educated at the University of Cologne and at University of Michigan; was named Prof. Christian Kindel in the publication of a liberal newspaper, began after the revolutionary outbreak of 1849, took part in the revolutionary movement and was sent on the following year, and succeeded in effecting the escape of his companion, Kindel, from imprisonment in the hands of the Prussians. After spending some months in England, he settled in the U. S.; engaged with great success in commercial practices, becoming a leader of the German element of the newly formed Republican party. He began his career of lectur in Milwaukee in 1850; was prominent in the republican national convention at Chicago 1860, and in conducting a successful campaign; was appointed by President Lincoln, minister to Spain, Mar. 1861, but resigned in consequence of the same cost in order to enter the army. He was named as Wright University. He was appointed brigadier-general of volunteers Apr. 1862; became major-general, Mar. 24, 1863, commanded a division in the second battle of Bull Run and in the battle of Chancellorsville; was afterwards in charge of the Eleventh Army-corp at Gettysburg, took part in the battle of Chattanooga, and resigned in 1865. Having settled in Missouri, he was U. S. Senator from that State, 1873-75 and acquired a high reputation as an able speaker on Union, and national policy. He was elected to the astronomical observatory into the Academy of Sciences and he presided over the meetings of the Academy which incorporated Barnard Observatory for the president of the Academy, from a visit to Europe in 1875, until his death at New York. He took part in the presidential campaign of 1876 in Ohio, advocating the election of Hayes, and in the "fourthousand" platform, was one of the candidates of independent candidates of May 16 in New York, and the victory of the Union in 1877-81. From 1881 to

[1962] he was editor-in-chief of the *New York Evening Post*. In the summer of 1964 he supervised the publication of *History and the Making of the World*, and more importantly the Republican supporters of Abraham Lincoln in 1860, itself between and the publication of New York papers have received his hearty support. His *Letter of Henry VIII* (1967) has given him a high place as an historian of 16th and 17th-century England.

**Schus'tar** (Arab. *Tashur*): town, in the province of Kharzash, Persia, on the Karun, in lat. 30° N. N. lon. 48° 05' E. 6000 pop. (1904) Persia and Arabia, ref. 3643. It is fortified, and its streets though narrow and dirty are lined with elegant houses, but large parts are in ruins and undecorated since the plague and the inundation which early in the present century were severely visited the city. It was a flourishing Persian provincial capital, and in ancient times was in a populous district, with Susa, Jarda, Susaberd, to the N. W. and Hara Harkon to the opposite side. Pop., according to Hutton, 27,000. Revised by M. W. HAMMERT.

**Schuyvalov, Peter** *Asiatskii sennitsa*, *Count*, diplomat, b. in St. Petersburg, Russia, July 15, 1827; entered the army, and became a general at the age of thirty. An education general of the Baltic provinces 1864-66 he showed great talent in dealing with the German element in the population and opposed the persecutions of the Protestants. In 1890 he was transferred at the request of the Emperor to the Ministry of Commerce began to show its power. In 1870 became an ambassador to London and arranged the marriage between the daughter of Alexander II. and the Duke of Edinburgh. Again representing his Government at the court of St. James, he did much to avert the threatened war between Russia and Great Britain after the Russo-Turkish war of 1877-78. D. in St. Petersburg, Mar. 29, 1899.

**Schnyler**, city and county; capital of Colfax co., Neb.; on the Platte river, Shell creek, and the Union Pac. and the Burlington Route railways, 16 miles E. of Columbus, 30 miles W. of Fremont (see location, as mapped in Nebraska, vol. 14, 4). It contains 6 churches, high school building, meat packing, a large U. S. sugar-beet experiment station, flour-mill, cigar factory, 2 national banks with combined capital of \$110,000, a State bank with capital of \$25,000, and 4 wood-yards. (Pop. (1880) 1,207; (1890) 2,100; (1895) estimated, 3,100. Etymology of "Sny" is

**Schuyler, Eugene L.L. D.** Diplomates: b. at Haver, N. Y., Feb. 20, 1840; graduated at Yale in 1860 and at Columbia Law School in 1865. He was U. S. consul in Moscow 1867-69 and at Rome 1869-70; secretary of Legation at St. Petersburg 1870-73 and at Constantinople 1875-78; *editor of* *Daybreak* at Philadelphia (1880-82), *editor* to Greece, Serbia, and Roumania 1882-84, *correspondent* at Cairo from 1880 till his death. In 1873 he travelled in Central Asia; an account of the journey is given in his *Turkistan* (2 vols., 1874). Besides contributions to magazines, etc., he wrote also *Peter the Great* (2 vols., 1884) and *American Diplomacy* (1890). D. at Cairo, Egypt, July 18, 1890.

**Schuyler, Peter:** soldier; probably near Newark, N. J., about 1710; recruited and commanded the regiment called the Jersey Blues, and joined the army for the invasion of Canada 1746; commanded Fort Clinton in Saratoga 1748-49; again joined the colonial army with his regiment 1754; attended the congress convoked by Gov. Shirley at New York 1765; was in command at Oswego when that place was taken by the French Aug. 14, 1766, and for a short time was a prisoner in Canada, and was again in command of the New Jersey regiment in Sir Jeffrey Amherst's campaign, which resulted in the conquest of Canada 1759. D. near Newark, N. J., Nov. 17, 1782.

**Schuyler, Philip:** b. at Albany, N. Y., Nov. 30, 1732. He was appointed captain of New York volunteers in June, 1755, and was engaged in the expedition against the French at Crown Point. At the end of the campaign of 1756 he left the army, but in 1758 accepted the appointment of commissary with the rank of major. Two days after the birth of Junior Hill Congress appointed him a major-general, and placed him in command of the northern department. In the expedition against Canada Schuyler commanded that body of Lake Champlain, but was compelled, owing to ill health, to relinquish his command to Montcalm at St. Julien and return to Albany, after having upon possession of Lake Ontario on Sand river. At Albany, besides continuing to exercise an active supervision of affairs in the northern department, his influence among the Indians was

of great value. The failure of the Canada expedition excited much hostility toward Schuyler, and insinuations were uttered against his loyalty, which became so offensive that in the autumn of 1776 he sent in his resignation to Congress, which that body declined to accept; but the abuse continuing, Schuyler, in Apr., 1777, proceeded to Philadelphia and demanded a court of inquiry, which entirely approved his management of affairs, and he resumed command of the northern department. The forced abandonment of Ticonderoga by St. Clair, and his retreat to Fort Edward, where Schuyler had just arrived with re-enforcements, compelled the latter to fall back to Saratoga, after using every means to obstruct the advance of Burgoyne. The losses thus sustained in stores, ammunition, etc., caused a widespread consternation throughout the country, and the clamor against Schuyler was renewed, and this time Congress ordered his superseding by Gates. At the time of the latter's arrival (September) to assume command, Schuyler occupied a fortified position at the mouth of the Mohawk, to which he had fallen back from Saratoga. Gates had, since Schuyler's resumption of the command of the northern department, been unfriendly to Schuyler, and it was with feelings of mortification that the latter received the order deposing him at a time when the feeling of depression arising from former disasters had been dispelled by recent victories, and when volunteers were from all quarters swelling his army. He, however, obediently turned over his command and placed his successor in possession of full information of the situation, and, though without command, remained with the army to aid in any capacity, and was present at the surrender of Burgoyne. A court of inquiry again approved of his management in strong terms, but in Apr., 1779, he resigned, though continuing to render valuable service in the military operations in his native State. From 1778 to 1781 he was a member of the Continental Congress, and in 1789 was appointed U. S. Senator from New York, and again in 1797 to succeed Aaron Burr. In the New York Senate he contributed largely to the code of laws adopted by the State, and was an active promoter of the canal system. D. at Albany, Nov. 18, 1804. See his *Life and Times*, by B. J. Lossing (2 vols., 1860-62; new ed. 1872).

**Schuykill**, skool'kil [Dutch, liter., hidden channel, because unobserved by the first explorers]: a river which rises in Schuylkill co., Pa., and after a southeasterly course of 125 miles flows into the Delaware at Philadelphia, which city it traverses. Its lower portion affords extensive wharfage, and is of much commercial importance. The river was (1816-25) adapted to slack-water navigation for freight-boats to Port Carbon, 3 miles above Pottsville. The river affords the greater part of the water-supply for Philadelphia. It enters the Delaware between League island, containing a navy-yard, and Mud island, on which is Fort Mifflin.

Revised by I. C. RUSSELL.

**Schuylkill Haven**: borough; Schuylkill co., Pa.; on the Schuylkill river and canal, and the Lehigh Val., the Penn., and the Phila. and Reading railways; 4 miles S. of Pottsville, 31 miles N. N. W. of Reading (for location, see map of Pennsylvania, ref. 5-II). It is in an agricultural and coal-mining region, has large wharves and canal-boat docks for shipping coal, and contains rolling-mills, hosiery-works, railway car-shops, shoe and soap factories, and a weekly newspaper. Pop. (1880) 3,052; (1890) 3,088.

**Schwab**, shraap, GUSTAV: author; b. at Stuttgart, Germany, June 19, 1792; studied theology and philosophy at Tübingen; was appointed Professor of Ancient Literature in the gymnasium of Stuttgart in 1817; pastor at Gomaringen in 1837, and of the St. Leonhard church in Stuttgart in 1840, where he died Nov. 4, 1850. His poems show purity and warmth of feeling, though they do not possess the simplicity and classic perfection of form of Uhland's songs. Like the latter poet and other members of the Suabian school to which he belonged he wrote many ballads, some of which have become very popular. The first collected edition of his *Gedichte* appeared in 2 vols. in 1828-29; a second revised edition, *Neue Auswahl* (Stuttgart, 1838), has been often reprinted. Of his prose works, the most remarkable are *Schillers Leben* (Stuttgart, 1840; 3d ed. 1859); *Sagen des klassischen Alterthums* (Stuttgart, 1838-40; 14th ed. Güterslohe, 1882); *Deutsche Volksbücher* (1843; 13th ed. Güterslohe, 1880); and *Wegweiser durch die Litteratur der Deutschen* (Leipzig, 1846; 4th ed. 1870). See K. Klüpfel, *Gustav Schwab als Dichter und Schriftsteller* (1884).

Revised by JULIUS GOEBEL.

**Schwalbe**, shraal'be, GUSTAV ALBERT, M. D.: professor of anatomy; b. at Quedlinburg, Germany, Aug. 1, 1844; educated in the gymnasium at Quedlinburg, and at the Universities of Zurich, Bonn, and Berlin; became privat-docent at Halle Jan., 1870; professor at Freiburg in Baden May to Oct., 1871; professor extraordinary at Leipzig Oct., 1871, to Oct., 1873; ordinary Professor of Anatomy at Jena Oct., 1873, to Apr., 1881; held same position at Königsberg Apr., 1881, to Oct., 1883, when he accepted a chair at Strassburg. His principal works are *Lehrbuch der Neurologie* (1881) and *Lehrbuch der Anatomie der Sinnesorgane* (1887). He is editor of *Morphologische Arbeiten* (begun 1891), and has edited part i. of *Anatomy* (20 vols., 1872-92), and with Hoffmann and Hermann a *Yearly Report of Anatomy and Physiology*.

**Schwal'ber** [better known as CHELIDONIUS, the punning Græco-Latin translation of the German *Schwalbe*, a swallow; Gr. *χελιδών*]: a friend of Albert Dürer, and the author of the text in Latin verse to his three series of wood-cuts, *The Apocalypse*, *The Passion of Christ*, and *The Life of the Virgin Mary*. Schwalber was a monk of the abbey of St. Egidius (St. Julian, St. Gilgan, St. Giles), built by Conrad III. in 1140 for a society of Scotch Benedictines. He was nicknamed Musophilus, from his love of learning, and he had a reputation for considerable knowledge of the classical Latin poetry. While a member of this monastery he wrote the text for Dürer's wood-cuts, besides verses about his monastery, *Versic. de Fund. Cænob. Egid.*, and about the abbots, *Versic. de Abbat. nonnullis ejusdem Cænob.* In 1515 Schwalber left Nuremberg to become abbot in the Schotten Kloster, near Vienna. D. there Sept. 8, 1521.

**Schwann**, THEODOR: physiologist; b. at Neuss, Prussia, Dec. 7, 1810. He studied at the Jesuits' College, Cologne, at Bonn, Würzburg, and Berlin, where he graduated in medicine in 1834. He was assistant to Johannes Müller in the Anatomical Museum at Berlin till 1838. He discovered pepsin and its function in digestion, the envelop of nerve-fibers, the organic nature of yeast, and made a series of researches on muscular contractility, and other physiological subjects. He was Professor of Anatomy at the Roman Catholic University of Louvain 1838-48, and at Liège from 1848. D. at Cologne, Jan. 14, 1882. His cell-theory, which is the basis of modern histology, was published in *Microscopical Investigations on the Accordance in the Structure and Growth of Plants and Animals* (Berlin, 1839; trans. by Sydenham Society, 1847).

**Schwann, White Matter of**: See HISTOLOGY (*Nerves and Nerve-centers*).

**Schwanthaler**, shraan'thal'er, LUDWIG MICHAEL: sculptor; b. at Munich, Aug. 26, 1802, the son of a sculptor, studied in Rome, but wrought in Munich. His statues, decorations, and models, are seen in the great cities of Germany, but chiefly in Munich. He executed the frieze of the Barbarossa hall, the colossal statue of Bavaria, and the metopes of the Ruhmeshalle which adjoins it, the colossal bronze statues in the throne-room of the palace at Munich, and the monumental images in the Walhalla. D. Nov. 28, 1848.

**Schwartz**, shraarts, CHRISTIAN FREDERICK: missionary; b. at Sonnenburg, Prussia, Oct. 26, 1726; studied in the University of Halle 1746-49; was ordained at Copenhagen 1749; embarked at London for India, where he arrived July, 1750; settled at Tranquebar, a Danish mission on the Coromandel coast; transferred his services to the English Society for Promoting Christian Knowledge 1766, when he removed to Trichinopoly, and in 1778 to Tanjore; was sent as ambassador to Hyder Ali at Seringapatam to negotiate a peace, and admitted by him after all other envoys had been refused, and succeeded in relieving the city of Tanjore from imminent danger of famine by his influence with the native farmers, who brought in their cattle on his personal pledge of payment. D. at Tanjore, Feb. 13, 1798. He was one of the most celebrated missionaries of modern times. He and Schultz in translating the Bible into Tamil, and was tutor to the son and heir of the rajah of Tanjore, who erected to his memory in the mission church a magnificent monument designed by Flaxman; the East India Company also placed a monument of him by Bacon in St. Mary's church, Madras. See *Memoirs of his Life and Correspondence*, by H. Pearson, D. D. (2 vols., 1833; 3d ed. 1839).

**Schwartz**, MARIA SOFIA (*Birath*): novelist; b. at Braas, Sweden, July 4, 1819; was married in 1840, and became a widow in 1858. She was the author of a number of novels, all of which have been translated into German and

the elaborate and learned commentaries annexed; among the most valuable are Appian (3 vols., 1782-85); Polybius (8 vols., 1795; 5 vols., 1831, Oxford) with *Lexicon Polybianum*; Seneca's *Epistole* (2 vols., 1809); Epictetus (5 vols., 1799); Athenæus (14 vols., 1801-07); Herodotus (6 vols., in 12 parts, 1815), to which was added a *Lexicon Herodoteum* (2 vols., 1824); *Opuscula* (2 vols., 1806). D. at Strassburg, Jan. 19, 1830.

Revised by ALFRED GUEDEMAN.

**Schweinfurth**, shvîn'fôort: town of Bavaria; on the Main; 28 miles N. E. of Würzburg by rail (see map of German Empire, ref. 5-E). It is beautifully situated and well built, and has large manufactures of chemicals and pigments, especially ultramarine blue and Schweinfurth green. Large cattle and wool markets are held here. Pop. (1890) 12,438.

**Schweinfurth**, GEORGE AUGUST: explorer and botanist; b. at Riga, Russia, Dec. 29, 1836; studied botany and natural science at Heidelberg, Munich, and Berlin; made several journeys in the valley of the Nile to investigate the flora and fauna of those regions 1864 to 1886, and wrote *Plantas quædam Niloticæ* (1862); *Beitrag zur Flora Æthiopiens* (1867); *Reliquiæ Kotschyaræ* (1868); *Im Herzen von Afrika* (2 vols., 1874; translated into English as *The Heart of Africa* in 1874); *Artes Africanæ* (1875), etc.

Revised by M. W. HARRINGTON.

**Schweinfurth Green**, or **Paris Green**: a pigment said to have been discovered by Ruz and Sattler at Schweinfurth in 1814, but there is reason to believe that it was manufactured at Vienna at an earlier date under the name of *Mitis green*. Other names are *Imperial*, *Vienna*, *Emerald*, and *Kaiser Green*. Some varieties of berg or mountain green and of Newied green consist of this pigment mixed with gypsum or heavy spar. The first chemical paper by Justus von Liebig related to this color; it was published by him in July, 1822, in the *Repertorium der Pharmacie*.

Schweinfurth green is an aceto-arsenite of copper of variable composition. It has been very extensively used for wall and other paper staining, for tarlatans, artificial flowers, and as a vermin exterminator, especially for cockroaches and potato-bugs. Its use for wall-paper has greatly diminished. Much has been written with regard to the dangers of arsenical wall-paper. It has been alleged that not only may green papers, to which the pigment is loosely attached, give off arsenical dust, which may enter the mouth and air-passages and produce harm, but that paper containing even very small quantities of arsenic, in any form, may evolve arseniuretted hydrogen or other arsenical gases of a very poisonous character. Distinguished chemists, however, deny the possibility of the production of any arsenical gases from wall-paper, and the alarming suggestions concerning arsenical wall-paper are regarded as entirely without foundation.

Revised by IRA REMSEN.

**Schweinitz**, EDMUND ALEXANDER, de, S. T. D.: bishop; son of Lewis David von Schweinitz; b. at Bethlehem, Pa., Mar. 20, 1825; studied theology in the Moravian seminary of his native town and at the University of Berlin; became a clergyman, and was pastor of several churches in Pennsylvania; edited *The Moravian* for several years; consecrated bishop at Bethlehem 1870; was president of the Moravian College and Theological Seminary 1867-84; was one of the translators of Herzog's *Realencyclopædie* (Philadelphia, 1856, seq.), and author of *The Moravian Manual, being an Account of the Moravian Church* (Philadelphia, 1859; 2d ed. Bethlehem, 1869); *Systematic Beneficence* (1861); *The Moravian Episcopate* (Bethlehem, 1865; 2d rev. ed. London, 1874); a *Life of Zeisberger, the Western Pioneer and Apostle to the Indians* (Philadelphia, 1870); and *The History of the Church known as the Unitas Fratrum* (1885). D. Dec. 18, 1887.

**Schweinitz**, GEORGE EDMUND, de, A. M., M. D.: ophthalmologist; son of Bishop de Schweinitz; b. in Philadelphia, Pa., Oct. 26, 1858; educated at the Moravian College, Bethlehem, Pa., and at the University of Pennsylvania, where he graduated in 1881; prosector of anatomy in the university 1883-88; lecturer on medical ophthalmology 1891-92; Professor of Ophthalmology, Philadelphia Polyclinic, 1891; Clinical Professor of Ophthalmology, Jefferson Medical College, Philadelphia, 1892; ophthalmic surgeon to Children's, Philadelphia, Methodist, and Orthopaedic Hospitals. His principal published works are *Congenital Anomalies of the Eye in American System of Ophthalmology* (1889); *Affections of the Eyelids, Lachrymal Apparatus, Conjunctiva, and Cornea in Cyclopædia of Diseases of Children* (vol. iv., 1890); *Affec-*

*tions of the Conjunctiva, Cornea, and Sclera in System of Therapeutics* (1892); *Diseases of the Eye: a Handbook of Ophthalmic Practice* (Philadelphia, 1892). He was editor, with Dr. Hare, of *The University Medical Magazine* Oct., 1888-Sept., 1889, and of the same journal with Dr. E. Martin Oct., 1889-Sept., 1891. Since 1892 he has been ophthalmic editor of *The Therapeutic Gazette*.

**Schweinitz**, LEWIS DAVID, von, Ph. D.: botanist; b. at Bethlehem, Pa., Feb. 13, 1780; educated in Germany, where he resided from 1798 to 1812; Moravian minister at Salem, N. C., 1812 to 1821; settled in his native town 1821, and resided there until his death Feb. 8, 1834. He added by his own researches more than 1,400 new species to the catalogue of American flora, the greater part being fungi which had been previously little studied. He was the author of *Conspectus Fungorum in Lusatia superioris agro Niskiensi crescentium e methodo Persooniana* (with Albertini, 1805); *Synopsis Fungorum Carolina superioris, etc.* (1822); *Synopsis Fungorum in America Boreali media degentium* (1831-34); and monographs on *Viola*, *Carex*, and other genera.

Revised by CHARLES E. BESSEY.

**Schweizer-Sidler**, shvît'ser-zid'ler, HEINRICH: Latinist; b. at Elgg, Switzerland, Sept. 12, 1815; educated at Zurich; teacher in gymnasium of Zurich, docent in the university, and professor from 1871; author of *Elementar- und Formenlehre der lateinischen Sprache* (1869; 2d ed. as *Grammatik der lateinischen Sprache*, 1888); *Germania of Tacitus* (5th ed. 1890); and numerous articles in journals. D. at Zurich, Mar. 31, 1894.

B. I. W.

**Schwenk'feld**, HANS KASPAR, von: sectarian leader; b. at Ossig, Silesia, 1490; employed in the service of the Duke of Liegnitz; embraced the Reformation with great enthusiasm, but developed afterward its ideas in a manner which brought him in conflict with the Reformers. It was especially his conception of the Lord's Supper as a sacrament of spiritual nourishment without change in the elements and his demands for the establishment of a Church to which only the saints, the truly converted, should be admitted, which gave offense. His teaching was known as The Middle Way. Political pressure having forced the Duke of Liegnitz to adopt Lutheranism, Schwenkfeld voluntarily left Silesia (1529) and went to Strassburg. There he was suspected of Anabaptism, tried, and banished (1533). The next two years were passed in Augsburg, but again Lutheran antagonism drove him away and he went to Ulm, and from there as a center went about preaching. D. at Ulm, Dec. 10, 1561. In his *Grosse Confession* (1540-57, 3 parts) he gave a representation of his doctrines. An edition of his numerous writings appeared at Frankfort 1564-70 in 4 vols. folio. A sect, the Schwenkfelders, was organized in Silesia, but most of them emigrated in 1734 and settled in Pennsylvania, where they number about 1,000 members, and have their own churches and schools. See O. Kadelbach, *Ausführliche Geschichte Kaspar von Schwenkfelds und der Schwenkfelder in Schlesien, der Ober-Lausitz und Amerika* (Lauban, 1861).

Revised by S. M. JACKSON.

**Schwerin**: capital of the grand duchy of Mecklenburg-Schwerin, Germany; on the western side of Lake Schwerin (see map of German Empire, ref. 2-F). It is connected by railways with Hamburg and Wismar, and is beautifully situated, surrounded with old walls, generally well built, and contains many magnificent buildings, among which the ducal palace is the most remarkable. It has good educational institutions, museums, galleries, and collections, and numerous manufacturing establishments. Pop. (1890) 33,643.

**Schwerin**, KURT CHRISTOPH, Count von: soldier; b. in Swedish Pomerania, Oct. 26, 1684; studied at Leyden, Greifswald, and Rostock; entered the Dutch army in 1700, and fought at Ramillies and Malplaquet; took service with the Grand Duke of Mecklenburg in 1706, and distinguished himself by repelling the Hanoverians, who invaded the country; after that part of Pomerania in which his estates were situated was ceded to Prussia, he entered the service of that country, and was sent by Frederick William I. on several important diplomatic missions. He enjoyed in a still higher degree the confidence of Frederick the Great, who raised him to the rank of field-marshal and gave him the title of count. He won the battle of Mollwitz Apr. 10, 1741, in the first Silesian war, stormed Prague Sept. 16, 1744, in the second, and fell in the battle of Prague May 6, 1757, in the Seven Years' war. See Varnhagen von Ense, *Biographische Denkmale* (Leipzig, 1873).

F. M. COLBY.

Science.—There is no matter, All is Mind. Christian Science defines Soul and dreams. In truth Soul is God. In error soul is sense. Dreams are the conscious and unconscious states of matter; wherein the night dream is quite as real and tangible as the day dream; for Life or mind in matter, is a dream at all times, and is never the reality of Being.

That matter is substance, or includes mind, is pantheism which has no kinship with Christ. Spirit must be substance, since matter is neither the substance of Spirit, nor its reflex universe.

Man's origin is not material but spiritual. The universe is not the result of physical propulsion, but is an evolution from infinite Mind. "God is Spirit," Truth. As matter is the opposite of Spirit, Truth, so must it be the opposite of God. Matter is the subjective state of error, deflecting from the everlasting uprightness, and eventuating in false personal beliefs in sin, disease, and death, only to be overcome by conquering Truth,—eradicated not by drugs or hygienic rules, that is, laws of matter, but by the power of Mind. Jesus, referring to this original evil, which he cast out in healing the sick, called it "the devil," and "a liar from the beginning."

This theory is corroborated by Jesus' supremacy over all phases of matter,—a control not supernatural, but divinely natural, in one abiding in God, Good, the centre and circumference of the universe. From this it follows that genuine healing must be wrought upon thought, not body. When following these leadings of scientific Revelation the Bible was the writer's only text book.

Practically Christian Science is the fulfilling of the law of Love, namely, loving God supremely, loving your neighbor as yourself, and loving your enemies.

These doctrines were brought into modern light by the present writer, in the years 1866-7. When apparently near death, her convictions laid hold upon the sublime verity that all evil, whether moral or physical, must be non-existent because contrary to the omnipotent Good, God. She found in the Bible a new meaning, whereby she was snatched from the Valley of shadows, and her feet set on the Rock. As it was through this understanding of God, through Christ, God's idea, that all healing must come, she adopted Christian Science as the name of this curative system.

In 1867 she began healing others with wonderful success, and taught her first student.

Her textbook, *Science and Health with Key To The Scriptures*, is the outgrowth of her experience, and was first published in 1875. On July 4th, 1876, the first Christian Scientist Association was organized. In June, 1879, the first Church of Christ, Scientist, was founded in Boston, with twenty-six members, the writer becoming its pastor, though she did not receive ordination till 1881. This Mother Church has, in 1895, a membership of five thousand one hundred in different parts of the country, about eight hundred being local residents. During the same year she founded her Massachusetts Metaphysical College in Boston, the laws then enabling her to obtain a charter for medical instruction; though no such privileges were granted after 1883. She started in 1883, as editor and proprietor, *The Christian Science Journal*, still the official organ of the Scientists. The first National Association was convened in New York, on February 11, 1886, and still meets, though discarding organized action.

The first denominational chapel was erected at Oconto, Wisconsin, in 1886, and has been followed by others. In 1894 the Boston Church completed a beautiful edifice, as a Testimonial to the writer of this. It was dedicated on Jan. 6th 1895, and cost, including the land, nearly two hundred and fifty thousand dollars. In 1894, it was estimated that in Europe and America there were at least two hundred thousand disciples, while half a million people more attest its power. In the U. S., in 1894, there were three hundred societies meeting regularly for worship, twenty-six teaching institutes, and sixty-six dispensaries and reading rooms.

The Christian Science Publishing Society, issues *The Christian Science Journal*, the *Quarterly Bible Lessons*, and many tracts, some in German and Norwegian. The writer's works include *Science and Health with Key to the Scriptures* (already mentioned), *Retrospection and Introspection* (1891), *Christ and Christmas*, a poem, illustrated (1893), *Pulpit and Press* (1895), *Unity of Good and Unreality of Evil* (1897), *No and Yes* (1891), *Rudimental Divine Science* (1891), *People's Idea of God* (1886), and *Christian Healing* (1886).

MARY BAKER EDDY.

Though numerous books and pamphlets purporting to deal with Christian Science have been published, Mrs. Eddy and her followers recognize as authoritative only those enumerated above.

ROBERT LILLEY.

**Scientific Schools:** See *Technical Schools*, under *SCHOOLS*.

**Scilla:** See *SCYLLA*.

**Scilly (sil'lee) Islands (anc. Cassiterides):** a group of islands belonging to Great Britain, situated 30 miles W. of Land's End, the southwestern promontory of Cornwall. It consists of 140 isles and rocks, of which six are inhabited—St. Mary, Treco, St. Agnes, Sampson, Bryher, and St. Helen's. Total area, 3,560 acres. Pop. about 2,500, of whom about 1,300 live on St. Mary, where Hugh Town, the capital, is situated. On St. Agnes is a lighthouse; and on Bishop Rock, 6 miles westward, is one of the finest lighthouses of its kind. All

the islands are rocky, consisting of granite with a thin layer of light sandy soil. Agriculture and fishing are the principal occupations; good crops of barley, oats, and potatoes are raised. The navigation around these isles is very dangerous. In 1705 the fleet under Admiral Sir Cloudesley Shovel fell upon these rocks, when his ship and several others were lost.

Revised by M. W. HARRINGTON.

**Scin'cidae** [Mod. Lat., named from *Scin'cus*, the typical genus, from Lat. *scin'cus* = Gr. *σκινκος*, *σκινκος*, a kind of lizard]: an extensive family of lizards of the group *Leptoglossa*. As limited by Gray, it includes those forms in which the body is subcylindrical or fusiform, and with the tail cylindrical or tapering; the scales generally smooth, but sometimes keeled or striated; the head sub-quadrangular and regularly shielded, with the rostral plate moderate, and the nostrils lateral, and in a special nasal shield interposed between the frontal and labial shields; the limbs variable in development, typically four, generally more or less weak, sometimes atrophied. According to Prof. Cope, the temporal fossa is roofed, the premaxillary double, the palatine maxillary laminae dilated, and rarely a xiphisternal fontanelle is developed. The tongue is short, flat, and squamous. The family embraces numerous genera, distributed in almost all parts of the world. There is every gradation in the development of the members, from those forms in which the limbs are quite strong and provided with five digits each, to those in which they are entirely wanting, and the number or development of these parts is of comparatively little systematic value in the group. The family is well represented in the U. S. chiefly by species of the genus *Eumeces*.

Revised by F. A. LUCAS.

**Scinde:** a province of India. See *SINDH*.

**Scio, or Chios (Turk. Sakiz Adasi):** island; in the Aegean, in the latitude of Smyrna, and separated from the western extremity of Asia Minor by a strait less than 5 miles wide where narrowest; 32 miles long from N. to S., and from 18 to 8 from E. to W.; area, 579 sq. miles. It is rocky, but so fertile and beautiful as to justify its title of Queen of the Aegean. Water-springs abound. There are few forests near the coast, but the interior of the island is covered with firs. Toward the south there are remarkable plantations of mastic-trees, the culture of which furnishes the main support of twenty villages, and from which a valuable hygienic gum is obtained. Its many harbors render the island easy of access from every direction. The Ionians colonized Scio about 1130 B. C., and it formed a part of the Ionian confederacy. It heroically resisted the Persians, from whom it was delivered by the treaty of Cimon (449 B. C.). During the Peloponnesian, Roman, and mediæval wars, it experienced many vicissitudes. Under the Genoese it enjoyed prosperity from 1346 until 1566, when it was conquered by the Ottoman admiral Piali Pasha. As the private property of the sultana, the island was mildly governed, and the inhabitants became unwarlike and effeminate, and were undisposed to join in the struggle for Greek independence. Hence the atrocious massacre of Apr., 1822, was without provocation and almost without pretext. The Ottomans slew or enslaved 30,000 persons; 20,000 who escaped were scattered over the world, some even reaching America, and by August the population had shrunk to 10,000. Scio has suffered much from frequent earthquakes, yet the industry and intelligence of the people have largely restored their former prosperity. Pop. 70,000, of whom 68,000 are Greeks, and 1,200 Mussulmans. Scio, the capital, was founded by the Genoese at the extremity of the plain of Cambos. It has dockyards and a good harbor, and is the maritime center of the Archipelago. The principal exports are lemons, oranges, olives, almonds, anise, beans, mastic, and worked leather.

E. A. GROSVENOR.

**Scioptius**, scî-ôp'pî-ô-s (*Kaspar Schopp*): classical scholar and controversialist; b. at Neumark, in the Palatinate, May 27, 1576; studied at Heidelberg, Altdorf, and Ingolstadt; visited Italy, Bohemia, Poland, and Holland; abjured Protestantism and became a Roman Catholic in 1598. His fanatical propaganda earned for him the titles of Duke of Clara Valle in Spain and patrician of Rome. His virulent invectives against the Jesuits and Joseph Scaliger (see *SCALIGER*, JOSEPH), and his insane diatribes against Cicero, Varro, and many post-Augustan writers, alienated even his own partisans, so that he was compelled to publish many of his polemical writings under an assumed name. He died in Padua, Nov. 19, 1649. Among his scientific writings may be mentioned his *Grammatica philosophica*

which rises from the general level and forms a dead wall in front of the orbit; post-orbital processes are more or less developed; the lower jaw has its descending ramus subquadrate, the upper angle acute and sub-erect, and the lower rounded or subtruncate and bent inward; molar teeth  $\frac{1}{2} \times 2$ , provided with roots, and (except the anterior upper one when present) of nearly equal size, with tubercular crowns; perfect clavicles are developed; the hind limbs moderately large; the fibula and tibia separate from each other. At least 150 species are known, represented in almost all quarters of the world, except Australia. There are all gradations, between the slender and graceful form of the squirrel and the heavy, almost bear-like, form of the woodchuck. This transition is manifest from the arboreal squirrels (*Sciurus*) through the ground-loving *Tamias* with well-developed tails; the *Spermophilus*, or prairie-squirrels, with shorter tails; *Cynomys*, or the prairie-dogs, with stouter forms; and *Arctomys*, or the woodchucks, with still more robust forms.

**Sclater, PHILIP LUTLEY, Ph. D., F. R. S., F. L. S.**: ornithologist; b. at Hoddington House, Hampshire, England, Nov. 4, 1829; educated at Winchester College and Corpus Christi College, Oxford, graduating in 1849; took a first class in mathematics, and subsequently became a fellow; was called to the bar at Lincoln's Inn in 1855, and practiced in the western circuit for several years. In 1859 he became secretary to the Zoological Society in London, and in 1860 editor of *The Ibis*, positions which he has held ever since. He is a member of the council of the Royal Geographical Society, and from 1877 to 1882 was one of the general secretaries of the British Association. He has published about 1,000 papers on ornithology and other branches of natural science. Among his more important works are *Monograph of the Tanagrine Genus Calliste* (1857); *Monograph of the Jacamars and Puff-birds* (1882); *Nomenclator Avium Neotropicalium* (1872); *Catalogue of Birds in the British Museum*, vol. xi., *Certhiidae, Tanagridae, and Icteridae* (1886), vol. xiv., *Oligomyzidae* (1888), vol. xv., *Tracheophones* (1890).

F. A. LUCAS.

**Scleren'chyma**: See HISTOLOGY, VEGETABLE (*Stony Tissue*).

**Scleroder'ma** [Mod. Lat.; Gr. σκληρός, hard + δέρμα, skin]: a sub-order of plectognath fishes, in which the bones of the upper jaw are but imperfectly united, the teeth independently developed, and the scapular arch, with the hypocoracoid and hypercoracoid bones both developed. The form is typically fish-like, in which respect the species differ much from the other members of the order. The dermal armature is developed in the form of small scale-like plates or bristles; the dorsal fin is represented by from one to six spines; the pelvic elements are well developed. To the group thus distinguished belong two well-defined families—*Triacanthidae*, including the most fish-like forms, and *Balistidae*, comprising the more aberrant species.

**Sclerotica**: See EYE.

**Selo'pis, FEDERIGO PAOLO, Count**: politician and writer on historical law; b. at Turin, Italy, Jan. 10, 1798; took his legal degree in the university of his native city in 1818, and in 1827 gave his first historical lecture, *I Longobardi in Italia*, before the Turin Academy of Sciences. This was followed by *La Storia dell' Antica Legislazione nel Piemonte* (Turin, 1833); *La Storia della Legislazione Italiana* (4 vols., Turin, 1840-64); *Ricerche Storiche sopra le Relazioni Politiche tra la Dinastia di Savoia ed il Governo Britannico* (Turin, 1853). In 1845 he was elected corresponding member of the Institute of France, and in 1869 foreign member of the same; in 1847 was made president of the superior commission of press censorship in Piedmont; in Mar., 1848, accepted the portfolio of justice; in 1849 was named senator, and from 1861 to 1864 was president of the Italian Senate; was also elected president of the Turin Academy of Sciences. In 1868 Victor Emmanuel bestowed upon him the highest order of the kingdom, that of the Annunziata; in 1871, being selected as representative of Italy in the congress of arbitration which assembled at Geneva for the settlement of the Alabama question, he was elected president of this congress, and performed the duties of his office with signal ability. D. Mar. 8, 1878.

Revised by F. STURGES ALLEN.

**Sclot, BERNAT**: See D'ESCLOT, BERNAT.

**Scollard, CLINTON**: poet; b. at Clinton, N. Y., Sept. 18, 1860. He graduated at Hamilton College 1881, and studied in the graduate department of Harvard University and for

a short time at Cambridge University, England. In 1888 he was chosen Assistant Professor of Rhetoric at Hamilton College, and subsequently Professor of English Literature. He has published *Pictures in Song* (1884); *With Reed and Lyre* (1886); *Old and New World Lyrics* (1888); *Giovio and Giulia* (1891); *Songs of Sunrise Lands* (1892); and an edition of Ford's *Broken Heart* (1895).

H. A. B.

**Scolopac'idae** [Mod. Lat., named from the genus *Scolopax*, from Lat. *scolopax*, *scolopacis* = Gr. σκολοπάξ, σκολοπακος, snipe, woodcock]: a family of wading birds, including snipe, woodcock, sandpipers, and related forms. The bill is long and slender, rather soft and flexible, and with the sides compressed and grooved to the tip, which is blunt; the lower mandible has no angle at its lower margin; the nostrils are basal, elongated, and situated in a groove closed by a membrane; the wings are long and pointed, the first or second primary being longest; the tail is usually short and even; the legs elongated; the thighs exerted and naked; the tarsi elongated and slender; the toes moderately long and attenuated, the anterior being connected more or less by a basal membrane, the hinder short or wanting. Some members of the family are found in uplands far from water, and others in inland forests. See CURLEW, SANDPIPER, SNIFE, WOODCOCK, etc.

THEODORE GILL.

**Scomberesoc'idae** [Mod. Lat., named from *Scomberesox*, the typical genus; Lat. *scomber*, from Gr. σκόμβρος, mackerel + Lat. *esox*, *esocis*, pike]: a family of fishes comprising the flying fishes, half-beaks, and other remarkable forms. The body is more or less elongated, the scales are cycloid, a lateral peak developed along each side of the belly; the head is more or less quadrangular and flattened above; the jaws are very variable in development, sometimes very much elongated, and sometimes short and subtruncate; the upper is constituted by the intermaxillaries at the middle and the maxillaries at the sides; the teeth are variable in development; the branchial apertures confluent below; branchiostegals in considerable number; the dorsal fin single and far back, composed mostly of branched rays; anal fin opposite the dorsal; caudal distinct and generally emarginated, and with its lower lobe longest; pectorals with branched rays and variable in development; ventrals abdominal. The air-bladder is generally present, but is shut off from any communication with the intestinal canal; the pseudobranchia are hidden and glandular; the stomach is not distinct from the intestine, which is straight and without pyloric appendages. The species are mostly inhabitants of the tropical seas.

Revised by F. A. LUCAS.

**Scom'bridae** [Mod. Lat., named from *Scomber*, the typical genus, from Lat. *scomber*, from Gr. σκόμβρος, mackerel]: an important family of fishes, including the mackerels, tunnies, bonitoes, and related forms. The body is elongated and fusiform; the scales very small or wanting (generally cycloid, but about the thorax larger and sometimes ctenoid ones are developed, which form the so-called corselet of the tunnies); dorsal fins two, the first composed of rather slender spinous rays, the second with branched rays, the posteriors of which are free and developed as finlets; anal similar to the second dorsal; caudal forked, and well adapted for powerful propulsion; pectorals pointed; ventrals thoracic, each with one spine and five rays; numerous (more than twenty-five) vertebrae; numerous pyloric caeca developed. The species vary in size from the dimensions of a small mackerel to those of the great tunny, which sometimes attains a weight of over 1,000 lb. Some are great wanderers. In the summer of 1871, for example, there appeared suddenly on the coast of Massachusetts large numbers of a small tunny (*Orcynus aliteratus*) which had previously been unknown along the coast of America, although familiar as a Mediterranean fish. See MACKEREL and TUNNY.

**Scop'as** (Gr. Σκόπας): sculptor; b. in the island of Paros, flourished B. C. 390-350, and was one of the most celebrated of Grecian artists. He worked mostly in marble, the product of his native place, and chose his favorite subjects from the myths of Dionysus and Aphrodite. With Praxiteles, he formed the character of the second or later Attic school of sculpture, in contradistinction to the earlier school of Phidias. He was celebrated also as an architect, and constructed the temple of Athena Alea at Tegea, and engaged with Leochares and others in embellishing the mausoleum at Halicarnassus. The statement that he assisted in the erection of the temple of Artemis at Ephesus rests on a doubtful passage of Pliny. Among the most noted works ascribed to Scopas were a statue of Aphrodite Pandemos in Elis, one of Apollo Smin-

Laing, vol. ii.), in Calderwood's *History of the Kirk of Scotland*, in Dunlop's *Collection of Scotch Confessions* (vol. ii.), in Niemeyer's *Collectio Confess. Reform.*, and in Schaff's *Credo of Christendom* (vol. iii.).

**Scoter**: any sea-duck belonging to the genus *Oidemia* of Fleming. The species are distinguished by the bill being much swollen at the base, with the terminal part depressed and broad, and the extension of the feathers of the chin forward as far as the nostrils. The color is to a great extent black. The American species are *Oidemia americana* (the common scoter), *O. fusca* (velvet scoter), *O. perspicillata* (commonly called surf-duck or sea-coot), and *O. deglandi* (the velvet duck or white-winged coot).

**Scotists**: among the SCHOOLMEN (*q. v.*), the followers of John Duns Scotus. Their principal adversaries were the Thomists. The Scotists held to freedom of the will and the immaculate conception of the Virgin. Franciscans were generally Scotists; the Dominicans, Thomists.

**Scotland**: that part of Great Britain which lies N. of the Cheviot Hills and the Tweed. It is bounded on the N. and W. by the Atlantic Ocean, on the E. by the North Sea, on the S. by England and the Irish Sea. Its greatest extent, from Dunnet Head in the N. (58° 41' N.) to the Mull of Galloway (54° 38' N.), is 288 miles. The area is 29,785 sq. miles, of which the islands comprise over one-seventh.

**Coast**.—The development of the coast-line is very considerable in proportion to the area of the kingdom, for it amounts to 2,300 miles, which gives 1 mile of coast-line to every 12 sq. miles of area. No point of the country is farther than 40 miles from the sea.

No contrast could be greater than that between the east and west coasts. The former resembles that of England. It is generally formed of soft sandstones and clays and generally low and shelving, although marked by a few bold headlands, such as Duncansby Head, Tarbat Ness, Kinnaird Head, Buchan Ness, Fife Ness, and St. Abb's Head. Its indentations, including the Firths of the Forth and the Tay, and the Moray Firth, which bifurcates into Loch Beaulieu and Cromarty Firth, are few, but they penetrate far inland, and form the estuaries of comparatively important rivers. The west coast, on the other hand, as far S. as the Firth of Clyde, is formed of hard rocks, rises boldly from the sea, and is intersected by numerous narrow sea-lochs, bounded by steep hills, and separated from each other by mountainous peninsulas. The most considerable of these peninsulas is that of Kintyre or Cantyre. It is nearly 60 miles in length and terminates in the Mull of Kintyre. Narrow sounds separate the mainland from Skye, Mull, and others of the Inner Hebrides; and a broad strait, the Minch, separates these from the Outer Hebrides, or Long Island.

The eastern coast of the Firth of Clyde is generally level, while that of the peninsula of Galloway, farther S., is generally steep, and juts out in the Mull of Galloway, the most southerly point of Scotland, in lat. 54° 38' N. The northern coast, between Duncansby Head and Cape Wrath, is wild and rugged and marked by bold headlands.

**Relief**.—In its broad features Scotland may be divided into a highland region in the north, a lowland plain in the center, and an upland region in the south. The Highlands are cleft in two by a long and narrow valley, the Great Glen (Glenmore), which extends along an anticlinal axis from Loch Eil to the Beaulieu Loch. This valley is occupied by a chain of lakes connected by the Caledonian Canal, and its summit-level is only 105 feet above the level of the sea. The mountain region to the N. of this glen is, for the most part, sterile and inhospitable and very thinly peopled. Lofty mountains lift their summits above its extensive moors, the most considerable being Ben Dearg (3,547 feet), Ben Wyvis (3,929 feet), and Mam Soul (3,862 feet). Toward the N. E. this mountain region merges into the undulating sandstone plains of Caithness, which form bold and striking headlands on the coast.

The mountain region to the S. of Glenmore is known as the Grampians. In its arrangement it is much more linear than the Northern Highlands. A central chain can be traced from Ben Nevis (4,406 feet) in the southwest to the coast of Aberdeen. The Pass of Drumochter, on the confines of Perthshire and Inverness, crosses this chain at an elevation of 1,488 feet. The Northern Grampians branch off from the central chain near the head-waters of the Dee, and attain an elevation of 4,296 feet in Ben Macdui. The Southern Grampians culminate in Ben Lawers, 3,984 feet. The Grampians are almost as sterile as the Northern Highlands, and

moors abound, but there are excellent pastures in the valleys; and where these open out toward the N. E. and S. E. they offer every facility for a successful pursuit of agriculture. The western coast of the Highlands is generally steep and rugged, and sea-lochs penetrate far into the land; their interior abounds in picturesque lakes. Strathmore (the great vale) extends along the foot of the Highlands from Loch Lomond, in the southwest, to Stonehaven, in the northeast. It is separated from the sea and the great central plain extending between the Forth and the Clyde by a series of hills broken through by the Forth and Tay, and known as the Campsie Fells, the Ochil Hills (2,363 feet), and the Sidlaws (1,399 feet). Southern Scotland consists of an extensive hilly region stretching from St. Abb's Head on the German Ocean to Stranraer on the Irish Sea, and culminating in the Broad-Law (2,754 feet) and the Merrick (2,764 feet). The valleys of the Tweed and Clyde almost cut off from the main mass the outlying ranges of the Lammermuir and Pentlands Hills toward the N. The range forming the boundary toward England is known as the Cheviots (2,636 feet). The southern hills are generally broad and flat; they are intersected by deep grassy glens, which open out into fertile valleys and plains. Among the latter that called the Merse, at the mouth of the Tweed, is the most considerable.

The western islands are generally of considerable height (Ben More, on Mull, 3,185 feet); the Orkneys and Shetlands, though they present bold cliffs toward the sea, and are much broken up by intricate channels, rise to a height of only 1,600 and 1,475 feet respectively.

**Geology**.—The rocks are chiefly of Palaeozoic age. The clay and chlorite slates and the graywacke, interstratified with mica-schist and gneissose flagstones, which form nearly the whole of the Highlands, are classed by Prof. A. Geikie as metamorphosed Lower Silurian. On the west coast there occur sandstones of Cambrian age, while crystalline gneiss, equivalent to the Laurentian rocks of North America, occupy the Outer Hebrides and the west coast of Sutherland. These rocks are frequently broken through by igneous rocks, which form some of the highest summits. Granites predominate, but porphyry is found in the southwest, and basalt is highly developed on the islands of Skye and Mull. On the S. E., from the Clyde to Stonehaven, around Moray and Dornoch Firths and in Caithness, these Silurian rocks of the Highlands are bounded by flagstones and sandstones of the Devonian formation, which prevails in the Orkneys, while the Shetlands exhibit the geological features of the Highlands.

The great lowland plain is occupied by limestones and coal-measures of the Carboniferous system, the hills being largely formed of porphyritic rocks and basalt. Tuff and volcanic agglomerate occur in various localities. A narrow belt of Devonian rocks separates these lowlands from the southern uplands, whose graywacke and shale of Silurian age, pierced by masses of porphyry (Cheviots) and granite (on the west), are the prevailing rocks. Indications of an ancient glaciation are frequent. Subsequently an upheaval of the country, evidenced by raised beaches, took place. Scotland is rich in coal and iron. Lead is found in the southern hills. Excellent building-stones abound. Aberdeen is known for its granite; Craigleith for its freestone. Scotch pebbles, garnets, amethysts, and other precious stones are among the minor products of the mineral kingdom.

**Hydrography**.—The rivers rise in the hills, and frequently pass through mountain lakes. Their course is more rapid than that of the rivers of England. The water-parting being near the west coast the rivers of the eastern slope are much the longest. The Tweed is a rapid stream, forming in its lower course, the boundary between England and Scotland, and entering the German Ocean at Berwick. The Forth, though an inconsiderable stream, deserves to be mentioned because of its firth. It is navigable to Stirling. The Tay is the most important river of Scotland. It rises to the N. of Loch Lomond, flows through Loch Tay, leaves the mountains at Dunkeld, intersects the Strathmore, and finally enters the Firth of Tay. It is navigable as far as Perth. The remaining rivers, with the exception of the Clyde, are of little use to navigation, but they abound in fish. The Clyde rises in a small lake on the southern confines of Lanarkshire, and enters the Firth of Clyde below Glasgow. Its current is very rapid, and it forms several waterfalls, but at a vast expense for dredging it has been made navigable for large vessels as far as Glasgow.

Scotland abounds in lakes. They are almost without exception in the Highlands and collectively cover an area of

**Manufactures.**—These are of considerable importance, especially in the lowlands. The textile industry (1891) gave employment to 206,550 persons, and there were 747 factories with 2,413,735 spindles, 71,471 power-looms, and 154,591 hands. The cotton industry has its centers at Glasgow and Paisley; the woolen manufacture is carried on at Hawick and Galashiels on the Tweed, but also in Stirling, Kilmarnock, and Bannockburn; carpets are made at Kilmarnock and Glasgow; Dundee and Dunfermline are the principal seats of the linen, hemp, and jute industries. Knitting is widely carried on as a domestic industry. The making of machinery, which employs 51,426 men, and ship-building (23,518 workmen) have their chief seats on the Clyde, where the largest ocean steamers and ironclads are built. Other industries of importance are printing (20,317 workmen), paper-making, sugar-refining, the preserving of provisions, glass-making, and the manufacture of chemicals.

**Commerce.**—Glasgow is the commercial capital of the country, although as a shipping-port it ranks seventh in the United Kingdom, being preceded not only by London or Liverpool, but also by Cardiff, Hull, Newcastle, and Southampton. The railways at the end of 1893 had a length of 3,215 miles, and there were also 86 miles of tramway and 153 miles of canal. For further details, see GREAT BRITAIN.

**National Wealth.**—In 1886 the total value of property and profits assessed by the income-tax amounted to £59,406,708; in 1893 to £65,606,195 (all incomes of less than £150 are exempt). This increase, however, did not extend to the owners or occupiers of lands and tenements. The number of depositors in savings-banks (1893) was 596,179, and £12,583,676 stood to their credit, an increase of £4,338,681 since 1883. In 1892 there existed 342 co-operative industrial and provident societies, with 195,919 members, a capital of £2,983,303, and a turn-over of £9,743,238; and 61 building societies employing a capital of £976,255. On the other hand, in Jan., 1894, there were 61,978 paupers with 33,218 dependents (2·3 per cent. of the total population).

**Religion.**—Scotland, since 1560, has an Established Church, organized on the Presbyterian system, and now governed by 1,348 parochial kirk sessions of ruling elders, with the minister as moderator; 84 presbyteries, 16 synods, and a General Assembly which meets annually in May. It claims 604,984 communicants, and about 45 per cent. of the entire population are claimed to adhere to it. Since 1874 its ministers are elected by the congregations. This question of patronage led in 1843 to a secession and the foundation of the Free Kirk, with 1,260 ministers and missionaries, 1,050 churches, 343,069 communicants, and the adherence of 34 per cent. of the population. There are several other bodies of Presbyterians (e. g., the United Presbyterian Church, with 615 ministers, 573 churches, 48 home mission stations, and 188,706 members), as well as an Episcopal Church, which temporarily, 1662-88, enjoyed the advantages of establishment, although it numbered very few adherents. It now has 7 bishops, 268 churches and missions, and 266 clergy. The Roman Catholics are supposed to number 365,000 souls, and besides the Irish in the towns they embrace the inhabitants of the islands of Barra, South Uist, Eigg, and Canna, and of a few Highland valleys. See SCOTLAND, CHURCH OF.

**Education.**—Scotland has long been in advance of England in educational matters, more especially as regards secondary education. Since 1872 all public, elementary, and middle-class schools are administered by school boards, and education is free for all children between the ages of five and fourteen. In 1893 there existed 3,005 of these schools, attended by 617,448 children. In addition to these there are numerous superior schools in the enjoyment of endowments or supported by public bodies, the more famous among these being the Edinburgh Academy, Fettes College, the Edinburgh High School, Merchiston College, and the five schools supported by the Merchant Company. There are four universities and a university college, with 285 professors and 6,382 students. The oldest of these universities, that of St. Andrews, was founded in 1411. Among schools for special purposes may be mentioned the theological colleges, seven training-colleges for teachers, an agricultural college, veterinary colleges, and a school of medicine for women. Many of these schools are at Edinburgh, which is likewise the seat of the Royal Society (founded 1783) and of the Royal Scottish Academy. See SCHOOLS AND COMMON SCHOOLS.

**Political Institutions.**—Scotland sends 72 members to the House of Commons, and 16 representative peers to the

House of Lords, who are elected for the duration of each Parliament (the Scottish peerage numbers 87 members, of whom 48 are also peers of the United Kingdom). At the time of the Union (1707) the Scottish Church and the judicial system were left intact, and Scottish law differs in many notable respects from that of England. The high court of justice includes a court of session for civil cases, and a high court of justiciary for criminal offenses. The inferior jurisdiction is exercised by sheriff courts, by borough magistrates and justices of the peace (bailies). The police force numbers 4,488 men. In 1893 2,394 persons were committed for trial, and 1,902 convicted.

Local government was reorganized in 1889 on the outlines followed in England. Elected county councils have taken the place of the old commissioners of supply and road trustees. Municipal bodies, presided over by a provost, exist in numerous cities and burghs. In 1888-90 (the last year for which there is a complete return) the local expenditure amounted to £7,341,893, inclusive of £886,543 for the relief of the poor, and £1,493,015 for the support of schools. Of the total amount required £4,590,788 was raised by rates, tolls, and dues, £964,525 was contributed by the imperial Government, and £1,410,398 was raised by loans.

**History.**—When Scotland first became known to the Romans its Highlands were occupied by Gaelic Picts, while the south was held by Cymric Britons. The Highlands were known to them as Caledonia (a corruption of Gael Dun, Land of the Gael). Julius Agricola (80-85) first penetrated this "Barbaria" as far as the Tay, and inflicted a defeat upon the Picts at Mons Graupius, but his conquests were only temporary, and when the Emperor Hadrian was in Britannia (122) he caused a wall to be built from the Solway to the Tyne as a protection of the Roman provinces against the predatory northern tribes. Twenty years afterward, in the reign of Antoninus Pius, the legate Q. Lollius Urbicus once more advanced into Caledonia, and constructed the Antonine wall between the Forth and Clyde. In 208, however, Severus once more retired to the Tyne, and although Flavius Theodosius, the father of Theodosius the Great, once more recovered the country between the two walls (369), and bestowed upon it the name of Valentia, in honor of the Emperor Valentinian I., the Romans finally retired from their conquests and abandoned Britannia.

The Picts again swept down over the lowlands and far into England, ravaging and devastating the country with savage but irresistible valor. The Britons now called the Anglo-Saxons to their aid, and the Picts were once more confined to their Highlands; in 449 a Saxon chieftain, Edwin, founded Edinburgh. In 503 the Scots—that is, the Celts from Ireland—crossed over to Britain and founded, under the leadership of Fergus, a Scottish kingdom along the western coast of Caledonia, from the Firth of Clyde to the present Ross-shire. The Celts of Ireland were Christians, having been converted by St. Patrick, and in 563 St. Columba went over from Ireland and settled among the heathen Picts, spending the rest of his life, till 597, in converting them to Christianity. In the beginning of the seventh century Scotland formed four independent kingdoms, namely, that of the Scots, along the west coast to the N. of the Clyde; that of the Picts, to the N. of the Forth; Strathclyde in the southwest, which was held by the Britons; and the Saxon domain of Bernicia. In 836 Kenneth, a lineal descendant of Fergus, became King of the Scots, and in 843 he also became King of the Picts, transferring his residence to Forteviot in Strathern, the old capital of the Picts. Thus the Scots and the Picts, two tribes of the Celtic race and speaking two dialects of the Celtic language, coalesced and formed one empire, which was originally known as Alban (Highlands), but developed in course of time into Scotia or Scotland, a designation by right belonging to Ireland. In 945 the King of England bestowed upon Malcolm I. (942-954) a portion of the Cambrian kingdom, and thus was established that claim for homage which subsequently led to many wars. In 970 King Edgar of England bestowed upon Kenneth III. the purely Saxon district of Lothian. The same king occupied also Strathclyde, and his successor, Malcolm II. (1003-33), acquired the Merse and Teviotdale from the Prince of Northumberland, thus extending Scotland to the Tweed.

While the Scottish kingdom was externally much extended, the Scottish people underwent an internal change by which the Celtic character almost disappeared. So many Teutonic elements were absorbed that in the course of two centuries a new national type was developed, in which the

about 1000, A.D. 1040 the House of Stuart succeeded the House of Godwin, and the history of Scotland from this time to the present is that of the union with England. It is given in the reigns of Robert II. and III., James I. VI., Mary Queen of Scots, &c. Most of the Kings of the Stuart dynasty were violent men, and many of them, but seven of them ascended the throne, and five ended their lives by a violent death. Their ambition gave the power of the nobility, and the great development, and for centuries the history of Scotland has been one long contest between the crown and the nobles, and one continual waste of funds between the crown and the nobles. In these troubles the Kings were supported by the Church; they flattered and one another. The Scotch Church was the richest in Christendom. In the sixteenth century it expended half of all its income in the country. But its members were the most ignorant of men in the past of Romanism, and they had to maintain their social position only by means of a few universities, which they spread around them. The nobles, some powerful and strong of the Church and some of the free country with great magnificence; and the great nobles of Scotland, history in the Scotch country was seen in the contest between Romanism and Protestantism in the sixteenth century, and the nobles and Protestants in the

The history of Scotland has been written by Burns (1805), Millar (1757), Cantelmo (1770-77), Drummond (1770), The House (1794-99), Burton (1807-79), Macdonald (1807), and Keith (1880). Works dealing with particular periods are Shaw's *Scottish Highland* (1870-80), Leslie's *The Early History of Scotland* (1880), Anderson's *Scotland in Queen Anne's* (1882-86), Prichard's, Taylor's, and Richardson's *Handbook*, R. Chambers's *Domestic Annals of Scotland* (1880-81), Macintosh's *History of Colonization in Scotland* (1878-86), and Rogers's *Scots Life in Scotland* (1884-86).

(continued to p. 10, 110610712)

**Scotland, Church of:** the established Church of Scotland, frequently since the Reformation called the Reformed Church of Scotland.

*Nearly Hebraic.*—There are traditions of the introduction of Christianity into Scotland in very early times, traditions in which figure such names as those of St. Andrew, St. Kintyre, and St. Ninian. About 560 a. d. St. Columbo founded his monastery on the lone Isle of Iona, and extended his missionary work all over Scotland, and even into England. His followers and successors are known as the Célias. In later centuries another stream of Christian influence was poured into Scotland from the South, representing the Roman form of ecclesiasticalism; and after the Scottish and Pictish monarchies were united in one king during the reign of Malcolm III., and largely through the influence of Margaret, his pious queen, many of the Célias yielded to the powerful influence of the Roman Church. Prior to this time, the middle of the twelfth century, till the dawn of the

Reformation, the history of the Church in Scotland is one of constantly increasing power and wealth, and of growing corruption. The parochial system of Scotland owes its establishment to this period, and the Scottish ecclesiastics maintained a brave and successful struggle for independence against the claims of the primacies of Canterbury and York, who successively sought to assume control over the Scottish bishops.

In the end of the fifteenth century half the wealth of Scotland had passed into the hands of the Church. The feudal power of the greater nobles was greatly weakened by this, and also by the rising up of a middle class of lesser landholders and burghers, who had become the most powerful party in Scotland in intelligence, industry, and resources. In the beginning of the sixteenth century the writings of the continental Protestant divines were introduced into Scotland, and the result was seen in the awakened intelligence and spiritual earnestness of this middle class. Patrick Hamilton, a youth of high mental endowments, returned from Wittenberg in 1527 and began to preach the Reformed doctrines. He was tried for heresy and burned at the stake (1528). Persecutions followed for thirty years, and then came the triumph of the Reformation in Scotland. See KNOX, JOHN; HENDERSON, ALEXANDER; and PRESBYTERIAN CHURCH.

*Distinctive Characteristics.*—The peculiar and essential features of the Reformed Church of Scotland, besides the profession of the evangelical faith common to all the churches of the Reformation, were—(1) The government of the Church by that order of men which is indicated in the New Testament by the terms presbyters and bishops or overseers; (2) the subjection of the Church in all things spiritual to Christ as her only Head, and to his word as her only rule.

*The First Covenant and Book of Discipline.*—In 1557 the First Covenant or Common Bond was signed. The subscribers to this document, after declaring their faith in "the Evangel of Christ," promise "before the majesty of God to maintain and defend the whole congregation of Christ, and every member thereof, to the death," and "to renounce and forsake all superstitions, abominations, and idolatries." The word *congregation* was then used as the distinctive name of all those who held to the doctrines of the Reformed Church, having the same signification as the work *kirk*, which was subsequently introduced, and the leaders of the Reformation in Scotland were known as "the Lords of the Congregation." The various congregations which belonged to the Congregation used the liturgy of Edward VI.; and the Apostles' Creed and King Edward's Catechism formed the articles of religion by which they were bound into a doctrinal unity. At the death of the regent, Mary of Guise, in 1560, the Parliament of Scotland met, and on Aug. 24 an act was passed which is described as "The Confession of Faith and Doctrines believed and professed by the Protestants of Scotland, and authorized by the Estates in Parliament." This confession was in fact "the Order of Geneva," including the confession of faith prepared for the English congregation at Geneva by John Knox. Immediately afterward, on Dec. 20, 1560, the first General Assembly of the Kirk of Scotland was held, and from this date the Assembly "took order for God's glory and the weal of his Kirk in the realm of Scotland." At this Assembly "the Book of Discipline of the Church was allowed and approved." This book was afterward submitted to the council, which refused to sanction it. Nevertheless, the Church proceeded at once to carry it into execution. The principles of religious liberty were not understood in that age, and the Scottish Reformers did not hesitate to enact laws which involved the infliction of civil penalties for offenses that were purely religious, though, to their credit, it should be stated that these penalties were seldom inflicted; but with these exceptions the great principles, both of faith and order, which were then agreed to, remain, amid all the changes of confessions, as those held by all the branches of the Reformed Church in Scotland to this day. It is especially worthy of note that in this "first Book of Discipline," while "the duty of nations and their rulers to own the truth of God and to advance the kingdom of his Son," is clearly stated, it is at the same time maintained that the Kirk possesses an independent and exclusive jurisdiction, "which flows directly from God and the Mediator, Jesus Christ, and is spiritual, not having a temporal head on earth, but only Christ, the only King and Governor of his Church." For seven years, from the death of the regent Mary of Guise (1560) till the

abdication of Mary Queen of Scots, the Kirk was without state endowment, and indeed without any recognition by the state of her jurisdiction.

*Patronage.*—At a very early period lay patronage was introduced into Scotland. Laymen who had endowed churches and monasteries reserved for themselves and their heirs the right of presenting incumbents to the benefices thus founded. At a later period these rights of presentation were to a large extent annexed to bishoprics, priories, abbacies, and other religious houses, so that at the time of the Reformation there were only 262 out of the 940 benefices the patronage of which remained in the hands of laymen. The rights of presentation which belonged to the religious houses were after the Reformation a continual subject of contention between the Assembly and the queen. In 1565 the General Assembly asked that the absolute right of the queen or of any lay patron to present a minister without examination be disallowed. To this the queen answered that it seemed to be "no way reasonable that she should defraud herself of so great a part of the patrimony of the crown as to put the patronage of benefices forth of her own hands." The patronage to these benefices continued to be held by the queen, or was by her distributed among her favorite nobles.

Immediately after the queen's abdication the Parliament met on Dec. 15, 1567, and passed an act in favor of the Reformed Kirk, ratifying the act of 1560 by which the Confession of Faith was sanctioned and adopted, and among other statutes one for the examination and admission of ministers by the Kirk, reserving the right of presentation to the lay patrons. This Parliament also "declared and granted the jurisdiction of the Kirk anent preaching of the true word of God, correction of manners, and administration of the holy sacraments." A similar act was passed in 1592, ratifying and enlarging the rights of the Kirk in regard to her jurisdiction over the appointment or deprivation of ministers. The acts of 1567 and 1592 have always been regarded as the solemn recognition and sanction by the nation of the constitution of the Reformed Church, and the great charters of her Presbyterian government and freedom from the supremacy of the crown in all causes spiritual and ecclesiastical.

*The Solemn League and Covenant and the Westminster Standards.*—In 1603 James ascended the English throne. After a long and bitter struggle, both in England and in Scotland, against the royal encroachments on the civil and religious liberties of the people, an ordinance of the English Lords and Commons in Parliament was passed on June 12, 1643, calling the Westminster Assembly. The General Assembly of the Kirk met in Edinburgh on Aug. 2 in the same year. Commissioners from England were present, and the result of their conferences was that on Aug. 17 "the Solemn League and Covenant" was passed unanimously by the General Assembly; it was then carried to the Convention of Estates and unanimously ratified by them. Commissioners were also appointed to represent the Kirk of Scotland in the Westminster Assembly. The Confession of Faith of the Westminster divines was finished in 1646, and on Aug. 4, 1647, it was adopted by the Scottish General Assembly, with two modifications; and two years later the Estates of Parliament ratified this decision.

*Later History.*—Charles II. was restored to the throne in 1660, and an attempt was then made to conform the Scottish Church to that of England by the establishment of the episcopal form of government. So severe was the persecution that even to be present at a field conventicle was punishable by death and confiscation of goods. Yet the great body of the Scottish people steadfastly resisted. In the year 1688 William of Orange became king. In Apr., 1689, the Scottish Parliament met and passed an act abolishing prelacy. In 1690 the Parliament passed acts rescinding the statute of 1669, which had declared the king's supremacy, and ratifying the Confession of Faith and settling Presbyterian church government. The same Parliament passed an act abolishing lay patronage, though the new monarch was known to be strenuously opposed to its abolition. In 1693 the Parliament passed an act for "settling the quiet and peace of the Church," but this act expressly provided for summoning the General Assembly by royal authority. The General Assembly met in May, 1694. The king instructed the royal commissioner that if the act of supremacy was not accepted he should at once dissolve the Assembly, but at last the threat of dissolution was withdrawn, and the independence of the Kirk was again confirmed.

*Daughter Churches.*—In the articles on the FREE CHURCH OF SCOTLAND and PRESBYTERIAN CHURCH (qq. v.) will be found

net, and Anne Rutherford, daughter of Dr. John Rutherford, Professor of Medicine in the University of Edinburgh. He was lineally descended from the ancient chieftain Walter Scott, traditionally known as Auld Walt of Harden. He was a strong and healthy child until about eighteen months old, when he became incurably lame in his right leg—a weakness which sadly interfered with his love of active sports, but never marred his cheerfulness, good temper, or courage. His early childhood was passed in the farmhouse of Sandy-Knowe. At the age of eight he was placed in the High School of Edinburgh, where he remained for four years, the first two in the class of Luke Fraser, and the remaining time under the tuition of the distinguished rector, Dr. Alexander Adam, of whom Scott gives a pleasant account in his fragment of *Autobiography*. Personally popular, and making himself respected by his courage and general ability to take care of himself, he was not regarded as a very bright scholar, although even then giving evidence of his love of knowledge, of a strong memory for whatever pleased him, and of special delight in history, poetry, fairy tales, and romances. In 1788 he entered the university, and for a year or more attended the classes in Greek, Latin, logic, and ethics, giving some attention also to history and law. In the ancient languages he made but little progress, although more successful in other studies. It is not surprising, then, that in thorough knowledge and discipline he should have found himself at fault. Years afterward, and when he had become famous, he writes in his *Autobiography*: "It is with the deepest regret that I recollect in my manhood the opportunities which I neglected in my youth. Through every part of my literary career I have felt pinched and hampered by my own ignorance; and I would at this moment give half the reputation I have had the good fortune to acquire if by doing so I could rest the remaining part upon a sound foundation of learning and science." His progress in the university was arrested by a severe attack of illness, which seems to have broken up all plans of further study, and in 1785–86 he entered into indentures with his father to serve the usual apprenticeship to a writer to the signet. In 1792 he was called to the bar. During these and the succeeding years he was crowding his mind with vast accumulations of "ponderous and miscellaneous" knowledge of poetry and archaeology, fiction, and history, not easy to condense or reduce to system and order. "My memory of events," he says, "was like one of the large old-fashioned stone cannons of the Turks, very difficult to load well and discharge, but making a powerful effect when by good chance any object did come within range of its shot." He had already begun to collect books and articles of antiquarian interest, "the germ of the magnificent library and museum of Abbotsford." His mind was already turning toward letters, and in 1796 he made his first considerable publication, being translations from the German of Bürger. This was followed in 1799 by a translation of Goethe's *Goetz von Berlichingen*. *The House of Aspen*, which was not published till 1829, and several ballads.

In the meantime, in Dec., 1797, after a serious disappointment in love, he was married to Charlotte Margaret Carpenter, or Charpentier, a young lady of French birth and parentage, but a resident in England. Two years later, through the influence of his friends, he obtained the appointment of sheriff-depute of Selkirkshire, an office with light duties, which brought the important addition to his resources of £300 a year. In Jan., 1802, he published two volumes of the *Minstrelsy of the Scottish Border*, which was completed the next year by a third volume. It was received with great favor, and may be considered as opening the way to his general fame. It brought him also into familiar acquaintance with men of genius and lovers of legendary lore, such as Richard Heber, long member of Parliament for the University of Oxford, and that eccentric genius John Leyden.

From this time onward to the year 1831, when, at the age of sixty, he gave to the world the fourth series of *Tales of my Landlord*, there was but one year (1807) which was not marked by some independent work in verse or prose, bearing the impress of his genius, giving new impulse to literature and new fame to the land of his birth. There is room to mention only the most important of these. In 1805 the *Lay of the Last Minstrel* was published. It took the world by surprise, and was received with unbounded delight, not only for its chivalric spirit, its "vivid richness of coloring," its pathos, beauty, grace, and airy freshness, but as giving the promise of original poetic fervor and power to which the kingdom had long been a stranger. Edition after edi-

tion was called for, and sold as soon as published. "In the history of British poetry," says Lockhart, "nothing had ever equalled the demand for the *Lay of the Last Minstrel*." This was followed in 1808 by *Marmion*, perhaps the strongest and boldest of his poems, and in 1810 by *The Lady of the Lake*, in some respects more pleasing than any. In these his poetic power culminated. The poems subsequently published—*The Vision of Don Roderick* (1811), *Rokeby* (1812), *The Bruce of Triermain* (1813), *The Lord of the Isles* (1815)—were unequal to the earlier, and in various ways gave evidence of a waning popularity, which Scott was among the first to recognize. Another reason for this perceptible loss of popular favor was the appearance of another brilliant light in the early poetry of Lord Byron.

During these six or eight years Scott had been advancing in fame and in pecuniary resources. In 1804 he took the house of Ashiestiel, in the Ettrick Forest, overlooking the Tweed. In 1806 his friends had procured for him the appointment to one of the clerkships of the court of sessions, worth about £1,800 a year, the emoluments of which, however, by an express arrangement, he did not receive until the death of his predecessor in 1812. Still earlier, in 1805, he had become a regular partner in the printing-house of James Ballantyne & Co., although this connection was kept a profound secret from nearly every one of his most intimate friends. This was undoubtedly one of the most important steps of his life. "He continued bound by it," says his son-in-law, "during twenty years, and its influence on his literary exertions and his worldly fortunes was productive of much good, and not a little evil." In 1806 he took a prominent part in establishing *The Quarterly Review* in London, in opposition, politically, to *The Edinburgh Review*, the acknowledged advocate of the Whigs. In 1811 he purchased Abbotsford, a property of 100 acres of land on the banks of the Tweed, near Melrose, for £4,000. To this he added estate after estate adjoining, purchasing at high rates, till he had expended nearly or quite £40,000, to which must be added £25,000 more for preparing the grounds and erecting the mansion where for a few years he dispensed a splendid hospitality, and to which his fame drew visitors from every part of the civilized world.

In 1813, on the death of Pye, he was offered the office of poet-laureate, which he refused; but in Mar., 1820, he accepted a baronetcy, and in November of the same year the presidency of the Royal Society of Edinburgh. His exertions, two years later, during the visit of George IV. to Edinburgh, seem to have tended, in company with overwork, to undermine his health.

On the decline of his popularity as a poet his fertile mind turned to another form of literature, with which for ten or twelve years he surprised and enchanted the world. In 1814 appeared, anonymously, a novel under the title of *Waverley*. The next year *Guy Mannering* was published; in 1816, *The Antiquary* and the first series of the *Tales of My Landlord*; in 1817, *Rob Roy*; in 1818, *The Heart of Midlothian* (second series of *Tales of My Landlord*); in 1819, *Tales of My Landlord* (third series) and *Ivanhoe*. This splendid series of novels, thrown off with an ease and rapidity without parallel, marks the high tide of his genius. Those which follow are on a somewhat lower level, but the abundance of the production was hardly diminished. *The Monastery* and *The Abbot* followed in 1820; *Kenilworth* and *The Pirate* in 1821; *The Fortunes of Nigel* in 1822; *Peveril of the Peak*, *Quentin Durward*, and *St. Ronan's Well* in 1823; *Redgauntlet* in 1824; *The Tales of the Crusaders* in 1825; and *Woodstock*, written in the midst of impending troubles, in 1826. *The Chronicles of the Canongate* (first and second series) followed in 1827 and 1828, *Anne of Geierstein* and *The Tales of My Landlord* (fourth series) in 1829 and 1831 close the long list.

The secret of the author of *Waverley*, although known to some and confidently conjectured by almost every one, was not acknowledged until after the bankruptcy of Constable and the Ballantynes had rendered even a formal concealment no longer possible. Early in 1826 Constable was obliged to stop payment, and the Ballantynes, including Scott as partner in the house, being closely connected, faced for a very large amount. The humiliation to Scott was indescribable, but he met the trial with remarkable strength and dignity. The most liberal offers of assistance were made to him by friends and admirers, among them one of £30,000 from an anonymous correspondent, but he firmly declined them all. He refused to take any advantage of circumstances which might have freed him from the claims

Ireland, and the same cause perhaps has something to do with the very common pronunciation of *r* in cases where in Southern England and some regions in the U. S. that sound has been lost (though the Scotch *r* is not like the sound heard in the U. S.), as well as with the fact that in the U. S. speakers rarely drop or misplace the sound of *h* in standard English, and more generally distinguish *wh* from *w* than is the case in England. But it is not necessary to assume that Scotch pronunciation is the only or even the chief cause of these and some other features of American pronunciation. See, further, Jamieson's *Etymological Dictionary of the Scottish Language* (revised ed. 4 vols., 1879-82); J. A. H. Murray, *The Dialect of the Southern Counties of Scotland in Transactions of the (London) Philological Society* (1870-72, part ii.); A. J. Ellis, *Early English Pronunciation* (part v., 1889), etc.

S. S. HALDEMAN.  
Revised by E. S. SHELDON.

**Scottish Language:** the language spoken in Scotland. This is well known to be not a Celtic dialect, but a form of English which differs from the standard speech by reason of a separate development, and because of external influences to which the latter has not been subjected in the same degree. English became the language of Scotland owing to political events in the early history of the country. The Northumbrian kingdom in the seventh century included the Lowlands of Scotland in its supremacy. As a result, English, the language of Northumbria, began to spread more widely over the Lowlands. When the Scottish kingdom became separated from England, the struggles for supremacy between the Saxons of the Lowlands and the Celts of the Highlands resulted in a victory for the former, and English became after a time the recognized literary language.

The form of English thus adopted was that called Northern English, spoken from the Humber northward. Up to the middle of the fifteenth century Scotch-English did not differ from that used in Yorkshire and Northumberland. From about this time, however, owing to the development of a separate national life and literature, that form of Northern English spoken in the capital city, Edinburgh, became the standard literary language of Scotland. The literature produced in this language includes such important names as Barbour, James I. (of Scotland), Wyntoun, Henryson, Dunbar, and Douglas.

The various external influences affecting Scotch-English differ considerably in degree from those affecting the language of England. Celtic, which remained as a linguistic sub-stratum in the Lowlands and as the dominant speech of the Highlands for many years, influenced the English of Scotland more than that of any other part of Britain. Thus many Celtic words, not found in English, belong to Scotch. The Norse or Scandinavian influence was probably as great as upon Northern English as a whole, and thus greater than upon Southern or Midland English. The French influence was due not so much to the Norman conquest as to those close political relations between Scotland and France which enabled the former to retain her independence for so many years. The revival of classical learning powerfully affected Scotland, as it did the rest of Britain, but the earlier classical influence was probably not so great upon the language of the north as upon the language of the south. More powerful than all other influences has been the effect upon the Scottish language of the standard language of England. Its earliest marked effect was at the time of the Reformation, and this was greatly increased by the union of the two countries under the same king in 1603. In fact, since that time, except for a partial revival of the popular speech in the poems of Ramsey, Fergusson, and Burns, the Scottish language has gradually given place to the literary language of England. Even the speaking of Scotch-English, as distinct from the English of the south, has more and more been given up by educated people, so that this form of the language, so long dominant in the northern kingdom, has been gradually sinking to the position of a mere dialect, without a literature or a considerable body of cultivated speakers.

A systematic treatment of the subject may be found in *The Dialect of the Southern Counties of Scotland*, by James A. H. Murray, in *Transactions of the (London) Philological Society* (1870-72). See ENGLISH LANGUAGE.

**Scouller, JAMES BROWN, D. D.:** clergyman; b. near Newville, Pa., July 12, 1820; educated at Dickinson College and the United Presbyterian Theological Seminary, Allegheny, Pa.; pastor of the United Presbyterian churches, Fourth of Philadelphia 1844-47, Cuylerville, N. Y., 1847-52, Argyle, N. Y., 1852-62; editor, 1862-63, of *The Christian Instructor*, for which he had written *Forty Letters from Abroad, principally Italy and Egypt* (1860-61). Dr. Scouller's principal published works are *A Manual of the United Presbyterian Church* (1881; 2d ed. 1887); *Calvinism: its History and Influence* (1885); and *History of the United Presbyterian Church*, in American Church History Series (New York, 1894).

C. K. HOYT.

**Scovel, SYLVESTER FITHIAN:** clergyman and educator; b. at Harrison, O., Dec. 29, 1835; educated at Hanover College, Indiana, and New Albany (now McCormick) Theological Seminary; pastor of Presbyterian church, Jeffersonville, Ind., 1852-61, First Presbyterian church, Springfield, O., 1861-66, First Presbyterian, Pittsburgh, Pa., 1866-83; and since 1883 has been president of Wooster University, Ohio. He has published sermons, addresses, and *Centennial Volume of the First Presbyterian Church of Pittsburgh* (Pittsburg, 1884).

C. K. HOYT.

**Scranton:** town; capital of Jackson co., Miss.; on the Pascagoula river and the Louisville and Nashville Railroad; half a mile N. of the Gulf of Mexico, 45 miles S. W. of Mobile, Ala. (for location, see map of Mississippi, ref. 9-II). It saws and ships large quantities of pine lumber, has an extensive oyster industry, and contains a State bank with a capital of \$25,000, and two weekly newspapers. Pop. (1880) 1,052; (1890) 1,353.

**Scranton:** city; capital of Lackawanna co., Pa.; on the Lackawanna river, and the Cent. of N. J., the Del. and Hud., the Del., Lack. and W., and the N. Y., Ont. and W. railways; 18 miles N. E. of Wilkesbarre and 107 miles N. of Philadelphia (for location, see map of Pennsylvania, ref. 3-I). It is the fourth city in the State in population and the center of the great anthracite coal region, and has a picturesque location in the Lackawanna valley on a plateau at the confluence of Roaring brook and the Lackawanna river. The city is laid out with wide straight streets; has several public parks and squares, and a beautiful drive to Elmhurst; and contains 140 miles of streets, many paved with asphalt and brick, improved water-works, gas and electric light plants, and electric street-railways. The area is 19½ sq. miles. Among the notable public buildings are the U. S. Government building, court-house, municipal building, Albright Memorial Library, Moses Taylor Hospital, and the Oral School for the deaf and dumb.

**Finances and Banking.**—The assessed valuation of real and personal property in 1894 was \$19,291,124, and the net debt Jan. 1, 1895, was \$438,232. In 1895 there were 3 national banks with combined capital of \$650,000, 4 State banks with capital of \$500,000, a trust and safe deposit company with capital of \$250,000, and an unclassified bank with capital of \$30,000. Scranton has 15 building and loan associations, all local and all but two on the terminating plan, with an aggregate of 4,851 shareholders, 1,708 borrowers, and 25,746½ shares in force.

**Churches, Schools, etc.**—Scranton is the seat of a Roman Catholic bishopric and has 70 churches of various denominations. There are 37 public-school buildings, public-school property valued at over \$900,000, 4 colleges, a nunnery, 6 public libraries, 2 hospitals, and 4 daily, 17 weekly, and 6 monthly periodicals.

**Business Interests.**—The census returns of 1890 showed 138 manufacturing establishments (representing 41 industries), with a combined capital of \$25,144,936, employing 8,498 persons, paying \$3,921,831 for wages and \$15,968,446 for materials, with products valued at \$22,801,028. The principal industry is the manufacture of iron and steel, 4 establishments, with \$8,840,706 capital, employing 3,298 persons, paying \$1,726,229 for wages and \$10,716,206 for materials, with products valued at \$13,278,299. Then follow the manufacture of malt liquor, 3 establishments, \$471,700 capital; silk and silk goods, 3 establishments, \$440,690 capital; planed lumber, 8 establishments, \$429,536 capital; flour and feed, 5 establishments; carriages and wagons, 9. The city is an important center for general trade and one of the principal distributing-points for the anthracite coal trade.

**History.**—The city was founded by Joseph H. and George

graduated at Cambridge, 1835; was for many years master of classical schools, especially that at Falmouth, where he was also incumbent of a church 1846-61; became rector of St. Gerrans, Cornwall, 1861; vicar of Hendon and a prebendary of Exeter 1876. D. at Hendon, Oct. 26, 1891. He holds a high rank in the philological criticism of the New Testament; published valuable editions of the *Greek Testament* of Stephens (1860; 7th ed. 1877) and of the *Codex Bezae* (1864); a *Full Collation of the Codex Sinaiticus with the Received Text of the New Testament* (1863); and the *Cambridge Paragraph Bible, with the Text Revised and a Critical Introduction* (1873); *Greek Testament, with the Changes of the New Testament Revisers* (1881); wrote a *Plain Introduction to the Criticism of the New Testament* (1861; 4th ed. by E. Miller, revised and enlarged, 1894, 2 vols.), and other works of kindred character; was appointed one of the company of revision of the authorized version of the New Testament 1870, and was granted a pension from the civil list 1872, "in recognition of his services in connection with biblical criticism."

**Scrivener's Cramp:** See NEUROSIS.

**Scrofula**, or **Struma** [*scrofula* is from Lat. *scrofula*, scrofulous swellings, *scrofula*, plur. of *\*scrofula*, liter., dimin. of *scrofa*, sow, swine being affected by a similar disease; *struma* is from Lat. *struere*, to build, since the lymphatic glands are enlarged in this condition]: a constitutional disease characterized mainly by defective nutrition of the tissues. Persons of the lymphatic temperament are most liable to develop the marked symptoms of struma or scrofula. Scrofula is hereditary in many families. In other persons it may arise *de novo* from bad hygiene and regimen, especially in children when rapidly developing. Most cases formerly considered scrofulous are now regarded as tuberculous, directly caused by the presence of the *Bacillus tuberculosis*. Many symptoms, too, of disordered blood-states formerly grouped as scrofulous are now distinguished as having definite causes. Eczema, though often an exponent of struma, is as often due to other causes—nervous influences, gouty or rheumatic taint, gastric and intestinal derangements. The scrofulous person is often light-complexioned, the skin white, the body full, or even obese, but the muscles soft and flabby. In other individuals, of what is called the dark strumous type, there may be delicately formed features, clear complexion, and much personal beauty. The chief characteristic of scrofula is the susceptibility of the lymphatic glands and of the bones and joints to grave forms of disease from slight exciting causes. It must not be confused with rachitis, or rickets, with which it has no necessary connection, nor with inherited syphilis. Either persistently or with every slight impairment of health the glands of the neck, groin, abdomen, etc., may become indurated and enlarged. Such swellings may be evanescent or leave permanent indurations. The glands of the neck frequently are so engorged with scrofulous exudative matter that it undergoes cheesy or caseous degeneration—or actually suppurates, producing scrofulous abscess. Scrofula is not, then, a definite specific disease, but a condition of serious perversions of the nutritive qualities of the blood, and resulting affections of the various tissues and organs of the body. Enlarged glands, moist skin diseases, superficial abscesses, and destructive inflammations of the bones and joints are some of its manifestations. Inherited scrofulous taint may remain latent until developed by depressing sickness. Thus measles, a harmless disorder in robust children, is hazardous when struma lurks in the system. The bottle-fed infant and the foundling are more often scrofulous than the nursed, home-reared child. The mucous surfaces are very liable to disease in struma, chronic bronchial catarrh, diarrhoea, and cholera infantum. The relation of scrofula and tuberculosis is disputed. Modern pathologists believe that the bacillus of tubercle is the efficient cause of most of the conditions formerly attributed to struma, the micro-organism lying dormant in the body until from some accidental source of depression a suitable nidus is formed for its development and multiplication; but there are some cases in which neither tubercle nor syphilis can be demonstrated, and for these the term struma may still properly be retained. The treatment of scrofula is hygienic and nutritive—warm clothing, bathing, friction to the skin, pure air, nutritious diet, special articles such as cod-liver oil, and preparations of malt and of phosphates. Iron, iodine, and arsenical preparations act as alteratives to reduce glandular enlargements.

**Scrophularia'cea:** See FIGWORTS.

**Scruple** [from Lat. *scrupulus* (dimin. of *scrupus*, a rough, sharp stone), pebble, (as a weight) a scruple]: in apothecaries' weight, one-third of a drachm, 20 grains, the  $\frac{1}{48}$ th part of the pound troy. The Romans gave the name to the  $\frac{1}{48}$ th part of any standard unit of measure.

**Scudder, HENRY MARTYN, M. D., D. D.:** clergyman and missionary; son of Rev. John Scudder; b. at Panditerra district of Jaffna, Ceylon, Feb. 5, 1822; went to the U. S. in 1832; graduated at University of City of New York in 1840, and at Union Theological Seminary in 1843; was ordained a Presbyterian clergyman same year, and sailed for Madras as a missionary of the American Board of Commissioners for Foreign Missions. In addition to his missionary work he studied medicine in the medical college of Madras, graduated, opened a hospital and dispensary for gratuitous treatment of the poor, and received an honorary M. D. from New York College of Physicians and Surgeons in 1853. He was in Madras from 1844 to 1851, and in the Arcot Mission from 1851 to 1863; returned to the U. S. in 1864; was pastor of a Reformed Dutch church in Jersey City 1865-71; was a Presbyterian pastor in San Francisco; was pastor of the Central Congregational church, in Brooklyn, N. Y., 1871-Nov., 1882; pastor of Plymouth Congregational church, Chicago, Ill., 1883-87. His publications include several works in the Tamil language. He went to Japan in 1887 to engage in missionary work.

**Scudder, HORACE ELISHA:** author; b. in Boston, Mass., Oct. 16, 1838; graduated at Williams College 1858; taught in New York till 1861, when he removed to Boston and devoted himself to literary work. He was editor of *The Riverside Magazine* (Cambridge, 1867-71), and became a resident of Cambridge, Mass., 1875. In 1890 he became editor of *The Atlantic Monthly*. He is the author of *Seven Little People and their Friends* (1862); *Dream Children* (1863); *Stories from my Attic* (1869); *The Bodley Books* (1875-87); *The Dwellers in Five-Sisters Court* (1876); *Stories and Romances* (1880); *Life of Noah Webster* (1882); *History of the United States* (1884); *Men and Letters* (1888); etc.

Revised by H. A. BEERS.

**Scudder, JOHN, D. D., M. D.:** missionary; b. at Freehold, N. J., Sept. 3, 1793; graduated at Princeton 1811; M. D. College of Physicians and Surgeons, New York, 1815; became a physician in New York, where he was house-surgeon to the City Hospital; abandoned an extensive practice to devote himself to missionary work; was a missionary physician of the A. B. C. F. M. in Ceylon 1820-36, after which he was transferred to the Madras mission; spent several years (1842-46) in the U. S., visited the Cape of Good Hope for his health 1854, and died of apoplexy at Wynberg, South Africa, Jan. 13, 1855. Author of several publications on missionary subjects. His labors in the establishment of hospitals and schools in Ceylon and Southern India were very successful. He takes rank with the best of the early missionaries in India. His ten children—eight sons and two daughters—all became missionaries in India; most of them are also physicians. See his *Memoir*, by Rev. J. R. Waterbury (New York, 1856).

**Scudder, SAMUEL HUBBARD:** naturalist; b. in Boston, Mass., Apr. 13, 1837; graduated at Williams College 1857, and at Lawrence Scientific School of Harvard 1862. He has been a prominent member of the Boston Society of Natural History, holding almost every office, including that of president (1880-87). He was assistant librarian of Harvard College 1879-82; paleontologist of the U. S. geological survey 1886-92; member National Academy of Science since 1877. His publications, which number upward of 620, are mainly upon insects, especially butterflies, Orthoptera, and fossil insects. Among the more important of his works may be enumerated: *Catalogue of N. A. Orthoptera* (1867); *A Century of Orthoptera* (1868-79); *Catalogue of Scientific Series* (1879); *Butterflies: their Structures, Changes, and Life-histories* (1881); *Nomenclator Zoologicus* (1882); *Butterflies of the Eastern United States* (1888-89); *Tertiary Insects of North America* (1890); *Life of a Butterfly* (1893); *Guide to the Common Butterflies* (1893). He was also one of the founders of *Science*, and its editor 1883-85.

J. S. KINGSLEY.

**Scudéry, skū'dā'ree', MADELEINE, de:** poet and novelist; b. at Havre, France, June 15, 1607; was educated in Paris; became one of the most conspicuous figures in the literary circle of the Hôtel Rambouillet, and acquired great celebrity

mental development than rude sculpture. It is not meant that sculpture always precedes drawing; probably the reverse is the case, because the temptation to scratch or otherwise mark on a flat surface, and in doing so to represent a beast or a man, must always have been present. Sculpture may not always precede drawing, but will always be found more nearly truthful to nature than the drawing of the same epoch. The sculptor having form only to consider is concerned at first with two things: The first, to produce an ornamental object, or else to ornament parts of a useful thing, as a paddle or the prow of a canoe; the second, to represent something that he takes an interest in. Another idea often mingles with these two—namely, the production of an object, like an idol or fetish, in which he can embody some notion of worship or which he can use to terrify an enemy. This last motive speedily disappears or becomes of little moment as the skill of the sculptor increases. As he becomes able to deal with form somewhat easily and with results partly satisfying to himself, he finds a pleasure so intense in the production of his work of art and also in the suggestions from nature which he is enabled to embody in it that he forgets all other considerations. Thus in an Assyrian sculptured slab covered with figures in low-relief representing a battle, the triumphal entry of a king, or the same king hunting a lion, it is evident that the sculptor's chief care is for the beauty of his work. His slab was one of many which were to form the dado of a long and narrow gallery; the persons who were to see his bas-relief would never be far away from it, and it was for a point of view 10 or 15 feet away, and for light coming from high in the wall, that he had to plan his work. Therefore his figures were small, or, when large, filled with small details; his relief was kept low, and the outline when the relief quits the background was especially cared for. Under these conditions he labored to produce the most beautiful or striking combinations of lines and masses possible to him; but in doing this he made reference constantly to nature, and indeed found in the study of nature his chief suggestions of beauty and of strength, ferocity, swift and vigorous action, and other things agreeable to look upon. Thus nothing he could imagine would be as fine, let us suppose, as a lion in free action walking or springing; to this beautiful thing he could add human interest by showing the lion struggling with the hunters; and if in so doing he was able to flatter the king who employed him by representing his majesty twice as tall as his attendants and easily victorious over lions by the score, this in no way interfered with his artistic design or its impressiveness. It is true, of course, that religious or patriotic impulses act upon the sculptor as upon other men. Such impulses, however, do not seriously modify the sculptor's work, except in so far as they stimulate the whole man, excite his enthusiasm, raise him above himself as the phrase is, and in doing this they may improve his work or ruin it as man's nature and his surroundings may decree. Thus in the famous group by François Rude on the eastern face of the Arc de l'Etoile and representing the departure for the war of patriotic volunteers, there is no question that Rude was strongly in sympathy with the subject chosen and the enthusiastic love of country which suggested it. As a sculptor, however, he was concerned chiefly with the beauty and vigor of his composition and the harmonizing of the numerous and varied masses which make it up, and at the same time with the full expression of the different figures, here of youthful agility, there of manly strength in its maturity, and in the crowning figure of womanly forms carried to superhuman massiveness and force. Patriotism and hostility to the foes of France must have acted upon Rude as a powerful stimulus throughout his life, but it is only in this indirect way that those passions can be said to have dictated the design for *Le Départ*.

*History.*—The earliest sculpture of which the date can be fixed approximately is that of the Egyptian buildings of the early dynasties, and the few statues of the same epoch which have been discovered. These are dated by different authorities at from 4500 to 3500 B. C. The merit of these, both artistically and in the representation of natural forms and expression of face, is very great, so that we find Egyptian fine art already in an advanced stage of development at that early age. The sculptures from Mesopotamia of a date almost as remote are indeed far inferior in merit to the Egyptian, but are still those of an advanced civilization. There is no doubt that further investigations in the region about the Euphrates will reveal a continuous series of civilizations, vying with one another in their fine arts as in other respects. That of which we know the most is the Assyrian sculpture.

(See ASSYRIAN ART.) There was also sculpture produced among the mountainous states of Asia Minor which has been studied with some success since about 1880; this is of peculiar importance because of the influence of its later productions over the early art of Greece. (For the more developed art of Greece, see GRECIAN ARCHITECTURE; also ARCHITECTURE, CHRYSOEPHANTINE STATUES, and PARTHENON.) The dates of Greek sculpture are nearly as follows: During the years from 600 to 480 B. C. the earliest works which can properly be called Grecian were produced, such as the metopes of Selinus now in the Museum of Palermo, the *Apollo of Tenea* at Munich, the *Apollo of Thera* at Athens, the seated figures from Branchidæ (Miletus) in the British Museum, the frieze of the Temple of Assos partly in the Louvre, and the pediment sculptures of the Temple of Ægina, now in Munich. These are arranged here in the order of their increasing refinement. The two fine statues at Naples called *Harmodius* and *Aristogiton* are thought to be copies or duplicates of statues put up in Athens about 500 B. C. The remarkable statues found in Athens on the Acropolis in 1883 and 1886, and distinguished by their well-preserved painting, may be of the years from 500 to the Persian invasion in 480. The Persian war following this year and lasting till 477 may probably have checked the growth of fine art in Greece, while preparing for a rapid and splendid development with peace. When Athens became the chief city in Greece and the head of a confederation of states, the epoch of her greatest and noblest fine art was soon to begin. The years from 460 to 430 B. C. are marked by the sculptures of the Temple of Zeus at Olympia, of the Parthenon at Athens, of the Temple at Bassæ (Phigaleia), of the Temple of Athena Nike on the Acropolis, and in part of the Erechtheum. The chief sculptors of the best time of Grecian art, with the dates of their highest achievement approximately given, are Phidias, 440; Myron, 440; Cresilas, 440; Polyclitus, 430; Scopas, 420; Cephisodotus, 370; Praxiteles, 360. From that time until the third century A. D. the history of Greek sculpture is mainly that of an art serving states or powers not Greek, the merit and importance of the work done varies very greatly, according to the opportunity offered by the new masters of the Mediterranean world, such as the Kings of Pergamum, then Alexander the Great and his successors, and finally the Roman dominion. A great deal of noble sculpture was produced in every brief epoch, if not in every year, down to the death of Marcus Aurelius in 180 A. D. See ROMAN ARCHÆOLOGY.

It must be remembered that sculpture was commonly painted in bright and varied colors among all the peoples of antiquity. Egyptians, Assyrians, Greeks, and the people of the Græco-Roman empire all agreed in this. See POLYCHROMY.

During the Middle Ages sculpture had less purely sculptural character than generally in classical antiquity—that is to say, the artists had less sense of the beauty and expressiveness of pure form, as in the human body. They knew much less about the body, partly because of the custom of wearing very full and ample clothing, and no longer bathing and exercising in public as the ancients had done; religion, moreover, taught the unworthiness of the flesh as nothing in Greek or Roman life had asserted it. On the other hand, the decorative and building instinct was very strong throughout the Middle Ages. The Byzantine artists had no sculpture beyond that of capitals and similar architectural members and rude bas-reliefs of sacred subject; their decoration was chiefly in color on flat surfaces. The Western nations in the years following the establishment of comparatively peaceful communities showed a strong taste for figure-sculpture as used in the decoration of architecture. This was rude enough in the eleventh century, but grew rapidly in refinement. The statues in the porches and the "royal galleries" in such cathedrals as Chartres in the twelfth century, Bourges, Paris, and Chartres again in the thirteenth century, are the highest development known to us of sculpture, whose chief aim is decoration, the climax of excellence being reached in the porches of Rheims cathedral (1250, and the following years). This art was pursued with almost equal success in England, Spain, and parts of Germany. In Italy the mediæval sculpture is abundant and beautiful; it keeps something of the ancient grace and also some of the ancient knowledge of the human form. For the development of sculpture in Italy at the close of the Middle Ages, see RENAISSANCE, MICHELANGELO, and the names of other sculptors of the epoch. In France and the north generally sculpture passed from the style of the Middle Ages

ber, metals, drugs, paper, and earthenware; exports (in value only one-third of the imports) raw stuffs, dyewoods, and rags. Pop. 36,000, of whom 27,500 are Mussulmans.

E. A. GROSVENOR.

**Scutching:** See FLAX.

**Scutibranchia'ta** [Mod. Lat.; Lat. *scu'tum*, shield + *bran'chia*, gills]: an obsolete term for those molluscs now included under the *Zygobranchia*. See GASTEROPODA.

**Scyllite:** See PERIDOTITE.

**Scylax**, s'il'aks (Gr. *Σκύλαξ*): Greek geographer of Caryanda in Caria, who, by command of Darius I., made a voyage of discovery from the Indus through the Indian Ocean to the Red Sea (Herodotus, iv., 44). The *Periplus*, which bears the name of Scylax and describes a voyage along the coast of Europe, Asia, and Africa, is a much later performance, and has been assigned to the middle of the fourth century B. C. It was edited by Müller (*Geographi Græci Minores*, vol. i., pp. 15-96). See Bunbury, *History of Ancient Geography* (vol. i., p. 384, seq.). B. L. G.

**Scylla**, or **Scilla**, s'il'la (Gr. *τὸ Σκύλλαιον ἄκρον*; Ital. *Scoglio*): a high and steep promontory on the Italian side of the Strait of Messina. In ancient mythology it was the home of the sea-monster Scylla, who, along with the whirlpool Charybdis, threatened destruction to all mariners.

J. R. S. S.

**Scyll'idæ** [Mod. Lat., named from *Scyllium*, the typical genus, in form dimin. of Gr. *Σκύλα*, Scylla; cf. *σκόλιον*, dog-fish, and *σκόλλειν*, rend, tear]: a family of sharks distinguished by the position of their dorsal fins and their habit of laying eggs like those of the rays. It includes the dog-fishes. The body is more elongated than is the case with the sharks generally. The *Scyllidæ* are inhabitants entirely of the seas of the Old World and Australia. They are among the few sharks which lay eggs invested in parchment-like cases, like those of the rays. Revised by F. A. LUCAS.

**Scym'nidæ** [Mod. Lat., named from *Scymnus*, the typical genus, from Gr. *σκόμνος*, cub, whelp]: a family of sharks distinguished by the absence of the anal fins and presence of unarmed dorsals. It includes the Greenland sharks.

Revised by F. A. LUCAS.

**Scymnus**, sim'nūs (Gr. *Σκύμνος*): Greek geographer, to whom has been attributed an outline of the geography of the ancient world composed in iambic trimeters. The authorship of this *περὶ ἡγεσης*, as it is called, is doubtful, as the original Scymnus wrote in prose, and the time is uncertain, the first or second century B. C. It was edited by Müller (*Geographi Græci Minores*, vol. i., pp. 196-237). See Bunbury, *History of Ancient Geography* (vol. ii., 71). B. L. G.

**Scyphomedusæ** [Gr. *σκόφος*, cup + *Medusa*, a fabled monster]: a group of cœlenterates belonging to the class SCYPHOZOA (q. v.).

**Scyphoph'ori** [Mod. Lat.; Gr. *σκόφος*, cup + *φέρειν*, bear]: an order of fishes established by Prof. Cope, and distinguished by the following characters: The skeleton is completely ossified; the basis cranii simple; the parietals narrow, and distinct from each other as well as the supraoccipital; the pterygoid is very peculiar, being enlarged and funnel-shaped, and excavated by a bowl-like chamber (whence the name), which expands laterally and is covered by a lid-like bone; no symplectic exists; the jaws are well developed, but the intermaxillaries coalesce, at least in the old, into a single bone, and the maxillaries are lateral; opercular apparatus complete, but with the interoperculum and suboperculum reduced in size; scapular arch with the several coracoid elements represented; the brain has over the cerebellum a peculiar plicated organ; the air-bladder is simple, and communicates by a duct with the intestinal canal. The order is related to the more generalized form of *Teleocephali*, as well as to the *Nematognathi*. It is represented by but two known families, which are peculiar to the rivers of Africa; these are the *Mormyridæ* and *Gymnarchidæ*.

THEODORE GILL.

**Scyphozoa** [Gr. *σκόφος*, cup + *ζῷον*, animal]: one of the great divisions or classes of the Cœlenterata (q. v.), including the sea-anemones, coral-polyps, and the acraspedote jellyfishes. The group is differentiated from the other class (*Hydrozoa*) by the fact that there is an ectodermal œsophagus formed by the inpushing of the external skin through the mouth. As in all Cœlenterata, there is no distinction between the digestive cavity and body-cavity, but the common enteric cavity is complicated by folds of the outer wall

(septa) which increase greatly the amount of digestive surface. On these septa are borne thread-like gastral or mesenterial filaments which play an important part in digestion. The sexes are usually separate and the genital products (eggs and spermatozoa) arise from the entoderm. Two subclasses are recognized, the *Scyphomedusæ* and the *Anthozoa*. The *Scyphomedusæ* (except the lucernarians) are free-swimming solitary forms commonly known as jellyfishes, in which the body is umbrella-shaped or disk-like, the mouth being on the extremity of a longer or shorter proboscis, while the supporting layer (mesogloea) which lies between the ectoderm and entoderm of all Cœlenterata is developed into a thick gelatinous mass which makes up the bulk of the body. In the *Anthozoa* (often called *Actinozoa*) are included sessile, solitary, or colonial (compound) forms commonly called sea-anemones, coral-polyps, and the like. In these the body retains a more simple condition. It is more or less columnar, and the free end or oral disk is surrounded by a circle of tentacles, the number varying between wide limits (see below). In the center of the oral disk is the slit-like mouth, no proboscis being present. From the mouth the ectodermal œsophagus extends into the body, opening below into the large digestive chamber. In many forms the two ends of the mouth differ, one being for the taking in of water, while from the other flows out the water already used, carrying with it the indigestible particles taken in with the food. The digestive cavity is partially divided by the septa (already noticed), which are folds of the lining walls which project inward from the wall of the body like the spokes of a wheel from the rim toward the hub. The arrangement of these septa varies greatly, but in all cases there are at either one or both ends of the body (corresponding to the longer axis of the mouth) septa which differ from the rest and are consequently known as directives. The supporting layer is weakly developed, never attaining the thickness presented in the *Scyphomedusæ*. The *Anthozoa* are divided into orders chiefly upon the number and arrangement of the septa. In the OCTOCORALLIA (q. v.) the septa are eight, and there are usually eight feathery tentacles surrounding the oral disk. In the TETRACORALLIA (q. v.), a group of fossil forms occurring in the Palæozoic rocks, the septa are very numerous, but are always in multiples of four. In the HEXACORALLIA (q. v.) the tentacles are always in multiples of six, while the septa, except in a few instances—e. g. *Antipathus*, with two—follow the same law. J. S. KINGSLEY.

**Scyros:** See SKYROS.

**Scythe** [M. Eng. *sithe* < O. Eng. *sigðe*; Icel. *sigðr*; Germ. *sense* < O. H. Germ. *segansa* is from same root; cf. Lat. *scā're*, cut]: a long, curved blade, sharp on the concave edge, used in cutting grass. It is attached, for use, to a curved handle, called a snath. Shorter and stronger scythes are used for cutting bushes, etc. The introduction of mowing-machines has to a great extent superseded the use of scythes in haymaking, but where the former can not be employed scythes are still indispensable.

**Scyth'ia:** the ancient name for the vast regions which extend N., E., and S. of the Caspian Sea and the Sea of Aral. It was not so much used as a geographical term, for the boundaries of these regions were entirely undefined; it was rather a general term by which the Romans denoted a swarm of savage tribes living there, of whom they knew very little.

**Scythopolis:** the *Beth-shean* of Josh. xvii. 11, the *Beth-shan* of 1 Sam. xxxi. 10, now called *Beisan*, the most important city of the ancient DECAPOLIS (q. v.), and the only one W. of the Jordan, about 4 miles from that river, and nearly 14 miles S. of the Sea of Galilee. It was nearly as well watered as Damascus, four perennial streams running through it. It was a place of great strength, its acropolis rising 300 feet above the plain. The ruins, which are 3 miles in circuit, surpass all others in Western Palestine. Its classic name, *Scythopolis*, is of disputed derivation, but the old conjecture that there was there a remnant of the Scythians, who invaded Palestine on their way to Egypt (630 B. C.), is the most probable. Scythopolis was the seat of a bishopric in the fourth century A. D. The modern village, of some fifty houses, contains a colony of Egyptians established there by Ibrahim Pasha in 1848. Revised by S. M. JACKSON.

**Sea:** See OCEAN and PHYSIOGRAPHY.

**Sea-anemones:** See HEXACORALLIA and ACTINIDÆ.

**Sea-bass:** a serranoid fish (*Centropomus atrarius*) common on the Atlantic coast of the U. S. See FISHERIES.

**See** *Seal*: a division of authors of the genus *Callinectes* in the *Decapoda*, especially the northern species. *See* *Seal*.

**Seabury, Thomas D. De** Bishop; is Abington, Conn.; Nov. 21, 1801; son of Christopher of same name; graduated at Yale College, 1820; studied medicine and theology at Andover; was ordained a deacon and priest of the Church of England in 1825; was the longest of clergies at New Haven, N. Y., at Hampton Long Island, 1790-60, and at New Bedford, N. Y., 1790-75; was imprisoned at New Haven in the Revolutionary war of some Tory pamphlets, but soon escaped; resided in New York during part of the Revolutionary war; was in one time chaplain of a loyalist regiment; went to England 1784; was appointed Bishop of London in 1801; visited North America at Abington Nov. 14, 1801; during the first American bishop; took part in revising the American Bible and forming a constitution for the American Church; published the volume of *Sermons* (1791) and a collection of *Sermons*, contained the dates of his longest service at New London, Conn., until his death at New York Feb. 25, 1785. A posthumous volume of *Sermons* published 1808.

**Seabury, Thomas D. De** clergyman and author; son of Thomas Seabury, and grandson of Bishop Seabury; was New London, Conn. June 9, 1801; was ordained in the Episcopal Church 1820; was for several years a missionary at Hampton, Outer Bay, and Hallett's Cove, Long Island; was editor of *The American* (New York) 1841; rector of the Church of the Annunciation, New York; and Professor of History in the Episcopal Seminary at New York from 1842 to his death Nov. 10, 1872. Author of *The Continuity of the Church of England in the Seventeenth Century* (1831); *Christianity and the Slavery and Obligation of Conscience* (1831); *American Slavery and the Church of the Annunciation* (1831); *Thou and I* (1831); *Thou and I* (1831); and a posthumous volume of *Sermons on the Holy Spirit* (1874), edited by his son Thomas James Seabury, D. D., clergyman and author, was born at New York Jan. 25, 1847; graduated at Columbia College, New York, 1865; admitted to the bar and entered the General Theological Seminary (1866); became rector of the Church of the Annunciation, New York, 1868, and was Dean Professor of Ecclesiastical History in the General Theological Seminary since 1870. He was author of *Seabury's in Aid of Devotion and Study* (1872) and *The Introduction to the Study of English History* (1881).

**Seal** (from *Q. Fr. sel*; *Fr. seau*; *Ital. seello*; *Span. sello*). Lat. *sigillum*, dimin. of *signum*, sign, mark, stamp; strictly, at the common law, a piece of wax or other tenacious substance which has been affixed to the paper or parchment of an instrument in writing, and stamped with an impression for the purpose of legally executing or authenticating the instrument. The use of these seals becoming inconvenient, the custom is by extension applied also to the substitutes used for it, such as an impression made in the paper or parchment of the instrument itself, or a scroll or thread of the pen placed after the signature, or the letters L. S. The instrument by which the impression on the wax or other material is made is also called a seal. The use of the seal as a device for authenticating important instruments arose from the fact that in early times but could affix a written signature to the instrument made by them, and in place of such a signature they therefore used, with or without a mark or cross, seals with some heraldic or other device worked in relief to impress the wax. The use of the seal became especially associated with deeds and state papers because these then constituted the most important instruments which people had occasion frequently to authenticate. In using a seal it is not necessary that it should be affixed by the person whose and it is intended to be but he may adopt as his seal one affixed by another; and some seal may suffice for a number of signers of an instrument. The necessity for the use of a seal and the determination as to the kind of seal necessary in general depends upon the law of the place where the contract is made; but in the case of deeds always upon the law of the State in which the land is situated.

**Effect of Seal.**—The common law attributed a very high, but very arbitrary and technical, efficacy to the seal upon instruments of a private nature. A seal was essential to a valid conveyance of a freehold estate to land; and no contract was obligatory without a consideration, it established a conclusive presumption that there had been some valuable consideration. In some of the U. S. the common-law rule as to presumption of consideration was more or less abandoned, and in many States it is provided by statute that a seal on an executory contract shall be only *prima facie* evidence of a sufficient consideration.

**Statutory Regulation of Seals.**—In most of the U. S. the use of the seal is regulated by statutes, extending the application of the terms, and doing away with the old common-law rule with the use on private instruments, or with any distinction between such instruments when sealed and unsealed. The word "seal" or the letters L. S. may be used instead of a seal in Connecticut and New York. The seal may be used in place of a seal in Arkansas, California, Florida, Idaho, Illinois, Maryland, Michigan, New Mexico, North Carolina, Oregon, Pennsylvania, South Carolina, Virginia, and West Virginia; and in Minnesota, New Jersey, Wisconsin, and Wyoming any flourish or device intended for a seal may be used. The distinction between sealed and unsealed private instruments (except of corporations) has been abolished in Arizona, California, Colorado, Indiana, Iowa Territory, Iowa, Mississippi, Missouri, Montana, Nebraska, Nevada, North Dakota, Ohio, Oklahoma, South Dakota, Tennessee, and Utah; so that in these States and Territories the presence or absence of a seal does not affect the validity of the instrument. In Alabama an instrument purporting on its face to be a sealed instrument is taken to be sealed.

**Judicial Recognition of Seals.**—The public, or great, seals of all independent nations are universally recognized by the governments and tribunals of other civilized countries, so that public records, statutes, etc., when authenticated by their means are accepted as correct without further proof. The seals of isolation public are also regarded as proof of their own, especially in Europe, where the foot of the seal is an officer of greater dignity than in the U. S. The seals of the superior courts and of many administrative officers also receive judicial recognition, and require no proof in the territorial jurisdiction in which they belong; but in other jurisdictions they must be proved unless they are privileged by custom or statutory provisions.

*See American Law Review*, 60; *History and Use of Seals in England*, in vol. xviii, of *Archæologia* (London); *Blackstone's Commentaries*. F. STODOLSKY, ALBANY.

**Seal** [M. Eng. *sele* < O. Eng. *seolh* : O. H. Germ. *selah* : Icel. *sefr*] : a pinniped mammal of either of the families *Phocidae* or *Otariidae*. The name is applied more particularly to the members of the family *Phocidae*, the eared seals being termed fur seals or sea-bears and sea-lions. With the exception of a species (*Phoca sibirica*) inhabiting Lake Baikal, seals are marine, but some find their way into the lakes of Newfoundland, and they ascend rivers for considerable distances, a few having been taken even in Lakes Champlain and Ontario. They are more or less gregarious in habits, especially during the breeding season, when they are found in herds of thousands or hundreds of thousands on the ice-floes. As a rule, the female brings forth but one young, and this is covered with a soft woolly coat, which is shed in two or three weeks. Seals feed principally on fish, but also eat cuttlefish, crustaceans, and molluscs. They are capable of remaining beneath the water for five or ten minutes, or, according to some observers, even fifteen or twenty minutes, but if this be true, it is certainly exceptional. Those species which winter in the ice keep a hole open to which they come to breathe, a habit of which advantage is taken by hunters, who either wait by the holes and spear the animal as it emerges or else set a net over the hole.

Four genera of seals (*Stenorhynchus*, *Lobodon*, *Ommatophoca*, and *Leptonyx*), each with a single species, are peculiar to Antarctic seas, but nearly all species and individuals occur in the northern hemisphere, and for the most part in the frigid and colder portions of the temperate zone. The most familiar of the seals is the harbor seal (*Phoca vitulina*), a species common to both the eastern and western hemispheres, ranging from New York to Spain, along the northern shores of Europe and Asia, and down the Pacific coast of the U. S. to California. It attains a length of 5 or 6 feet; the general color is yellowish gray above, varied with markings of dark brown or blackish, lighter below, but it is subject to considerable variation. The Caspian seal (*Phoca caspica*) resembles the harbor seal, and is considered a descendant of that species, having entered the Caspian Sea when it was a branch of the Arctic Ocean, and become modified by isolation. The harbor seal is found on the coast in small bands. The largest of the seals (excepting the ELEPHANT SEAL and SEA-LEOPARD, *qq. v.*) are the bearded seal (*Erignathus barbatus*) and the gray seal (*Halichoerus grypus*), each of which attains a length of 8 or 9 feet, although they are said to grow even larger. The gray seal is found only in the North Atlantic and the Baltic, while the bearded seal is circumpolar. Both are less gregarious than the other species. The gray seal, as its name implies, is free from markings, while the bearded seal is blotched with brown or blackish. The netsick, or ringed seal (*Phoca fastida*), is a species resembling the harbor seal, but is smaller, and has light markings in the form of rings surrounding oblong dark patches. This species is prized by the Eskimo, as it winters in the Arctic regions and forms an important article of food.

The curious hooded or, more correctly, bladder-nosed seal (*Cystophora cristata*) attains a length of 7 or 8 feet, and derives its name from the fact that the males possess the power of inflating the skin about the nose. It is usually incorrectly figured with the hood on top of the head. It is a northern species, and is not found in herds. See Allen, *History of North American Pinnipeds* (Washington, 1880); Elliott, *Seal Islands of Alaska* (Washington, 1881); *Fishery Industries of the United States*, Quarto Fishery Report (Washington, 1884-87). See also HARP-SEAL, MONK-SEAL, OTARIIDÆ, PHOCIDÆ, SEAL-FISHERIES, and SEA-LION.

F. A. LUCAS.

**Sea-lavender** : See MARSH-ROSEMARY.

**Sealchraig** : See SELKIRK, ALEXANDER.

**Seal-engraving** : See GEM.

**Sea-leopard** : an Antarctic seal (*Stenorhynchus leptonyx*) named from its spotted coat of gray and white. Aside from the sea-elephant it is the largest of the southern hair-seals and one of the most abundant. It attains a length of 10 feet, and the crowns of the molars are divided by deep notches into three portions.

F. A. L.

**Seal-fisheries** : industries which consist in the capturing of seals for commercial purposes, and which may be said to have arisen toward the end of the eighteenth century; though the walrus, a near relative of the seal, had been systematically pursued for at least 200 years before, comparatively few hair or fur seals appear to have been taken prior to 1790. In the present condition of the seal-fisheries

it is often found advisable to take different kinds of seals on the same voyage, or to combine the seal-fishing with the whale-fishing, especially in the Antarctic fisheries.

The principal seat of the hair-seal fishery is off the coast of Newfoundland and Labrador, the value of the seals taken there exceeding that of the catch elsewhere. Still larger numbers of seals are taken in the Gulf of St. Lawrence,

The common seal.

near Nova Zembla and Jan Mayen islands, in the White and Caspian Seas, and on Kerguelen and Heard islands in the South Pacific, as well as at other points in the Antarctic Ocean. The harp-seal (*Phoca groenlandica*) is, commercially, the most important of the hair-seals, but the hooded seal, or bladder-nose (*Cystophora cristata*), the square flipper (*Erignathus barbatus*), and the Caspian seal (*Phoca caspica*) are all taken in considerable numbers. The southern sea-elephant (*Macrorhinus proboscideus*) in times gone by has furnished an enormous amount of oil. The California sea-elephant (*M. angustirostris*) and the Caribbean seal (*Monachus tropicalis*) have been practically exterminated. Within the last few years some of the large southern seals (*Stenorhynchus*, *Lobodon*, *Leptonyx*) have been taken, but there can hardly be said to be a regular fishery for them, and it is not probable that their capture would long prove remunerative. The most important part of the Newfoundland seal-fishery is carried on by steamers, and these are also employed in the Nova Zembla and other northern fisheries, having practically superseded sailing craft where the seals are taken on the ice-floes at some distance from land. Many seals are still taken near shore by nets or by shooting. Between twenty and thirty steamers are engaged in the Newfoundland fisheries, which also employ not far from 5,000 men, although only for a short time, as the season is from Mar. 10 to May 1. In the most flourishing days of the seal-fishery 8,000 to 10,000 men were engaged. In 1892 the Newfoundland sealers took 3,000, 174 seals, the value of skins and oil being \$865,784, but in 1893 the catch was only 129,061 seals. The annual product of the Norwegian fishery is about \$300,000. The seals are taken on the ice which drifts down from the north, and the major part are the newly born young, which have never left the ice and are excessively fat. They are killed with clubs, and heaped up on the ice until a pause in the slaughter will admit of their being skinned. The pelt, with the attached blubber, weighs from 20 to 40 lb. Seal-skin leather is well known; the oil is used for tanning and lubricating purposes, and for making soap. It varies much in quality, according to the care used in its preparation, but the best is limpid and almost devoid of taste or odor. The sea-elephant is taken chiefly on Kerguelen and Heard islands and the Crozets, but some are killed on Macquarie island by the New Zealand sealers, and other localities are visited from time to time with more or less success, much depending on the length of time they have been left undisturbed. New London, Conn., is the principal port from which the sea-elephant and southern fur-seal fishery is prosecuted, the vessels being generally carried on by the same vessel. The vessels employed are stout schooners of 75 to 150 tons, well provided with boats, and it is customary to land parties of men on the islands, and leave them to kill the animals and try out the oil, or, in the case of the fur-seals, to salt down the skins. Or, again, as at Kerguelen and Heard islands, the vessels may be anchored in the best harbor obtainable, while the greater part of the crew live on shore. The Antarctic seal-fisheries are very arduous, for the climate is severe and storms are frequent, while at the same time a successful voyage is by no means a certainty.

*Miscellaneous Diseases.*—Various other individuals are sent by statute requesting the register and duties of masters, limiting the consumption of the vessel, a proper supply of provisions and medicines that return from foreign ports when there discharged, extra wages to each of master and discharge, insurance upon vessels and foreign ports, the duty of providing and maintaining, and a summary record in the U. S. for destitute seamen of the U. S., and providing for

the establishment of marine hospitals and relief funds by collections from the wages of seamen, etc. Seamen must submit to the usual punishments lawful and agreed upon in the shipping articles, such as short allowance, being put in irons, etc.; but flogging has fallen into disuse, and in the U. S. has been abolished by statute.

For a full treatment of the rights and duties of seamen, see the statutes; Maude and Pollock's *Compendium of the Law of Merchant Shipping* (London, 1881); Abbott's *Law of Merchant Shipping* (London, 1892); Kay's *Law of Shipping and Seamen* (London, 1875); Parson's *Law of Shipping* (Boston, 1869); Desty's *Revised Statutes of the United States relating to Commerce, Navigation, and Shipping*. See also COURTS for the Admiralty Courts.

F. STURGES ALLEN.

**Sea-mouse:** a popular name for marine annelids of the genus *Aphrodite*, remarkable for the beautiful colors produced by the hairs of the animal.

**Sea of Cortes:** See CALIFORNIA, GULF OF.

**Sea of Sodom, or Sea of the Plain:** See DEAD SEA.

**Sea-otter:** See OTTER.

**Sea-pie:** See OYSTER-CATCHER.

**Sea-raven:** See SCULPIN.

**Search:** See INTERNATIONAL LAW (*Summary*).

**Search and Seizure:** the examination and taking into custody of one's person or property. The fourth amendment of the U. S. Constitution provides that "the right of the people to be secure in their persons, houses, papers, and effects against unreasonable searches and seizures shall not be violated, and no warrants shall issue but upon probable cause, supported by oath or affirmation, and particularly describing the place to be searched and the persons or things to be seized." A similar provision exists in each State constitution. It is declaratory only of common-law principles, which were clearly announced in *Wilkes vs. Wood* (19 State Trials 1153, A. D. 1763), *Leach vs. Money* (*ibid.* 1001, A. D. 1765), and *Entick vs. Carrington* (*ibid.* 1030, A. D. 1765). The first two cases decided that a general warrant to seize some person or papers not named was illegal, and the third declared a warrant to seize the papers of a person named to be equally illegal. Lord Camden's judgment in the last case is celebrated for its learning and ability, and is regarded "as one of the permanent monuments of the British Constitution."

Some searches and seizures were permitted by the common law, and do not fall within the constitutional inhibition. They may be resorted to for the recovery of stolen goods, or in the case of excisable or dutiable articles, or in the case of things whose possession or sale is forbidden by law, such as burglars' tools, gambling apparatus, intoxicating liquors, and others, or for the purpose of levying an attachment or execution. Even in such cases, however, the law does not authorize the use of general search warrants, but requires the magistrate to have satisfactory evidence upon oath that a case of the kind mentioned probably exists, and to have a particular description of the place to be searched, and of the persons or things to be seized. The warrant must also name the place and the person or thing to be searched and seized. If an officer attempts to arrest a person under a general warrant, or under one which does not truly name or sufficiently identify him, he may resist the officer, and if the latter makes the arrest, he is liable for false imprisonment. (*West vs. Cabell*, 153 U. S. 78.) In some of the States statutes authorize officers to seize intoxicating liquors without a warrant, in the first instance, but the officers are required to obtain promptly a warrant therefor, or they become liable as trespassers. *Weston vs. Carr*, 71 Me. 356.

Searches and seizures which are resorted to not for the purpose of capturing stolen property, or that which is under the ban of positive law, or of levying legal process, are deemed unreasonable. Accordingly, a statute providing for the issuing of warrants by judges of insolvency on the complaint of an assignee to search for property of the debtor has been declared unconstitutional. (*Robinson vs. Richards*, 79 Mass. 454.) The U. S. Supreme Court held a statute to be unconstitutional which authorized a court, in revenue cases, on motion of the Government's attorney, to require the defendant or claimant to produce in court his private books, invoices, and papers, or else the allegations of the attorney should be taken as confessed. (*Boyd vs. United States*, 116 U. S. 616.) The provision was deemed tantamount to a

compulsory production of a man's private papers, and to effect the sole object and purpose of search and seizure; hence it was declared to be within the scope of the fourth amendment. The language of Lord Camden in *Entick vs. Carrington* was regarded as expressing the true doctrine of the subject of searches and seizures, and as furnishing the true criteria of the reasonable and unreasonable character of such seizures. It was said that the principles laid down in that opinion affect the very essence of constitutional liberty and security. They reach further than the concrete form of the case then before the court; they apply to all invasions on the part of the Government and its employees of the sanctity of a man's home and the privacies of life. It is not the breaking of his doors and the rummaging of his drawers, but the invasion of his indefeasible right of personal security, personal liberty, and private property, where that right has never been forfeited by his conviction of some crime, that constitutes the essence of the offense.

FRANCIS M. BURDICK.

**Searcy:** town; capital of White co., Ark.; on the Little Red river, and the Searcy and West Point Railroad; 55 miles N. E. of Little Rock, the State capital (for location, see map of Arkansas, ref. 3-D). It is an important shipping-point for cotton and fruit; has several alum, chalybeate, and sulphur springs, which have made it popular as a health resort; and contains Searcy College, for males (Methodist Episcopal, South), Galloway Female College, Searcy Female Institute, a public school, a State bank with capital of \$30,000, and a daily, a monthly, and three weekly periodicals. Pop. (1880) 840; (1890) 1,203; (1895) estimated, 3,500. EDITOR OF "CITIZEN."

**Searles, WILLIAM HENRY:** civil engineer; b. in Cincinnati, O., June 4, 1837; graduated at the Rensselaer Polytechnic Institute in 1860, where later he was Professor of Topography and Road-engineering for three years. He has been locating and constructing engineer on many railways, and is the author of *Field-engineering* (1879) and *The Railroad Spiral* (1882).

**Sea-robin:** See GURNARD.

**Sears, BARNAS, D. D., LL. D.:** theologian and educator; b. at Sandisfield, Mass., Nov. 19, 1802; graduated at Brown University 1825, and at Newton Theological Seminary 1829; was pastor of a Baptist church at Hartford, Conn., 1830-32; was afterward Professor in the Literary and Theological Institution at Hamilton, N. Y. (now Colgate University); studied theology at German universities 1833-36; was professor in Newton Seminary 1836-48, acting as president during the later years; succeeded Horace Mann as secretary of the Massachusetts board of education 1848-55; was president of Brown University 1855-67, and after that the general agent of the Peabody Educational Fund. He was several years editor of the Baptist *Christian Review* (1837-39), a regular contributor to *Bibliotheca Sacra*, and author (with Edwards and Felton) of *Classical Studies* (1843), *The Ciceronian* (1844), and *The Life of Luther* (1850). He edited Nöthden's *German Grammar* (1842), *Select Writings of Luther* (1846), and Roget's *Thesaurus* (1854), and published many addresses, educational reports, and miscellaneous essays. During his stay in Europe he baptized in the Elbe near Hamburg, by night and stealthily, in order to avoid legal prosecution and police persecution, I. G. Oncken and six others, who formed the first German Baptist church in communion with the Baptists of England and the U. S. b. at Saratoga Springs, N. Y., July 6, 1880.

Revised by C. H. THURBER.

**Searsport:** town; Waldo co., Me.; on Penobscot Bay, 6 miles E. N. E. of Belfast, the county-seat, 27 miles S. W. of Bangor (for location, see map of Maine, ref. 9-E). It is principally engaged in ice-gathering, ship-building, hay-shipping, and the lumber-trade, and contains saw and grist mills, spool-mill, poultry-farms, the Sears Public Library (opened in 1872), a national bank with capital of \$50,000, and a savings-bank. Pop. (1880) 2,322; (1890) 1,693. Rev. ROBERT G. HARBUTT, FIRST CONGREGATIONAL CHURCH.

**Sea-serpent:** a gigantic marine animal, said to have been seen in various localities, but never captured, and regarded by most zoölogists as purely mythical. The earliest references to the sea-serpent are to be found in Norse literature, where frequent mention is made of the *Sæ-Orin*. In 1557 the creature was described by Olaus Magnus in his work *Historia Gentium Septentrionalium*, where its length is set down as 200 feet and girth 20 feet. In 1734 the Rev. Paul

impressions due to the rocking. In many persons a few mild doses of calomel before the voyage prevent the occurrence of seasickness. In others a little bromide of potash, soda-water, or saline draughts suffice. Persons who are specially liable sometimes escape entirely by preserving a horizontal position during most of the voyage. W. P.

**Seaside-grape:** a small polygonaceous tree (*Coccoloba uvifera*) of Florida and the West Indies, producing the extract called Jamaica kino. (See KINO.) It has clusters of purple edible fruit, and a beautiful hard wood, which yields a red dye.

**Sea-squirt:** any one of the ASCIDIA (*q. v.*).

**Sea-swallow:** See GURNARD.

**Seattle**, see-at'll: city; capital of King co., Wash.; on Puget Sound, and the Gt. Northern, the N. Pac., the Columbia and Puget S., and the Seattle, Lake Shore and East. railways; 28 miles N. of Tacoma (for location, see map of Washington, ref. 3-D). It lies on the east side of Admiralty Inlet, between Elliot Bay (salt water) and Lake Washington (fresh water). The contour of the city is hilly, with valleys running N. and S. The steep rise of the hills from the water of the sound presents a striking view, especially when approached in the evening. This is enhanced by two snow-capped ranges, the Olympics on the W. and the Cascades on the S. E., and by Mt. Rainier, rising in the south to a height of 14,444 feet. The city has seven public parks—the City, Denny, Kinnear (each partially improved), Madrona, Leschi, Ravenna, and Woodland—some of which afford scenery of rare natural beauty. The business districts are covered with handsome and substantial buildings, nearly all erected since the great fire of 1889.

**Climate.**—The summers are cool and pleasant; the rainy season is broken by much good weather; the annual range of temperature is from 10° to 88°; the rainfall in 1893 was 45 inches. A peculiar feature of the climate is that the rainy season is more healthful than the dry season. The death-rate is about 8 in 1,000. Ocean storms spend their force on the Olympic Mountains before reaching the city.

**Public Buildings.**—The county court-house occupies a prominent site overlooking the city; the county almshouse and hospital is a fire-proof structure which cost over \$80,000. The Roman Catholic Church maintains Providence Hospital and the House of the Good Shepherd, a reformatory for girls. There is an efficient board of associated charities. The Public Library (founded in 1872) is supported by a percentage of the criminal fines, and has spacious rooms and a large patronage. Terms of the U. S. circuit and district courts are held here, and a U. S. land-office, U. S. custom-house, U. S. weather bureau, and the board of U. S. inspectors of steam-vessels for Washington and Alaska are located here.

**Churches and Schools.**—Seattle contains 12 Methodist Episcopal churches, 9 Baptist, 5 Congregational, 5 Presbyterian, 5 Lutheran, 4 Protestant Episcopal, 3 Roman Catholic, 8 Disciples, 3 German Evangelical, 3 Methodist Protestant, 2 Jewish, and one each Advent, Free Methodist, Reformed Presbyterian, and Unitarian, besides a Salvation Army barracks, and 17 missions. The public-school system has a large endowment of State lands. There are 16 public-school buildings (which cost, with land, \$673,000), with (1893) 184 teachers and 6,424 pupils; 2 parochial schools, several private kindergartens, and girls' schools. The State University occupies a fine site on 341 acres of school land within the city limits, and has about 500 students and a valuable library, practically public. There are also a Baptist university, Seattle Female College, College of the Immaculate Conception, and the Academy of Holy Names. The Workmen's Guild supports a library. In 1894 there were 8 daily, 16 weekly, a semi-monthly, and ten monthly periodicals.

**Finances and Banking.**—In 1894 the city receipts were \$553,630; expenditures, \$591,000; the bonded debt was \$3,540,000; the assessed property valuation, \$32,752,153; tax-rate, 12.5 mills. There were 7 national, 3 savings, and 5 private banks. Seattle has never had a bank failure.

**Business Interests.**—The manufactories number 331, with \$4,758,283 capital invested and \$10,203,007 value of product, and include sawmills, a flour-mill, breweries, extensive drain-tile and brick works, foundries, boiler-works and machine-shops, sash and door factories, furniture factories, bookbinderies, tanneries, manufactories of tinware, shoes, crackers, soap, and ice, creosoting works, ship-building yards, etc. There is a large business in the wholesale shipments of fresh fish. There are 91 miles of street-railways, of which 22

miles are cable road and 69 miles electric. These lines are also used for freight. The cable lines run over the highest hills, which are the choice residence districts. Every portion of the city is easily accessible. The commercial advantages of Seattle are remarkable. By water there is regular steamship connection with the Orient, with San Francisco, and Alaska. The railway connections are superior to those of any point on the Pacific coast, four transcontinental lines competing for business, two of which have their terminals in the city. Lumber, grain, and coal are shipped to all parts of the world. The city is the center of trade for all the numerous small steamers, called the mosquito fleet, plying to the ports of Puget Sound, which has about 1,300 miles of coast-line. An immense business in cedar shingles and lumber has been developed, and shipments by rail extend to the Atlantic coast. A company has been formed for the utilization of Snoqualmie Falls by electrical transmission of power. Large sums have been invested in a steel plant. An appropriation has been secured from the U. S. Government to begin the construction of a canal connecting Puget Sound through Lake Union with Lake Washington. The lake is about 25 miles in length, and does not freeze in winter. Vessels scour their bottoms in fresh water and avoid the expense of docking. The lake is surrounded with valuable deposits of coal and iron, and with fine bodies of timber. By the canal a landlocked harbor would be formed of great value to the Government in connection with the dry dock at PORT ORCHARD (*q. v.*). A second company has entered into a contract with the State providing for a second canal S. of the city.

**History.**—Seattle, named from an Indian chief, was founded in 1852. It remained a village until 1880. An important episode in the early history was the protection of the Chinese by a vigilance league, which prevented the triumph of the lawless elements. The city early became the central commercial point for the Puget Sound region. On June 6, 1889, it experienced a conflagration which destroyed property valued at \$15,000,000, but one brick building remaining in the business district. Seattle was the first large city to free its streets of horse-cars.

Pop. (1880) 3,533; (1890) 42,837; (1892) State census, 58,898; (1894) estimated, 60,000.

WALLACE NUTTING.

**Sea-unicorn:** See NARWHAL.

**Sea-urchin:** See ECHINOIDEA and PALEONTOLOGY.

**Seaweeds:** the popular name for the plants which grow in the sea, often extended so as to include all aquatic plants whether growing in salt or fresh waters. They are also known as ALGÆ (*q. v.*), sea-mosses, and sea-ferns (although they are neither mosses nor ferns). In this wide sense seaweeds belong to no less than six different classes of the vegetable kingdom, viz.: (1) *Schizophyceæ*, the fission algae, mostly microscopic and usually blue-green or smoky green, inhabiting fresh and salt waters; (2) *Chlorophyceæ*, the green algae, mostly microscopic, green (sometimes obscured by brown coloring-matter), inhabiting fresh and salt waters; (3) *Phæophyceæ*, the brown algae, including FUCOIDS and KELP (*q. v.*), mostly of large size, green (but obscured by brown coloring-matter), inhabiting salt waters; (4) *Coleocetaceæ*, the simple fruit-tangles, microscopic, green, inhabiting fresh waters; (5) *Rhodophyceæ*, including one order (*Florideæ*), the RED SEaweeds (*q. v.*), usually of considerable size, green (obscured by red coloring-matter), inhabiting salt waters; (6) *Charophyceæ*, the STONEWORTS (*q. v.*), mostly large plants, green, inhabiting fresh waters. These plants do not constitute, therefore, a single natural group, although usually so treated.

CHARLES E. BESSEY.

**Sea-wolf:** See WOLF-FISH.

**Sebaceous Glands:** See HISTOLOGY (*The Skin and its Appendages*).

**Sebac'ic** (also called **Sebic** and **Pyroleic**) Acid [*sebacic* is from Lat. *sebum*, tallow; *pyroleic* is from Gr. *πῦρ*, fire + Eng. *oleine*]: a compound with the empirical formula  $C_{18}H_{34}O_2$ , formed during the destructive distillation of all fatty bodies which contain oleic acid or olein. Nitric acid forms it also when acting upon fatty bodies, together with oxalic acid and other lower homologues of the same series, or those having the general empirical formula  $C_nH_{2n-2}O_2$ , a series of which *malonic*, *succinic*, and *suberic* acids are members. Sebacic acid is most readily obtained by fusing together castor oil and caustic potash, 2 parts of oil being slowly mixed with one part of potash, fused with a little water, and heated until the mass is faintly yellow. After boiling

Charles II. of Bavaria, who, after the death of Charles VI., laid claim to parts of the Austrian heritage, in spite of the Pragmatic Sanction, and was elected emperor under the name of Charles VII.; commanded his army with success; expelled the Austrians from Bavaria, and succeeded in negotiating a tolerable peace for his son in 1745. After this time he lived quietly on his estate, Meuselwitz, near Altenburg, in the Saxon duchies, but in 1758 he was imprisoned by Frederick II. for six months, and forced to pay a heavy fine. D. at Meuselwitz, Nov. 23, 1763.—In the nineteenth century several members have acquired a name as poets: (3) LEO (1773-1809); (4) KARL SIEGMUND (1744-85), translator of Camoëns; (5) CHRISTIAN ADOLF (1767-1833); (6) GUSTAV ANTON (1775-1823), known also in the U. S. as a lecturer under the name of PATRIK PEALE. F. M. COLBY.

**Second Advent:** the visible reappearance of our Lord in the world since his ascension to heaven. More exactly, inasmuch as he revisited the world visibly to call the apostle Paul, the second advent denotes a return visible to all the world, or to the whole Church, or to an elect first-fruits of the Church. The first and the third opinion represent two schools of Christian belief. Beyond question, our Saviour himself promised to return visibly. Even assuming (Matt. xxiv., Mark xiii., Luke xxi.) to give his promise intermixed with later interpretations, the unmistakable foundation is a word of his own, which, moreover, is implied throughout the four Gospels, including John (see John v. 25, 28; vi. 39, 40; xiv. 3, 18), and throughout the Epistles of Paul, Peter, John, James, and Jude. The Revelation is full of it. Indeed, next to the Messiahship of Jesus, it has well been called the first Christian doctrine.

In the Gospels our Saviour seems to identify his coming with the fall of Jerusalem. When an evolving event includes many stages, even though widely apart in time, prophecy very commonly blends these in one, inasmuch as the subsequent stages are only an explication and amplification of the first. As has been truly said, prophecies of fundamental import have a springing and germinant fulfillment in every age. The prophecies of the first advent show the same blending of imperfect fulfillments, in which God came near to his people with the consummate fulfillment, in which God, though unrecognized, was with his people. Even so, as the fall of Jerusalem released Christ in his Church from the threatening constraint of Judaism and set him and her free for their victorious course in the world, it was a true and indeed visible return of Christ, with which he therefore fuses every fuller accomplishment of his promised return, even to the consummate fulfillment at the end. He himself, as incarnate, denies of himself any other than a restricted knowledge of times and seasons, which implies a restricted knowledge of specific phases of evolution in the Parousia, or second advent. Only two things are distinct: One, that everything which he foretells shall, in a real sense, come to pass in that generation; secondly, that his coming may be, in its absolute and final sense, long delayed, giving occasion to despondency in some of his people and to licentious security in others. This fusion of different stages of the Parousia is the more obvious, as Christ's visible return is only the highest, coercive evidence of his spiritual return, sight being used as the most convincing and most spiritual bodily sense.

The Revelation alone of the New Testament books describes the second advent as separated by an earthly reign of 1,000 years from the last judgment and reconstitution of all things. Accordingly, since A. D. 200 until of late, this opinion has never had much currency in the Church. It seems to be regaining ground. C. C. STARBUCK.

**Secondary Era:** a division of geologic time co-ordinate with Primary, Tertiary, and Quaternary eras. A synonym in more general use is MESOZOIC ERA (*q. v.*).

**Secondary Schools:** See SCHOOLS.

**Secretary:** in the U. S., the name of the officer of the cabinet, the respective heads of the executive departments of State, War, Navy, the Treasury, the Interior, and Agriculture. For an account of their duties, see the articles on these departments.

**Secretary-bird:** a bird of prey (*Gypogeranus serpentarius*), which owes its popular name to a crest of feathers at the back of the head which suggests a pen tucked behind the ear of a scribe. On account of anatomical peculiarities the bird is placed in a distinct family (*Gypogeranidae*). The secretary-bird is readily distinguished from all other birds

of prey by the disproportionate length of its legs, for while the body is smaller than that of a golden eagle, the legs are 2 feet long. The toes are short, nails blunt; the general color is grayish blue, with blackish markings on wings, tail, and under side. The bird feeds on rats and snakes, even on the venomous species, grasping them with its long legs and using its outstretched wing as a shield on which to receive the fangs of its prey. It is found throughout Southern Africa, W. of lat. 15°, and in Cape Colony is protected by law. F. A. LUCAS.

**Secret, Discipline of the:** an English equivalent of ARCANI DISCIPLINA (*q. v.*).

**Secretion** [from Lat. *secre'tio*, a setting apart, separating, deriv. of *secer'nere*, separate; *se-*, apart + *cer'nere*, distinguish, separate]: one of the chief physiological processes of the body; the separation of certain elements of the blood, and their elaboration to form special fluids, termed secretions and excretions. Both of these products contribute to the health and nutrition of the body, the secretion performing some positive function, as aiding digestion; the excretion subserving the same purpose negatively by freeing the system of effete matter, the *débris* of cell and tissue, which if detained in the blood develops disease. The function of the perspiratory and sebaceous glands is secretory, so far as they preserve the moisture and delicacy of the skin, but is chiefly excretory, eliminating water and various effete matters from the system, and hence is classed as an excretion. Bile is variously defined as a secretion, an excretion, and as both, its constituents being effete substances deleterious to health if not promptly excreted, yet performing an important part in the process of intestinal digestion.

Secretion is performed in several ways. The simplest form is seen in the serous shut sacs which invest the lungs, heart, and intestines—the pleuræ, pericardium, and peritoneum. These are lubricated by a fluid which filters directly through the flat endothelial lining cells from the blood-vessels beneath; so also are produced the synovial fluids of the inner smooth surfaces of the joints. A more typical secretory structure is the *tubule*, a cylindrical recess or tube at right angles to the surface, lined with secreting cells. Secreting surfaces, as the mucous lining of the bronchial tubes, stomach, and bowels, have many hundreds or thousands of such tubules to the square inch. An isolated group of tubules ramifying from a single central duct constitutes a simple gland; a number of such groups having a common duct is a compound gland; the larger glands, composed of an extensively divided tubular system with corresponding lobules, are termed racemose glands—that is, in structure resembling a cluster of berries. Such complicated glandular structures serve merely to multiply secreting surface within a limited space; the functional action is much the same whether performed on the free surface, in the tubule and follicle, or by the multiple gland. Secretion is the product of cell-activity. The cell derives its material from the blood, its stimulus to action from the nervous system, and it elaborates a peculiar fluid, in each instance predetermined by the inherent function of the gland or organ of which it is an integral part. Secreted fluids are homogeneous, consisting chiefly of water with variable quantities of salts and fatty matter, and in each case a distinguishing component, as pepsin in gastric juice and mucin in mucus.

Revised by W. PEPPER.

**Secular Clergy:** See CLERGY.

**Secular Games** [translation of Lat. *ludi sæculares* (also known as *ludi Terentini*); *ludi*, plur. of *ludus*, game + *sæcula' res*, plur. of *sæcula' ris* (whence Eng. *secular*), of a century, deriv. of *sæculum*, century]: games celebrated in ancient Rome in honor of the infernal deities Dis and Proserpina. The festival seems to have been of Etruscan origin, and to have been connected with a belief in the existence in the life of the state of great periods whose beginning and end were marked by special portents from the gods. Such a period was supposed to be equal to the longest human life, and was variously computed at 100 and 110 years. Owing to the different modes of reckoning, the games were not held at regular intervals. The first well-attested instance of their celebration at Rome was in 249 B. C. Secular games were again held in 146 B. C., and under the empire in 17 B. C., and in 47, 88, 147, 204, 248, and 262 A. D. An inscription has recently been discovered giving an account of the celebration of the games under Augustus in 17 B. C.; it was for this occasion that Horace wrote his *Carmen sæculare*.

G. L. HENDRICKSON.

of Missouri, ref. 4-F). It was laid out by Gen. G. R. Smith from a part of his farm in 1861, was a U. S. military post during the war of 1861-65, and for several years was the west terminus of the Mo. Pac. Railway. Gen. Nathaniel Lyon and Gen. John C. Frémont fitted out military expeditions here in 1861, and for a few days in 1864 the city was held by Confederate troops. The city has an elevation of 986 feet above sea-level, and is in an agricultural, coal-mining, and limestone region, which has also beds of emery and potter's clay, and indications of iron, lead, and zinc. Sedalia contains 23 churches, 13 public schools, a high-school building that cost \$40,000, George R. Smith College, public library with over 10,000 volumes, court-house (erected in 1884, cost \$115,000), new U. S. Government building, 3 national banks with combined capital of \$300,000, 2 State banks with capital of \$350,000, 10 building and loan associations, and 8 daily, 7 weekly, and 2 monthly periodicals. The locomotive-shops of the Mo. Pac. Railway and the general offices and car-shops of the Mo., Kan. and Tex. Railway are located here. There are also flour-mills, iron-foundry, woolen-mills, machine-shop, agricultural-implement works, brewery, grain elevator, and carriage and broom factories. Pop. (1880) 9,561; (1890) 14,068. THOMAS SEDDON.

**Sedan**, Fr. pron. se-dāān': town; in the department of Ardennes, France; on the Meuse; 64 miles by rail N. E. of Rheims (see map of France, ref. 2-H). It contains an arsenal and several magazines, and was at one time a place of great military importance. It has manufactures of cloth and other kinds of woolen fabrics. Metal-working is also carried on. The Protestants had here a flourishing academy, which was closed by the revocation of the Edict of Nantes in 1685. On Sept. 2, 1870, Napoleon III. and his whole army of 86,000 men surrendered here to the King of Prussia. Pop. (1891) 17,023.

**Sedan-chair**: a portable vehicle differing from the litter and the palanquin in that the traveler is carried in a sitting posture by two men. The sedan-chair took its name from Sedan in France, where it was invented, but it had long been employed in Eastern countries, notably in India and China. It was first seen in England in 1581.

**Sedatives** [from Lat. *sedare*, *sedatus*, make sit, settle, compose, calm]: a term somewhat loosely employed in medical parlance to designate agents which are soothing or actually anæsthetic over the sensory function, or which in relation to various motor functions tend to diminish activity. Aconite, hemlock, and chloroform are thus called sedative—the first, because it lessens the force and frequency of the heart's beats; the second, because it paralyzes the voluntary muscular system; and the third, because it is a general paralyzer of the cerebro-spinal functions. From these examples it is obvious enough that there is no group of allied agents to which the general term sedative can apply; and where used in relation to special paralyzing power the latter term is far more accurate and expressive.

**Sedge Family**: the *Cyperaceæ*; a group of grass-like, monocotyledonous, herbaceous plants, numbering 2,500 to

flowers are greatly reduced from the lily type, having three stamens (rarely more) and a one-celled ovary with two or three carpels, which contains a single basifixed, anatropous ovule, the latter developing into a free seed. The perianth is wanting, or at most rudimentary, and the plants are often monœcious or diœcious.

Sedges are common in all parts of the globe and are particularly abundant upon low and wetlands. They are usually not so nutritious as the grasses, but constitute a large proportion of the coarse hay which is cut from wet meadows. The largest genera of the family are *Cyperus* (containing from 400 to 500 species), *Fimbristylis* (200), *Scirpus* (200), *Rhynchospora* (150), *Scleria* (100), and *Carex* (500). See the articles *CAREX*, *CYPERUS*, and *PAPYRUS*.

**Sedgemoor**: a wild region of Somersetshire, England, extending S. E. from Bridgewater. On July 6, 1685, the Duke of Monmouth, son of Charles II. of England by Lucy Walters, was defeated here by the army of James II. under the Earl of Faversham. The duke was taken prisoner, and executed July 15, 1685. See Blackmore's *Lorna Doone*.

**Sedgwick**, ADAM, LL.D., F. R. S.: geologist; b. at Dent, Yorkshire, England, in Jan., 1786; graduated at Cambridge 1808; became fellow of Trinity College 1810; took orders in the Church of England 1817; was appointed Woodwardian Professor of Geology at Cambridge 1818; chosen fellow of the Royal Society 1819; became proctor of the university 1827; president of the Geological Society of London 1829-31; received the Copley medal of the Royal Society 1863. D. at Cambridge, Jan. 27, 1873. His geological studies covered wide areas in continental Europe as well as Great Britain, but the older sedimentary rocks of England and Wales were his special field. In classifying these he first announced the Cambrian as a system below the Silurian; and a question as to the position of the line separating the two systems occasioned a long controversy with Murchison, involving much bitterness and personal feeling. He was an active opponent of the doctrine of evolution. His works consist chiefly of reviews, lectures, addresses, and memoirs, scattered through the publications of learned societies, the most important separate essays being a *Discourse on the Studies of the University of Cambridge* (1834; enlarged ed. 1850) and a *Synopsis of the Classification of the Palæozoic Rocks* (1855). See CAMBRIAN PERIOD, and consult Geikie's *Memoirs of Sir R. Murchison* (1874) and Hunt's *Chemical and Geological Essays* (1875).

**Sedgwick**, CATHARINE MARIA: author; daughter of Judge Theodore Sedgwick; b. at Stockbridge, Mass., Dec. 28, 1789; undertook after her father's death (in 1813) the management of a private school for the education of young ladies, and continued in that employment fifty years. She published her first work of fiction, *A New England Tale*, in 1822, the success of which decided her to continue the career of authorship; brought out *Redwood* (2 vols., 1824), which was reprinted in England, translated into French, Italian, German, and Swedish, and compared favorably with the novels of Cooper, to whom, indeed, it was attributed in the French version; and was the author of other popular works, including *The Traveller* (1825); *Hope Leslie, or Early*

FIG. 2.—Papyrus (*Cyperus papyrus*).

FIG. 1.—A sedge (*Carex umbellata*) reduced, with enlarged perigynium and bract at left, and pistil and transverse section at right.

8,000 species. Their stems are usually solid and three-angled, and their leaves three-ranked, with closed sheaths. The

See, HORACE: naval engineer and architect; b. in Philadelphia, Pa., July 19, 1835. He was educated at the Academy of the Protestant Episcopal Church and the Gregory Academy; became, after entering business life, interested in steamship construction. From 1887 to 1889 he was the superintending engineer of the works of William Cramp & Sons, at Philadelphia, and introduced many improvements into the design and manufacture of the steam-engine. He had much to do with the introduction of triple-expansion engines into the vessels of the U. S. navy. He designed engines for the cruisers Yorktown, Concord, Bennington, Philadelphia, Newark, and Vesuvius, and for several well-known yachts and important merchant vessels. The cylindrical face-plate, if it may be so called, has been one of those by which it has been possible to produce perfect surfaces in main bearings and crank-shaft journals, so that heating, heretofore considered a natural consequence following the trial of a new engine, has been eliminated. He has been president of the American Society of Mechanical Engineers; is fellow of the American Association for the Advancement of Science; and a member of the British Institution of Naval Architects, and of other societies.

Seed-lac: See LAC.

Seeds [O. Eng. *sēd*; Germ. *saat*; Icel. *sāð*; Goth. *-seps* in *manasēps*, seed of men, the world; cf. Lat. *se'rere*, *sa'tum*, sow, Gr. *la'rei*, throw; Indo-Europ. root *sē-*, throw]: the immediate result of sexual propagation in phanerogamous plants, being the ovules after fertilization and the consequent formation of the embryo, which is the germ of a new individual. A seed consists of the embryo; of the matured coats of the OVULE (*q. v.*), commonly two, of which the outer, and generally the firmer, is technically called the *testa*, the inner, *tegmen*; and often of a stock of nourishing matter accumulated around or accompanying the embryo. The latter was named *albumen*, from a mainly fanciful analogy; the seed being likened to an egg, the albumen was supposed to answer to its white (albumen) and the embryo to its yolk. Seeds, such as those of peas, beans, and almonds, which have no albumen—that is, no stock of nourishment outside of the embryo—have always a strong and well-developed embryo, abundantly supplied with the same or similar matter stored in its own tissues. The general structure of the seed depending upon that of the ovule, the same terms are mostly applicable to it and to its modifications and parts (such as *anatropous*, *orthotropous*, *rhaphe*, *chalaza*, etc.); but the closed orifice through which impregnation was effected is called the *micropyle*; the scar left by separation from the seed-stalk or placenta is the *hilum*; the accessory and usually partial external covering, which is sometimes developed by a growth from the micropyle or the apex of the seed-stalk, is an *arillus* or *aril*. The mace of nutmeg and the pulpy covering of *Euonymus* seeds are familiar examples. A *caruncle* and a *strophiole* are nearly similar appendages at the base or hilum, not developed into a covering. Other appendages to certain seeds are the *coma*, or tuft of downy hairs at the summit, as in milkweed, or the base, as in willow, also the wing, as in trumpet-creeper; these and various other appendages aid in the dispersion of seeds. The albumen of the seed, when distinctively present, may differ greatly in abundance, consistence, and nature; as from farinaceous or flowery in wheat to cartilaginous or horny as in coffee, or to the texture and appearance of ivory in the vegetable-ivory nuts. In many cases, as in those just referred to, it forms much the larger part of the kernel of the seed; in others the embryo is so minute as to be with difficulty discerned antecedent to germination; while sometimes the embryo is the more conspicuous, and the albumen is reduced to a thin layer. When copious, the albumen generally envelops the embryo, but sometimes the latter enfolds the former, as in mallows, or is coiled around it, as in four-o'clock and chickweeds. The embryo and its parts are described in other articles. (See GERMINATION, COTYLEDON, and EMBRYOLOGY.) Its most important structural characteristic is the number of cotyledons or seed-leaves—one in monocotyledonous or endogenous plants; two in the dicotyledonous or exogenous.

There are many conflicting accounts as to the duration of vitality in seeds. The story of grain found buried with Egyptian mummies having germinated after being exhumed is generally discredited. All recent attempts under proper observation and due precautions have failed. The appearance of plants new to the station upon the soil brought

to the surface from excavations can usually be otherwise explained when they appear to involve a high antiquity, although there is no doubt that buried seeds have germinated after a lapse of fifty or more years. The best-authenticated case, pointing to a much longer preservation of vitality under such conditions, is that of the growth of raspberry-seeds found in the abdominal portion of a skeleton exhumed from a Roman tomb near Dorchester, England; but it is one not beyond doubt and uncertainty. One or two series of experiments, conducted by the sowing of seeds of known age, and also by the annual sowing from a stock of a considerable variety of seeds of the same age, indicate a rapid extinction of vitality under ordinary conditions. Out of 325 species, representing 74 families of plants, only 94 kinds grew after 8 years, only 57 after 4 to 8 years, only 16 from 8 to 21 years, 5 from 25 to 27 years, 3 to 43 years. In ordinary cases, leguminous seeds have longest preserved germinating power, in some very well-authenticated instances up to seventy or perhaps a hundred years. Nearly uniform temperature, darkness, and either dryness or burial beyond atmospheric influences, most favor the prolongation of vitality. See also FOOD. Revised by CHARLES E. BESSEY.

See'land: the largest and most important of the Danish islands; between the Cattegat and the Baltic, and between the Sound which separates it from Sweden and the Great Belt which separates it from the island of Funen. Area, 2,718 sq. miles, or with neighboring islands administratively dependent, 2,909 sq. miles. The ground is low and undulating, dotted with small lakes and studded with forests of oak and beech, but nowhere rising more than 200 feet above the sea. The soil is very fertile and well cultivated. Pop. (1890) in the administrative limits, 722,000.

Revised by M. W. HARRINGTON.

Seeley, Sir JOHN ROBERT, M. A.: educator and author; b. in London, England, in 1834; graduated at Cambridge 1857; became fellow of Christ's College 1858; Professor of Latin in University College, London, 1863; succeeded Charles Kingsley as Professor of Modern History at Cambridge Oct. 9, 1869. Author of *Ecce Homo, or the Life and Work of Jesus Christ* (London, 1865), which rapidly passed through many editions and elicited many replies; *Roman Imperialism* (1869); *Lectures and Essays* (1870); and editor of *Livy, with Introduction, Historical Examination, and Notes* (1871); wrote *Life and Times of Stein* (8 vols., 1870); *Expansion of England* (1883); *Natural Religion* (1882); *A Short History of Napoleon I.* (1886); *Goethe Revised after Sixty Years* (1893); *Growth of British Policy* (1895). D. at Cambridge, Jan. 13, 1895. Revised by S. M. JACKSON.

Seelye, see'lee, JULIUS HAWLEY, S. T. D., LL. D.: educator; b. at Bethel, Conn., Sept. 14, 1824; graduated at Amherst College 1849; studied theology at the Auburn Seminary, and also in Germany; was pastor of the First Reformed Dutch church, Schenectady, N. Y., 1853-58, then became Professor of Mental and Moral Philosophy in Amherst College. In 1872 he visited India, where he spent three months, largely occupied in lecturing to educated and English-speaking Hindus on the truths of Christianity. Some of these lectures were published in Bombay (1873) by request of their auditors, and also at Boston (1874) under the title *The Way, the Truth, and the Life*. He also published a volume on *Christian Missions* (New York, 1875) an elementary text-book on *Duty* (1891), besides various sermons, addresses, and articles in quarterly reviews, and translated Schwegler's *History of Philosophy* (New York, 1856). He aided in the revision of Hickok's *Psychology* (1882). In 1874 he was elected to Congress by a spontaneous movement of the people of his district, and without having received a nomination from any political party. In 1876 he was elected president of Amherst College, retaining his professorship. He resigned both offices in 1890. D. at Amherst, Mass., May 12, 1895. Revised by G. P. FISHER.

Seelye, LAURENUS CLARK, D. D.: educator; brother of Julius H. Seelye; b. at Bethel, Conn., Sept. 20, 1837; graduated at Union College 1857; studied at Andover Theological Seminary 1857-59, at Berlin and Heidelberg Universities 1860-62; traveled in Europe, Egypt, and Palestine; was pastor of the North Congregational church at Springfield, Mass., 1863-65; was Professor of English Literature and Oratory at Amherst College 1865-74; organized and became in 1874 first president of Smith College for young women, at Northampton, Mass.; author of various contributions to reviews, including articles on collegiate education and on Celtic literature.

NEWMAN, ALFRED, (Brynard), Ph.D.; botanist; b. at  
Brynard, Vermont, Feb. 20, 1825; educated at the Vermont  
College, and at Cambridge, England, 1844-48; was natural-  
ist on the famous U. S. S. Albatross on an exploring expedi-  
tion around the world 1848-57, made three Arctic voyages,  
explored the Foul Islands and parts of South and North  
America, 1859-60; editor of *Hesperian* 1862-62, and of  
*Journal of Mining, Metall. and Foreign*, 1865-71; pub-  
lished a *Nomenclature of the Geology of the Herald* (1874);  
*Geological History of Texas* (1875); *The History of the Geol-  
ogy of the Herald* (1877); *Flora Victoria* (1880); and other  
works; the world. U. of the Savan river, Nicaragua Oct. 10,  
1871.  
Died by CHARLES E. BRISTOL.

**Max Lohm**, born in Gießen, Hesse. Orientalist and traveler; born January 27th, 1839, Gießen, Germany, Jan. 30, 1897; was educated at the University of Göttingen; became a friend of Humboldt and Humboldt, under the patronage of the Prince of Saxony-Coburg undertook an extensive exploration in Mountainous Africa and Asia; first in Central Africa, in 1860, visited Arabia fifteen months at Aleppo (1862-64); traveled subsequently, made various scientific excavations in Asia and Palestine, especially in the Lebanon and the region E. of the Dead Sea (1864-69); in Egypt made a most extensive collection of MSS. and other objects for the Museum of Berlin, and explored Upper Egypt (1867-68); published numerous works; a papyrus called *Mexia* and *Medina* (1869); visited Mecca, where his last letter was written on Nov. 12, 1896; residing now in Mecca (1811); his property was seized under accusation that he was a magician. Nothing known of his subsequent history, but he is believed to have been executed (1811) by command of the Sultan of Morocco. His diary and maps preserved in 1845, was published at Berlin 4 vols. 1854-55. E. A. G.

Wagner's Wheel, See HANSEN'S MILL.

**Segovia**, capital of the province of Segovia, Spain: on the eastern, at the foot of the Sierra de Guadarrama; 32 miles S. E. W. of Madrid; see map of Spain, vol. 14. It is surrounded by old walls were crested by round towers. The towers are broken and cracked, but many of its buildings are magnificent. The aqueduct which carries the waters of the Rio Pisuerto into the city is 232½ feet long and carries 170 arches, some of which are 132 feet high. It is made of greenish blocks without cement or mortar, and is the greatest specimen of Roman architecture in Spain. The cathedral is a fine specimen of Gothic architecture. There are some manufactures of cloth, paper, and pottery. Pop. 1879, 44,000. The province of Segovia is part of Old Castile, and most of it is plateau; area, 2,714 sq. miles; pop. 1879, 154,441.

Albuquerque, N. Mex. : town ; capital of New Mexico, U. S. ; on the Rio Grande river, and the N. Pac. Railroad, 25 miles from Santa Fe. Known for its artesian wells, its climate of Texas, etc. 5-11. It is an agricultural and business region, and contains a university, a private bank, and three weekly newspapers.

Regulus, regium. Fr. prop. dectian. *Flourens, M. D.*  
 born at Chateau, Nîmes, France, Jan. 30, 1812;  
 educated at the colleges of Aix-la-Chapelle and St. Louis in Paris;  
 studied medicine and surgery under Boer, and was subse-  
 quently associated with Esquirol; undertook, soon after  
 leaving his medical degree, the training of a few blind chil-  
 dren, and occupied himself with great assiduity in the study of  
 comparative anatomy and zoölogy, in at length comprehended the  
 nature of these different faculties so completely that he was able to produce  
 some fine results for his system. In the first report  
 of Esquirol was presented with him, and their services  
 were together on the altitudes of his first pupil on  
 the subject of education in 1839. In 1844 a commission  
 of the Academy of Sciences of Paris directed that up to  
 the year 1850 he leave his laboratory (1850) which could not  
 be considered as suited by any means previously known or  
 indicated but that he had solved the problem. He pub-  
 lished in 1848 *Recherches sur les Hygiène et l'Éducation des  
 enfants de la classe des Parents pauvres*. After the Revolution  
 of 1848 he was appointed to the U. S. visited the school

for defective children in South Boston and the institution for feeble-minded youth at Harro, Mass., both in large measure the responsibility of his labors in Paris, when in Alliance, where Dr. Willenz was just organizing the experimental school which has estimated value in the New York State Idiot Asylum at Syosset, and considered him a valuable assistance in that organization; in 1881 settled in Portsmouth, N. H., in the practice of his profession. In 1884-85, he was at Syracuse teaching and testing idiot children, making 14,000 establishments of new institutions in Connecticut, Ohio, and Pennsylvania, and for a time was at the head of the Pennsylvania institution. In 1889 he settled in practice at Mt. Vernon, N. Y., whence he removed to New York in 1894. In 1870 he established in New York the Seguin Physiological School for feeble-minded children, which still exists. In 1891 he published *Idiocy, and its Treatment by the Physiological Methods*. He was a contributor of the Vienna Exposition in 1873 from the branch of education. Among his published works are: *Leçons sur l'Éducation des enfants idiots* (Paris, 1884); *Théorie et Pratique de l'Éducation des Idiots* (2 parts, Paris, 1902); *Éducation et Rééducation des Idiots* (Paris, 1907); *Travaux publiés au Congrès des Enfants atteints d'Idiotie* (Paris, 1906); *P. R. Prouver, professeur d'Instruction des Sciences et Morale au Pensionat* (Paris, 1907); *Intellectual Nutrition: the Design and Program of the Treatment of Idiots* (translated by J. S. Nowlarsy, M. D., 1906); *Medical Thermometry and Human Temperatures* (1906). He was also inventor of the physiological thermometer. D. in New York Oct. 29, 1920.

Flavoured by S. O. Agnew & Co., Inc.

**Séguir, ad par :** a family of the French nobility, many of whose members have been prominent in war, literature, and politics. The most distinguished are: 1. Louis Catherine, Comte de Séguir; b. in Paris, Dec. 10, 1759; received a military education, and served in America under Rochambeau; was appointed in 1783 ambassador to St. Petersburg, where he passed the time of Catherine II. and was instrumental in negotiating a treaty between Russia and France in 1787; retired from the public service on the overthrow of the monarchy during the Reign of Terror, and devoted himself to literary work; was recalled to service by Napoleon, became a peer during the first Restoration. D. in Paris, Aug. 27, 1840. His principal works are *Œuvres de Catherine* (1788), originally written for the private state of Catherine II.; *Œuvres, Fables, Chansons de Yers* (1801); *Traité historique et politique de l'Europe de 1788-96* (1804); *Mémoires, ou Souvenirs et Anecdotes* (1850). His *Œuvres complètes* were published in 36 vols. in Paris (1834-39)—42. His son, PAUL POLIÉPHE, b. in Paris, Jan. 4, 1790; entered the army in 1799; became a member of the staff in 1812; governor of the imperial prisons in 1804; and brigadier-general and aide-de-camp to Napoleon during the Russian campaign; after the second Restoration he retired to private life. He was made a peer by Louis Philippe. In 1834 he published *Histoire de Napoléon et de la Grande Armée pendant l'Année 1817*, which made a great sensation, and has been often reprinted. He also wrote *Histoire de Rome* (1820) and *Histoire de Charles VIII.* (1844); translated into English, Philadelphia, 1842. D. in Paris, Feb. 25, 1877.

Soddl, (xpl'), AVROU H.: conductor; b. in Budapest, Hungary, May 8, 1859, and educated there, and at Leipzig and Bayreuth under Richter and Wagner. He assisted Wagner in making the first score of the *Nibelungen* tetralogy, and in 1870 was the chief stage-director at the first production of the *Nibelungen* drama at Bayreuth, and from that time till 1885 was well known in Europe as a Wagner conductor. From 1870 till 1882 he was conductor at the Leipzig opera-house. In 1885 he married the opera-singer Fridolin Kraus, and in September of that year was called to New York to conduct the German opera, embracing De Lapocchi, *Tramisch*. On the departure of Theodore Thomas for Chicago in 1891, Sodd was elected conductor of the Philharmonic Society. He is also a fine pianist, an accomplished *litterateur*, and a deep student of Shakespeare. He is a naturalized citizen of the U. S. D. F. HARVEY.

Sedlitz Ponders: the Potassium (Medical Use of Potassium Permanganate)

**Schulträger:** See COUNCILS

Selne, Fr., town, on the *Seyne* of Casars; a river of France, which runs in the department of Côte d'Or at an elevation of 1,545 feet above the level of the sea; flows in a

northwestern direction, passes through Paris, where it is from 400 to 600 feet wide, and enters the English Channel at Havre by an estuary 7 miles wide. Its entire length is 482 miles, of which about 350 below Troyes are navigable by barges, and 40 from Rouen to Havre (to which the term *Seine maritime* is applied) by vessels of 200 to 300 tons. It receives from the left the Yonne, the Essonne, and the Eure, and from the right the Aube, Marne, and Oise. By canals it communicates with the Loire, Saône, Rhine, Rhône, Meuse, and Scheldt. Though surpassed in some respects by the Loire, Saône, and Garonne, yet with the hills and valleys, forests and meadows, numerous villages, populous towns, and famous cities which line its banks it is one of the finest rivers in Europe.

**Seine:** department of France; completely inclosed within Seine-et-Oise; area, 185 sq. miles. It is the smallest but the most densely peopled and wealthiest department of France, comprising Paris and the suburban villages of Boulogne, Clichy, Puteaux, etc. The ground is undulating and traversed by the Seine and the Marne. The soil is not naturally fertile, but it has been made very productive by the skill of the farmers and gardeners. Immense quantities of vegetables, mushrooms, melons, peaches, and strawberries are raised for the markets of Paris. Beautiful forests, as those of Boulogne, Vincennes, St.-Cloud, and Meudon, cover a large part of the surface between the cities, and rich quarries of building-stone and gypsum are found. Pop. (1891) 3,141,595.

**Seine-et-Marne, -ā-maarn':** department of France, adjoining Seine-et-Oise on the W.; area, 2,214 sq. miles. The ground is slightly undulating and the soil very fertile. Extensive forests, yielding excellent timber, are found, among which is that of Fontainebleau. Large crops of wheat, vegetables, and fruits are raised; the wine of the department is mediocre, though it produces one of the most celebrated kinds of table-grapes, the Chasselas de Fontainebleau. On the pastures and meadows numerous cattle are reared, and immense quantities of cheese, the so-called *fromage de Brie*, are sent to the Paris markets. The manufacturing industry of the department is not of great importance. Pop. (1891) 356,709. Capital, Melun.

**Seine-et-Oise, -ā-waaz':** department of France. Area, 2,163 sq. miles. In the southern part the ground is almost flat; in the northern, hilly and covered with forests. The soil is generally not fertile, but, being well manured and excellently cultivated, yields large crops of fruits and vegetables for the capital. Different branches of manufactures are pursued with great success. Several fine varieties of stone and clay are found, and the porcelain manufactures of Sévres have acquired a worldwide reputation. Pop. (1891) 628,590. Capital, Versailles.

**Seine-Inférieure, -ān'fā-ri-ōr':** department of France, bordering on the English Channel. Area, 2,330 sq. miles. The ground is generally composed of plains, watered by numerous small streams, and broken only in the southwestern part by ranges of low hills. The soil is fertile and well-cultivated. Forests abound; large crops of grain, hemp, flax, hops, and fruits are raised, and sheep, cattle, and horses are extensively reared. Manufactures, and especially fisheries and commerce, form important sources of wealth. Large quantities of cheese, butter, and cider are made. Poultry, chickens, turkeys, ducks, and geese are raised, and enormous quantities of eggs are exported to England. Pop. (1891) 839,876. Capital, Rouen.

**Seines:** See FISHERIES.

**Seip, sip, THEODORE LORENZO, D. D.:** educator; b. at Easton, Pa., June 25, 1842; graduated at Pennsylvania College, Gettysburg, Pa., and Theological Seminary, Philadelphia. He has been connected with Muhlenberg College, Allentown, Pa., since its organization in 1867, first as principal of the academic department, and successively as Professor of the Latin and Greek Languages, becoming president in 1886. H. E. J.

**Sei'sin** [from O. Fr. *seisine, saisine*, deriv. of *seisir, saisir*, seize Ital. *sagire*; of Teuton. origin; cf. O. H. Germ. *sazjan*, set]; in law, possession of a freehold estate. The term originally signified any possession, whether of real or personal property, but it became appropriated at an early period to describe the possession of a freehold tenant of lands. If such freeholder surrenders the actual physical possession to another who lays no claim to the freehold (as a tenant for years), he does not thereby lose his *seisin*.

The tenant's possession is referred to the landlord's *seisin*, and constitutes a part of it. (See PROPERTY.) But if actual possession of the land be taken, rightfully or wrongfully, by one who intends thereby to hold the freehold, the act is a *disseisin* of the owner and operates to transfer the freehold to the "disseisor." (For this extraordinary consequence of a *disseisin*, see LIMITATION OF ACTIONS.) In the same way every one who has a vested future estate of freehold, whether in reversion or remainder, is seized of such estate so long as the present or particular estate upon which the future estate is limited continues to be vested in possession. If the particular tenant is disseised, however, every future estate which depends upon his estate is divested by the same act. See LANDLORD AND TENANT and REMAINDER.

The expression "livery of *seisin*," which described the ancient process of conveyance of freehold interests, known as *feoffment*, is only the archaic equivalent for the phrase delivery of possession. See FEOFFMENT, FREEHOLD, and GRANT. GEORGE W. KIRCHWEY.

**Seis'mograph:** an instrument recording graphically the motions of a point on the earth's surface during an earthquake. Instruments for the automatic record of earthquakes are classed according to special function—as (1) seismoscopes, which merely detect and record the fact of an earth tremor, with or without indication of its time; (2) seismometers, which measure also the maximum force of the shock, either with or without indication of its direction; and (3) seismographs, which record the number, succession, direction, amplitude, and period of successive oscillations. Most seismoscopes are devices involving a delicately adjusted trigger whose small movement permits a weight to fall, causes an alarm to sound, or stops a clock. In seismometers a heavy liquid is agitated or made to spill from a vessel, or a movable solid is thrown down or displaced. In the construction of seismographs the primary endeavor is to give astatic suspension to a heavy body, that is, to suspend it in such way that when its position is disturbed through a small distance no force will be developed tending to restore its original position; or what is the same thing, so that if its support be moved the motion will not be communicated to the body. This ideal result has never been accomplished, but close approximations have been obtained by various devices. The complementary part of the apparatus consists in systems of levers, etc., connecting the body astatically suspended with various fixed points, or surfaces moved by clockwork, in such way as to secure a graphic record of the relative motions in various directions. The more elaborate machines record motion in the vertical direction and in two horizontal directions. See EARTHQUAKES, and consult the *Transactions* of the Seismological Society of Japan. G. K. GILBERT.

**Seismology** [Gr. *σεισμός*, earthquake + *λόγος*, discourse, reason]: See EARTHQUAKES.

**Seismometer and Seismoscope:** See SEISMOGRAPH.

**Seiss, sees, JOSEPH AUGUSTUS, D. D., LL. D., L. H. D.:** author and preacher; b. near Emmitsburg, Md., Mar. 18, 1823; student in Pennsylvania College, Gettysburg, Pa.; ordained to the Lutheran ministry 1844; pastor in Virginia 1842-47, Cumberland, Md., 1847-52, Baltimore 1852-54, Philadelphia since 1858. He is a preacher of extraordinary power. His literary career began with *Lectures on the Epistles to the Hebrews* (1846), and has continued until his books and pamphlets number considerably over 100. His *Gospel in Leviticus* was republished in England, and his *Lectures on the Apocalypse* has been translated and published in Germany and Holland. He has been editor of *The Prophetic Times* and *The Lutheran*. He is one of the founders of the General Council, of which, as well as of the ministerium of Pennsylvania, he has been president. He has been president also of the board of trustees of the Philadelphia Seminary almost ever since its foundation, and a member of the committee that prepared *The Church Book* and *The Common Service*. H. E. JACOBS.

**Seistan, sās-tawn', or Sistan:** district divided between Persia and Afghanistan, Central Asia; between lat. 30° and 32° N. and lon. 60° and 62° E., bordering W. on the Persian provinces of Khorassan and Kirman. The surface forms an extensive depression, toward which the surrounding table-lands slope gently. The soil consists either of quicksand or of a stiff clay covered with coarse grass and tamarisk-bushes, and uncultivable except along the rivers, which from the surrounding highlands gather in the middle of the

on them, but with hydrochloric acid they evolve chlorine, forming selenious acid and chlorides.

Revised by IRA REMSEN.

**Selenious Oxide:** the only oxide of selenium known. It is a solid white substance obtained by combustion of selenium in oxygen, or by evaporating selenious acid to dryness. Its formula is  $\text{SeO}_2$ . It sublimes, without fusing, below redness, condensing in crystals, and is very deliquescent. Its compound with water, selenious acid ( $\text{H}_2\text{SeO}_3$ ), is a strong acid, which decomposes, with heat, the chlorides and nitrates, and forms neutral salts with bases, being exceptional, nevertheless, in being decomposed by heat, as above intimated. The selenites are bibasic, and large numbers have been prepared and investigated, but for these the chemical text-books must be referred to.

**Selenite** [from Lat. *selenites* = Gr. *σεληνίτης* (sc. λίθος, stone), deriv. of *σελήνη*, moon. So called from its luster]: a mineralogical name for gypsum. Dana believes that the *σεληνίτης* of Dioscorides was probably really crystallized gypsum, but not the *selenitis* of Pliny. Discoveries in molecular structure indicate two distinct varieties of the species selenite or gypsum—allotropic modifications, as they may be called—one having density, when homogeneous, = 2.818 (Mohs found 2.81, and Kennigott, as the mean of 15, found 2.817), and the other = 2.837 (Fihol found 2.831).

**Selenium** [Mod. Lat., from Gr. *σελήνη*, moon. So called from its chemical analogy to *tellurium* (from Lat. *tellus*, earth), being as it were a companion to it]: a chemical element discovered by Berzelius in 1817. Sulphur, selenium, tellurium, and oxygen form Berzelius's natural amphigen group of elements, which are certainly separated widely from the halogen group in many respects, though fluorine apparently forms a connecting link, having many affiliations with both groups. Selenium must be considered one of the rarer elements, though several native mineral compounds of it are known. The mineral *clausenthalite* is selenide of lead, *zorgite* a double selenide of lead and copper, these being the principal sources of commercial selenium, and somewhat common in the mines of the Hartz Mountains, at Tilkerode, Clausthal, and Zorge, also at Glasbach in Thuringia. *Lehrbachite* is a selenide of lead and mercury from the Hartz; *berzelianite*, a selenide of copper from the same, and from Skrikerum in Småland, Sweden; *eucairite*, a copper and silver selenide, also from Skrikerum, and found in several Chilean localities; *naumannite*, a silver-lead selenide from the Hartz. There is a silver selenide in crystals at Tasco in Mexico (del Rio); *tiemannite*, a mercuric selenide, from the Hartz; and a few others less known. Certain iron pyrites, as at Fahlun in Sweden, contain selenium; and when these are used for making sulphuric acid, a seleniferous deposit forms in the leaden chambers, in which, indeed, the element was first discovered by Berzelius. Selenium is obtained principally from the dust that accumulates in the flues of sulphuric-acid works, and of roasting-furnaces where iron pyrites containing selenium are used. The relative quantity of selenium in the pyrites is very small, but the product of its combustion is a solid that is much less volatile than the gases given off in the burning of the pyrites, so that this product accumulates in the flues. In order to obtain the selenium from the dust, this is treated with an oxidizing agent, either nitric acid or a nitrate, and the selenium thus all converted into the dioxide,  $\text{SeO}_2$ , or into a salt of selenic acid,  $\text{H}_2\text{SeO}_4$ . Both of these oxides are easily reduced by sulphurous acid, the element selenium being precipitated.

There are at least two modifications of selenium which correspond to those of SULPHUR (*q. v.*). One is slightly soluble in carbon disulphide, the other is not. The soluble form is obtained by reducing selenious acid by means of sulphurous acid, or other reducing agent. The insoluble variety is obtained by melting selenium and rapidly cooling it. The soluble form is crystalline, the insoluble form is amorphous.

Selenium does not kindle easily, like sulphur, but when heated strongly will burn in the air; and selenides will burn before the blowpipe. A characteristic odor accompanies this combustion, compared by some to that of horse-radish, by which the presence of selenium in a mineral can be detected by those who know the odor.

**Compounds.**—Seleniatted hydrogen, corresponding to sulphuretted hydrogen, is one of the most interesting of these. It is a permanent gas, which may be formed by the action of an acid on selenide of potassium, or by heating selenium in a current of dry hydrogen to its vaporizing-point. At a

higher temperature dissociation again occurs. It is very poisonous, producing catarrhal disease when inhaled, and destroying the sense of smell. It does not liquefy at  $-15^\circ \text{C}$ .

The electrical conductivity of selenium is influenced to a remarkable degree by heat and light. Amorphous selenium does not conduct electricity, but the crystallized does so, and the conductivity increases rapidly with a rise in temperature. According to the latest investigations, however, amorphous selenium conducts electricity when heated to  $165^\circ$  or  $175^\circ \text{C}$ , and higher.

Revised by IRA REMSEN.

**Seleucia**, sel-yoo'see-aa, or **Seleucia** (Gr. *Σελεύκεια*) sel-yoo-see-aa: the name of several cities founded mostly by Seleucus I., Nicator. 1. A city on the Tigris. In the time of Titus it had a population of 600,000; it was partially burned in 116 A. D. by Trajan, and was destroyed in 162 A. D. by L. Verus.—2. SELEUCIA PIERIA in Syria, near the mouth of the Orontes.—3. SELEUCIA on the river Belus in Syria.—4. SELEUCIA in Northern Palestine.—5. SELEUCIA SIDERA discovered by G. Hirschfeld in the plain of Isparta in Pisidia.—6. SELEUCIA in Pamphylia near the mouth of the Eurymedon.—7. SELEUCIA on the Calycadnus in Cilicia Tracheia, the scene of the drowning of Barbarossa. J. R. S. STERRETT.

**Seleucidae:** one of the five great dynasties of ancient Persia before the Mohammedan conquest. After the death of Alexander the Great (b. c. 323) the vast empire, including Iran, that had been brought under his command, fell apart, and Syria became one of the recognized ruling powers under Seleucus Nicator (ruled b. c. 312–281), who had been one of Alexander's generals. This vigorous commander became the founder of the kingdom of the Seleucidae. He was succeeded by his son Antiochus I., Soter (b. c. 280–261), and the latter in his turn by a son, Antiochus II., Theos (b. c. 261–246). Under the first Seleucids the Greek sovereignty over Persia was preserved intact for nearly seventy years; its unity, however, was broken about b. c. 256 by the revolt of Bactria, and in b. c. 250 by the rebellion and rise of Parthia as an independent power under Arsaces. The Seleucid supremacy itself may be said to have ceased in Iran about b. c. 150, at the time of the Parthian monarch Mithradates the Great. It had lasted less than two centuries, and as a factor in Persian political history its existence was even less than a hundred years in duration. A. V. WILLIAMS JACKSON.

**Seleucus** (in Gr. *Σελεύκος*): the name of several rulers of antiquity. 1. SELEUCUS I., Nicator, one of the generals of Alexander the Great, b. in 365 B. C. In 321 B. C. he became governor of Babylonia and in 317 of Susiana. He was forced by Antigonus in 315 to flee to Ptolemy in Egypt. In 312 he was victorious over Antigonus and regained control of Babylonia, Susiana, and Media. This year (312 B. C.) was the beginning of the Seleucid era. Henceforth his arms were uniformly successful, and he advanced into India farther even than did Alexander, thus gaining the title of *Nicator*. He was the first of all the successors of Alexander to assume the title of king. In the battle of the kings at Ipsus in 301 he chiefly was instrumental in causing the defeat of Antigonus, and he thus added Armenia, Southern Asia Minor, and Syria to his kingdom. He then allied himself to Demetrius Poliorcetes, whose daughter Stratonice he married, but he soon became involved in a war with Demetrius, and, having taken him prisoner, held him in captivity until his death in 283. His war with Lysimachus ended in 282 with the addition of Asia Minor to his empire, which thus extended from the western seaboard of Asia Minor to India, and was divided into seventy-two satrapies. His aim, contrary to that of Alexander, was to Hellenize the Orient, and he was successful to a degree, but the removal of his capital from Seleucia on the Tigris to Antioch on the Orontes tended to estrange the two elements. In 281, in addition to the surrender of his wife Stratonice, he gave the whole of Asia to his son Antiochus, and himself undertook the conquest of Macedonia, but was murdered by Ptolemy Ceraunus in 281 B. C. before he could accomplish his object.—2. SELEUCUS II., CALLINICUS, the great-grandson of Seleucus I., reigned 246–226 B. C. He could not withstand Ptolemy Evergetes, King of Egypt, who to avenge the murder of his sister Berenice advanced victoriously against Seleucus as far as Susa, and in 239 added Palestine, Phoenicia, and Coele Syria to Egypt. Antiochus Hierax, the younger brother of Seleucus, declared himself King of Asia Minor, but was subdued. The Parthians then revolted, and in 238 were victorious over Seleucus, thus founding the Parthian kingdom. Attalus, too, sought for a slice of the crumbling empire, and in 226 defeated Seleucus, who in fleeing from the battle was

**Seligman, EDWIN ROBERT ANDERSON, LL. B., Ph. D.:** professor of political economy and finance; b. in New York, Apr. 25, 1861; graduated at Columbia College 1879; studied three years at the Universities of Berlin, Heidelberg, Geneva, and Paris; at Columbia College Law School and School of Political Science 1882-84; lecturer on Political Economy, Columbia College, 1885-87; adjunct professor 1887-90; Professor of Political Economy and Finance 1890; treasurer of the American Economic Association 1885-90; associate editor *Political Science Quarterly* since its establishment in 1886; author of *Railway Tariffs and the Interstate Commerce Law* (1887); *Two Chapters on the Medieval Guilds of England* (1887); *Finance Statistics of the American Commonwealths* (1889); *Taxation of Corporations* (1890); *On the Shifting and Incidence of Taxation* (1892).

C. H. THURBER.

**Se'lim:** the name of three Ottoman sultans. **SELIM I.,** Yavuz, the Inflexible (1512-21); b. 1467. By the aid of the janissaries he usurped the throne, deposing his father Bayezid II., whom he is believed to have poisoned shortly after. Then he put to death all his brothers and kinsmen. Attacking Persia he defeated Shah Ismail at Calderon with immense slaughter (1514) and annexed Kurdistan and Mesopotamia. Conquering Syria (1516), the title Servant of the Two Holy Cities (Mecca and Medina), hitherto reserved to the caliphs, was added to his name in the official prayer. He subdued Egypt (1517), hanging at the gate of Cairo the heroic Mameluke sultan Touman Bey. The sherif of Mecca sent him the keys of the Kaaba, and Mohammed XII., the last Abbasside caliph, resigned to him the insignia and the rights of the caliphate. Since then the Ottoman sultan has been considered both political and spiritual head of Islam. The next three years he devoted to reorganization of his empire. Excessive use of opium hastened his end, and he died at Tchörli (1521), the very place where eight years before he had fought against his father. A gifted poet, profound scholar, farsighted statesman, and resistless conqueror, he was bloodthirsty and cruel beyond expression. He is the only parricide among the Ottoman sultans.—**SELIM II.,** MEST, the Drunkard (1566-74); b. 1524; son of Suleiman II., and Roxelana. His generals subdued Western Arabia (1567) and Cyprus (1571), but lost the naval battle of Lepanto (1571), where 220 Ottoman ships were sunk or captured, 30,000 prisoners taken, and 15,000 Christian galley-slaves set free. Meanwhile Selim cared only for intoxication and the pleasures of the harem, and died from over-indulgence in wine (1574).—**SELIM III.,** (1789-1807); b. 1761; son of Mustapha III.; succeeded his uncle Abd-ul Hamid I. At his accession the empire seemed near dissolution. Syria was in rebellion; Egypt was tyrannized over by the Mamelukes; the Persians and Kurds menaced the eastern frontier; armies of brigands marched through the provinces; a hopeless war against Russia and Austria was going on. Selim was the first sultan animated by Western ideas. Ridding himself of the foreign war by the disastrous treaty of Jassy (1792), he endeavored to repress disorder and introduce administrative, commercial, and military reforms. But popular fanaticism denounced his innovations as violations of the Koran. The support he received from France through the French ambassador, Gen. Sebastiani, excited the jealousy of Great Britain. A British fleet appeared before Constantinople, but was repelled. Finally the janissaries and the Mussulman clergy combined; Selim was deposed and confined in the seraglio and his cousin Mustapha IV. raised to the throne (1807). The following year Balractor Pasha, his devoted adherent, marched upon Constantinople with a formidable army. Thereupon Mustapha had Selim bowstrung, and Balractor penetrated the palace in triumph, only to find the corpse of his master in the throne-room. E. A. GROSVENOR.

**Selimnia or Islimiye:** See SLIVNO.

**Sellinsgrove:** borough; Snyder co., Pa.; on the Susquehanna river, and the Penn. Railroad; 50 miles N. of Harrisburg, the State capital (for location, see map of Pennsylvania,

ref. 4-F). It has good water-power; is in an agricultural region; contains a national bank with capital of \$50,000; a monthly and two weekly newspapers, several sawmills and planing-mills, and sash-factories; and is the principal outlet for the produce of the county. The Missionary Institute of the Evangelical Lutheran Church (chartered in 1858) is located here. Pop. (1880) 1,431; (1890) 1,307.

**Sellinus** (Gr. *Σελίνους*): ancient city; on the southwest coast of Sicily; was founded in the seventh century B.C. by a Megarian colony, and derived its name from the quantity of wild parsley (*σέλινον*) which grew in the vicinity. A strong and flourishing city, it was almost ruined by the Carthaginians under Hannibal Gisgo, when 16,000 of its inhabitants were massacred and 5,000 made slaves (409 B.C. and was entirely destroyed during the first Punic war (264-241 B.C.). Its ruined temples served as a refuge to the early Christians, but it was never rebuilt. These temples are the vastest in Europe. The last-built and largest, measuring 369 feet by 178 feet, with seventeen columns on each side and double porticoes, was erected toward the middle of the fifth century B.C., and consecrated to Apollo. Its finest sculptures have been removed to the Museum of Palermo. See Benndorf, *Die Metopen von Selinunt* (Berlin, 1873); and Baedeker, *Southern Italy and Sicily*.

E. A. GROSVENOR.

**Seljuks, sel-jooks':** a Turkish tribe which, being driven from the highlands of Turkestan, settled in the plains of the E. of the Caspian Sea. There they were converted to Islam. They were famous for strength and courage, and the Caliph Motassem (833-842), chose his body-guard from among them. Under the leadership of their chief Seljuk—whence the tribe derives its name—these guards revolted, seized the temporal power, and founded an independent state in Khorassan, though all the time acknowledging the spiritual supremacy of their former masters. Togrul Beg, grandson of Seljuk, conquered Balkh and Khauran (Khiva) in 1041, Irak Adjemi (1043), Kerman and Fars (1047), Bagdad (1055), and Irak Arabi and Mosul (1062). Having thus completed the subjugation of Persia, he assumed the title of sultan. The extent and prosperity of the empire largely increased under his nephew Alp-Arslan (1063-73), the conqueror of the Byzantine emperor Romanus Diogenes, and under Malek Shah (1073-93), the son of Alp-Arslan. Malek Shah conquered Arabia, Syria, and Palestine, Armenia, and a large part of Asia Minor, ruling as far as the Chinese frontier and from the Caspian to the Arabian Sea. He founded at Bagdad a law school and an observatory, the first established in Asia, but removed the capital to Isphahan. He encouraged the construction of roads, bridges, canals, and works of public utility, being ably seconded in all his undertakings by his vizier, Nizam-ul-Mulk. The rapid growth of the power of the Seljuks was due to their religious ardor, to the skill and intrepidity of their early chiefs, and to their peculiar facility in assimilating not only their kindred of Turkish stock, but also subject races. Their decline dates from the division of their empire by Malek Shah into sultanates for his four sons, followed by other divisions. The sultanate of Iran was the chief, and was to exercise a sort of authority over the others. It was swallowed up by the sultanate of Khauran (1194), which in turn was overthrown by the Mongols (1221), when the last sovereign Ala-Eddin and his gallant son Djial-Eddin were utterly defeated by Genghis Khan. The sultanate of Aleppo fell in 1114, that of Damascus in 1155, and of Kerman in 1191. The sultanate of Iconium comprised nearly all Asia Minor, and lasted till 1299, when Ala-Eddin III., having fled from the Mongols, died at Constantinople. From its ruins arose ten principalities, one of which under the Emir Othman was in time to subdue all the rest and to develop into the Ottoman empire. The Seljuks of Iconium and Iran were the Mussulmans earliest and most frequently encountered by the hosts of the first and second crusades, and were their most formidable antagonists. E. A. G.

**Sel'kirk:** a county of Scotland, anciently called Ettrick Forest; bounded by the counties of Peebles, Edinburgh, Roxburgh, and Dumfries; area, 257 sq. miles; pop. (1890) 27,712. Its surface is composed principally of rolling grassy hills, the highest of which is Dun Rig (2,433 feet), and it is chiefly devoted to cattle-raising. Selkirk was the birthplace of James Hogg, the "Ettrick Shepherd"; and of Mungo Park, the traveler; and it is noted in both literature and history. With Peeblesshire it sends one member to Parliament. The royal burgh of Selkirk, 39 miles S.W.

**Semipalatinsk'**: Russian province and town of Central Asia. The province is on the upper Irtysh river, between Siberia and Lake Balkash. Area, 184,631 sq. miles. It is of triangular form, with the apex directed N. A range of mountains and hills which runs E. and W. through its middle separates the great steppe of the Irtysh on the N. from the steppe of Balkash on the S. Pop. (1890) 576,578, four-fifths of whom are Kirghiz, who are generally nomadic. The remainder are nomadic Kalmuks and sedentary Russians, Sarts, and others. The chief town is Semipalatinsk, on the right bank of the Irtysh, in lat. 50° 24' N. (see map of Asia, ref. 8-E). Although of administrative importance, it is a cheaply built and decaying town, surrounded by the bare steppe, and in constant danger from moving dunes. The climate is rigorous, and industry and traffic are small. Pop. 18,000.

MARK W. HARRINGTON.

**Semi-Pelagianism**: See ANTHROPOLOGY (*Theological*).

**Semiramis**: according to Ctesias, the wife of Ninus, founder of the Assyrian kingdom,—a woman of extraordinary beauty, passion, and military prowess who flourished nearly 2,200 years B. C., survived and eclipsed her husband, and after a reign of forty-two years abdicated in favor of her son, Ninyas. All this is admitted to be mythical. Herodotus (*Hist.*, i., 184) mentions a Semiramis who ruled over Babylon five generations before Nitocris. This Semiramis of Herodotus is certainly not to be identified with the Semiramis of Ctesias. The name appears to have been derived from Sammuramat, found upon the monuments, wife of the Assyrian king Rammanirari III. (811–782 B. C.).

**Semirechensk'**: Russian province of Central Asia; S. of Lake Balkash, and bounded on the S. and E. by Chinese territory; area, 152,280 sq. miles. The province is oval in form, with the long axis N. and S. It falls into two natural divisions, the northern plain and the southern and western mountainous region. The plain is the country of the "seven rivers" (Russian, *Semiretchie*), all tributaries of Lake Balkash. This part is dry, largely sandy, in some places a sandy desert, grows strongly alkaline toward the lake, and has a rigorous climate. The mountainous region includes a part of the Thian-shan range and many lakes, the largest being Issykul; has more rain, a milder climate, and considerable forest growth. Production and trade are very small. Pop. (1889) 671,878, largely Kirghiz, the remainder of many races, fully half nomadic.

MARK W. HARRINGTON.

**Semitic Languages** [*Semitic* (i. e. pertaining to Shem or his descendants) is based on the Greek transliteration (Σήμ) of Heb. *Shēm*, which literally means name, sign, celebrity]: a well-defined group of languages co-ordinate in importance with the group known as the Aryan or Indo-European, but sharply marked off from it. The principal representatives of the Semitic group are, in alphabetical arrangement, Arabic, Aramaic, Babylonian, Ethiopic, Hebrew, Phœnician, and Syriac. The name Semitic is an inexact term. It rests on the assumption that the nations classed in the tenth chapter of Genesis among the sons of Shem spoke languages belonging to a single group, and embraced also all the members of that group. Neither proposition is correct. The principle governing the order of enumeration in the famous table of nations is geographical position, and not linguistic affinity. Instead of Semitic, various terms have been proposed, the most satisfactory among them being Syro-Arabic, first suggested by Renan.

The basis of union between the languages belonging to the Semitic group is such that they form intersections of one and the same branch, in contradistinction to the Aryan languages, where two distinct branches emanating from the parent trunk are recognized; and, again, a subdivision into north and south is sufficient for the Semitic group, while in the case of the Aryan eight grand divisions are commonly recognized. The relation of any North Semitic language to a member of a South Semitic is closer than that between members (say) of the Indo-Iranian and the Teutonic division, and almost as close as that marking (say) the English and German within the Teutonic division. Correspondingly, within the Northern and Southern Semitic divisions the members stand in a relation toward one another closely approaching that of co-ordinate dialects.

The intimate relationship thus indicated between the languages of the Semitic group is due to a variety of causes, prominent among which are (1) the comparatively limited territory over which the languages are spread; (2) the uninterrupted communication in consequence largely of this limited territory among the nations speaking or adopting a

Semitic language; and (3) the closer ethnic relationship of the Semitic nations, only two races being distinguished by scholars, as against five adopted for the Aryan group.

The chief traits characterizing the Semitic languages are—(1) the peculiar relations existing between the consonants and vowels whereby the former constitute the essential elements of a stem and of its accretions, while the latter play the subsidiary though important rôle of particularizing the general meaning conveyed by the consonantal framework. (2) The triliteral character, either actual or adapted, of the stems within the historical period of the language. The comparatively small number of instances in which the number of consonants constituting the stem are four, and still more rarely five, are only apparent exceptions to the rule. (3) The arrested development in the expression of the time-relations in the case of the verb, which, starting out with the vague differentiation by means of pronominal affixes between the emphasis placed on the act and when placed on the actor, does not pass beyond the stage of distinguishing between the act when completed, whether in reality or in the mind of the speaker, and when not similarly completed. (4) The pragmatic character of the verbal and nominal formations and the parallel relationship existing between the two. The Semitic stem as such has both substantive and verbal force, and while the actual number of modal variations differs for the different languages of the group, the manner of expressing the variations, (a) by means of the reduplication of the second or third letter of the stem, (b) by vocalic lengthening after the first consonant or by a vocalic prefix, (c) by the prefixing of certain consonants *n*, *h*, *sh*, *t*, is the same in all; and not only does the noun-formation follow the same principles, but the agreement with the verb is such as to indicate the ultimate fusion of the two. (5) The paucity of auxiliary particles, more particularly of conjunctions.

Besides these general traits, there are a number of other features of a secondary order which the Semitic languages have in common. Thus, the general agreement of the vocabulary is very large, embracing a considerable number of common words, the pronouns in the first instance and terms of relationship in the second, as well as verbal stems. But within the Semitic group the agreement is closer between some as against others. The general character of the Semitic syntax is marked by its simplicity, and there is less variation between the languages in this respect than one would perhaps expect until we come to the period of a closer contact between Indo-Europeans and Semites.

Perhaps the most noticeable point of variation among the Semitic languages is to be found in the writing employed. They present at least three distinct alphabets: (a) The cuneiform characters of Babylonia and Assyria; (b) the Phœnician and its derivatives, the square-letter Hebrew, Palmyrene, Arabic, Syriac, Samaritan, together with the alphabet of the South Arabic and Abyssinian inscriptions as the probable prototype of the Phœnician; and (c) the Ethiopic, which is sufficiently distinct to merit a place for itself.

On the basis of the features enumerated the division into North and South Semitic languages is made. To the former belong the Phœnician, Hebrew, Moabitic, Babylono-Assyrian, and the various Aramaic dialects, biblical Aramaic, Palmyrene, Nabatean, the idioms of the Babylonian and of the Palestinian Talmuds, Samaritan, the North Arabic and ancient Syrian inscriptions, Syriac—Eastern and Western—Mandaic, and the modern Syriac dialects of Urmia, Tur Abdin, Salames, and of the Lebanon district. To the Southern division belong (1) classical Arabic, and the modern dialects of Egypt, Syria, and Morocco, with Maltese as a fourth, developed under Italian influence; (2) Sabæan, also known, though less correctly, as Himyaritic, of which Minæan is a dialect, and which appears to survive in some dialects spoken along the southern coast of Arabia; (3) Ethiopic or Ge'ez, spoken in the ancient kingdom of Abyssinia, and surviving in the modern dialects of Tigre, Tigrina, and Amharic, together with its offshoots, Gurague and Harar.

By way of simplification the North Semitic group can be said to comprise (1) Hebræo-Phœnician, (2) Babylono-Assyrian, and (3) Aramaic; and the South Semitic (1) Arabic, and (2) Yemenitic-Abyssinian. Taking these up in turn, the Hebrew and Phœnician bear so close a resemblance to one another that they may be regarded as co-ordinate offshoots of some older and lost form. Of the two, the Phœnician on the whole presents the more archaic aspect. Of literature in the true sense nothing has survived in the original Phœnician. Instead there are inscriptions on tombs, tem-

languages, a connection so close as to warrant the assumption of a common origin for the two, Egyptian itself being the result of a combination of a Semitic substratum with Hamitic elements. There is nothing improbable in the supposition of an eastern migration of Semites into Arabia and the Euphrates valley, and then by further moves an entrance into Palestine and Syria. If, as seems probable, the origin of the so-called Phœnician alphabet, which is so peculiarly adapted to Semitic speech, is to be sought in Southern Arabia, an additional support for what may be called the African theory will be found. See LANGUAGE.

LITERATURE.—Ernest Renan, *Histoire des Langues Sémitiques* (5th ed. Paris, 1878); William Wright, *Comparative Grammar of the Semitic Languages* (Cambridge, 1890); Theodor Noeldeke, *Die Semitischen Sprachen* (Leipzig, 1887); J. Barth, *Die Nominalbildungen in den Semitischen Sprachen* (Leipzig, 1889-91).

MORRIS JASTROW, JR.

**Semler, JOHANN SALOMO**: theologian; b. at Saalfeld, Saxe-Meiningen, Dec. 18, 1725; studied theology at the University of Halle, where he was appointed professor in 1751, and director of the theological seminary in 1757. D. at Halle, Mar. 14, 1791. He took a prominent part in the starting of the rationalistic movement in the German theology, but he was cautious in forming his views and careful in arguing them; and although his talent as an author was rather small, his works are pervaded by a spirit of genuine historical criticism, which exercised great influence. His principal works are *Apparatus ad liberalem Veteris Testamenti interpretationem* (Halle, 1773); *Abhandlung von freier Untersuchung des Kanons* (4 vols., 1771-75); *Versuch einer biblischen Dämonologie* (1776); *Versuch christlicher Jahrbücher* (2 vols., 1783-86); and an autobiography (2 vols., 1781-82). Revised by S. M. JACKSON.

**Semlin (Hung. Zimony)**: town of Austria, at the eastern end of the military frontier, at the confluence of the Save and the Danube, opposite Belgrade (see map of Austria-Hungary, ref. 9-H). It is poorly built, a large portion consisting of mud huts, but it carries on a very important transit trade between Austria and Turkey. Pop. about 13,000.

**Sem'mering, or Semering**: a branch of the Noric Alps, forming the boundary between Lower Austria and Styria; rises 4,416 feet above the sea, and contains, at an elevation of 3,066 feet, the principal pass leading from Vienna to Trieste. The first carriage-road was built here in 1728 by Charles VI., who placed at the turning-point of the road a memorial column with the inscription, *Aditus ad maris Adriatici litora*. In 1840 a longer but more comfortable road was completed, and in 1854 a railway was opened between Gloggnitz on the Austrian and Mürzzuschlag on the Styrian side, ascending to 2,893 feet, and leading through fifteen tunnels and over sixteen viaducts. The road was constructed by Carlo Chega, and was considered the most audacious and most ingenious engineering work of its kind.

**Semmes, RAPHAEL**: naval officer; b. in Charles co., Md., Sept. 27, 1809, of Scotch-Irish parentage; became a midshipman in the U. S. navy 1826; was a volunteer aide to Gen. Worth in Mexico 1847; became commander 1855; was secretary of the lighthouse board 1859-61; resigned at the beginning of the civil war; held a commission in the Confederate navy; obtained great notoriety by his exploits as commander of the Sumter and the Alabama in capturing and burning scores of U. S. merchant vessels. After the war he edited a daily paper in Mobile, Ala., subsequently becoming professor in the Louisiana Military Institute, but returned to Mobile to practice law. Author of *Service Afloat and Ashore during the Mexican War* (Cincinnati, 1851); *Campaign of General Scott in the Valley of Mexico* (1852); *The Cruise of the Alabama* (New York, 1864); and *Memoirs of Service Afloat during the War between the States* (Baltimore, 1869). He was editor of the *Memphis Bulletin* in 1867. D. at Mobile, Aug. 30, 1877. Revised by C. BELKNAP.

**Semoli'na** [from Ital. *semolino*, liter., dimin. of *semola*, bran (whence Fr. *semoule*, semolina) < Lat. *se'mila*, the finest wheat flour]: an article of food much used in France and Italy, and to a small extent also in Great Britain and other countries; consists of a finely cracked wheat, or a very coarse meal made from wheat. The hard-grained wheats of Spain, Odessa, and Southern Italy are best adapted for making it. As those wheats are not easily reduced to flour, small particles continually escape being crushed by the millstones, and after grinding they are separated into various grades. Semolina is used in making bread, puddings, and soups.

**Semp'ach**: village of Switzerland, canton of Lucerne; famous for the battle fought here on July 9, 1386, between the Austrians and the Swiss, in which the Austrian noblemen, in spite of their valor and superior numbers, were butchered like sheep by the Swiss peasants, as they were unable to use their horse, and unable to fight on foot encumbered by their heavy armor. The army of Duke Leopold, consisting of 4,000 horse, appeared before Sempach on July 9, 1386, and was there met by the confederated Swiss, numbering 1,300. As the ground was unfitted for the action of cavalry, the knights dismounted and formed themselves into a solid and compact body. The Lucerners charged, but the wall of steel was impenetrable, and not a man of the Austrians was wounded, while sixty of the bravest Lucerners, with their chief, were killed. Then Arnold von Winkelried, a knight of Unterwalden, rushed forward, grasped with outstretched arms as many pikes as he could reach, buried them in his bosom, and bore them down to the earth by the weight of his body. His companions rushed over his body into the breach thus made, slaughtered a great number of the armor-encumbered knights, and threw the remainder into the utmost confusion and dismay. See Otto Kleiser, *Die Quellen zur Sempacher Schlacht und die Winkelried-Sage* (Göttingen, 1873).

**Semper, GOTTFRIED**: architect; b. in Hamburg, Nov. 29, 1803; studied mathematics at Göttingen, architecture in Munich and Paris; traveled much in Italy, Sicily, and Greece; was appointed Professor of Architecture at Dresden in 1834; fled to London in 1849 on account of his participation in the revolutionary movements, and taught at the Royal Academy in Marlborough House till 1856, when he became Professor at the Polytechnic Institute of Zurich. In 1869 he was called to Vienna to give advice as to the proposed building of the museum, and in 1871 he settled there to superintend those important structures. In 1869 also he was employed upon the new Dresden theater in place of the one burned in that year; this building was not finished until 1878. His other important buildings are the Polytechnicum at Zurich, the Church of St. Nicolai in Hamburg, the synagogue at Dresden, etc. At the Universal Exposition of 1867 he exhibited a plan of a theater in Rio de Janeiro, for which he obtained a gold medal. He wrote *Die vier Elemente der Baukunst* (Brunswick, 1851); *Ueber Industrie, Wissenschaft und Kunst* (1852); *Der Stil in den technischen und tektonischen Künsten* (2 vols., Frankfurt, 1860-65), etc. He set forth with great decisiveness and defended with many ingenious arguments and acute observations the view that the antique architecture and sculpture were polychromic throughout, and he decorated the antique department of the Art Museum of Dresden in accordance with this principle. D. in Rome, May, 1879.

Revised by RUSSELL STURGIS.

**Semper, KARL**: naturalist; nephew of Gottfried Semper; b. at Altona, Germany, July 6, 1832; was educated in the naval school of Kiel and the Polytechnic School of Hanover, and studied natural science in the University of Würzburg. After visiting the principal countries of Europe he embarked in 1858 for the Indies, visited Manila, the Philippine Islands, China, and Japan, and was after his return to Europe, in 1866, appointed Professor of Zoology at Würzburg, and held the position until his death May 29, 1894. He visited the U. S. in 1877, and delivered a course of lectures before the Lowell Institute, Boston, published under the title *Animal Life as affected by the Natural Conditions of Existence* (New York, 1881). He published *Reisen im Archipel der Philippinen* (Wiesbaden, 1867-72); *Die Philippinen* (Würzburg, 1869); *Die Palau Inseln im stillen Ocean* (Leipzig, 1873); *Die natürlichen Existenzbedingungen der Thiere* (Leipzig, 1880), and other works. He also edited 9 volumes of *Arbeiten aus dem Zoologischen Institut in Würzburg*. Revised by J. S. KINGSLEY.

**Senancour, se-nañ'koor'**, ÉTIENNE PIVERT, de: author of *Obermann*; b. in Paris in 1770; educated for the priesthood, but disliking that profession ran away from home and lived in Switzerland, whence after a brief period of married life he returned to France, saddened by the loss of his young wife and beggared in fortune. His scanty earnings as a hack writer in Paris were supplemented by a small pension granted by Louis Philippe, but his struggle with poverty combined with domestic misfortunes and ill health to give his books a tone of deep melancholy. His *Réveries sur la Nature primitive de l'Homme* (1799) is strongly marked by the influence of Rousseau. *Obermann* (1804) is the story of

**Sonoma Falls:** village; Sonoma Co., N. V., on the Sonoma river (the outlet of Sonoma Lake), at the N. V. dam and Hot River Railroad, 2 miles W. of Clear Lake Park, a popular summer resort, and 16 miles W. of Anderson (see botanical notes of San Ysidro, ref. 5-E). A fall of 50 feet in the river gives the village its name and affords excellent power for manufacturing. The village contains manufactures of paper, freemasonry, pottery, machinery, and wooden goods.

job-printing establishment; 7 churches; an academy; a soldiers' monument; electric railway to Waterloo, Genesee, and Cayuga Lake Park; a national bank with capital of \$100,000, a savings and a private bank, and 4 weekly newspapers. Pop. (1880) 5,880; (1890) 6,116; (1895) estimated, 6,500. "COURIER" PRINTING COMPANY.

**Seneca Indians:** See IROQUOIAN INDIANS.

**Seneca Lake:** a body of water in Western New York, bounded by Seneca, Schuyler, Ontario, and Yates Counties. It is 35 miles long, from 1 to 4 miles broad, with an elevation of 447 feet, and its shores are bold, picturesque, and fertile. The lake is navigated by steamboats. Its waters reach Lake Ontario by Seneca and Oswego rivers. Its greatest depth is 630 feet.

**Seneca-oil:** a local name for PETROLEUM (*q. v.*).

**Senefelder, ALOYS:** inventor; b. at Prague, Bohemia, Nov. 6, 1771; entered on the stage at Munich, his father being an actor; afterward attempted literature, and engaged finally in the printing business, which led to his invention of LITHOGRAPHY (*q. v.*). Lack of money and the imperfection of the invention in its primitive state caused him many difficulties and disappointments, and it was not until 1806, when he settled at Munich and received the support of the Bavarian Government, that he was able to perfect his invention. D. at Munich, Feb. 24, 1834. He wrote a *Lehrbuch der Lithographie* (Munich, 1818; French translation, Strassburg, 1819; English translation, *Complete Course of Lithography*, 1819). See Nagler, *Aloys Senefelder und der geistliche Rath Simon Schmidt* (Munich, 1832).

**Sen'ega:** a drug consisting of the root of a polygalaceous perennial plant, *Polygala senega*, which grows throughout most parts of the U. S., frequenting open fields and rocky places. It is small, with small white flowers forming a close spike at the summit of the stem. The roots are of various sizes, tapering, branched, and twisted, with a thick gnarled head from which the several yearly stems arise. The epidermis is dark-colored, corrugated, and is the active part of the root. The dried root has little smell, but leaves a pungent and acrid impression in the mouth after chewing. Senega contains a peculiar principle called *polygalic acid*, probably identical with saponine. The drug is an acrid irritant, producing vomiting and purging in overdose. Its first use in medicine was by the Seneca Indians, who employed it as a remedy in cases of rattlesnake-bite, but by physicians it is used almost exclusively as an ingredient in cough-mixtures in the second stage of respiratory catarrhs. Its effects are analogous to those of squill. Senega is an ingredient of the compound sirup of squill of the *United States Pharmacopœia*. Revised by H. A. HARE.

**Senegal':** the largest river of Senegambia, Northwest Africa. It lies almost on the border of the Sahara, and derives its water chiefly from several large southern tributaries rising in the regions of Futa Jallon and Bambara. Though a bar at its mouth obstructs navigation from the sea, the lower half of the river (500 miles) is navigated at high water by small steamers. C. C. A.

**Senegal:** a French colony bordering on the Atlantic in the northwestern part of Senegambia, Africa. Pop. 135,000. There is a governor-general, assisted by a colonial council, at the chief town, St. Louis. See SENEGAMBIA.

**Senegam'bia** [named from *Senegal* + *Gambia*, names of its two chief rivers]: a French possession in Northwest Africa, with no well-defined boundaries on the E. and S. It borders on the Atlantic and the Sahara limits it on the N. The Gambia may be called its southern boundary, and its extension to the E. may be taken as including that part of the French Sudan lying W. of the upper Niger. The population, including the colony of Senegal and the upper Niger region, is believed to be about 1,850,000. In the seventeenth century France took possession of some points on the coast, but the great extension of the colony eastward dates from the middle of the nineteenth century, and particularly from the period 1871-88, which saw the gradual advance of the French power to the upper Niger, an acquisition that cost enormously in human life and money, on account of the trying climate and stoutly contested campaigns with powerful Mohammedan chiefs. The most formidable opponents of the French advance were the great religious pretenders and potentates, Mahmadu-Lamine, whose final defeat and death was the result of the campaign under Gen. Gallieni (1886-88), and Samory, the most powerful ruler in the French Sudan, who was not finally subdued until 1893. The vast ter-

ritory is for the most part sparsely peopled. It includes a number of distinct tribes, of whom the Mandingo, the Yolofs, and the Fulbe are the most important. The greater part of the country is very fertile, and rice, maize, tobacco, and cotton raising are capable of large development. In Senegal proper about one-third of the land is under cultivation, and the raising of cattle and sheep is a growing industry. The great drawbacks are the climate and the disinclination of the natives to labor, but in the best-cultivated regions the French, within a few years, have doubled the product. On the upper Senegal, in 1884-86, 45 per cent. of all the European residents died, the most fatal causes being sunstroke, dysentery, and malaria. The capital and chief port is St. Louis, on an island at the mouth of the Senegal. Pop. 20,000. From Kayes, the head of navigation on the Senegal, a railway has been built eastward 94 miles to Bafoulabe, and is to be extended to the upper Niger. Another railway connects St. Louis with Dakar, an important town at Cape Verde, and it is greatly assisting in the development of the coast districts. The most important interior settlements are Kayes, on the upper Senegal, Balfoulabe, at the mouth of the Bathoy, and Bamako, on the upper Niger, from which point the French have descended the river and occupied Timbuctu.

C. C. ADAMS.

**Senescence:** See OLD AGE, DISEASES OF.

**Senigall'ia, or Sinigaglia** (anc. *Sena gallica*): town; province of Ancona, Italy; near the Adriatic, at the mouth of the Misa, which divides the town into two parts (see map of Italy, ref. 4-E). The streets are broad and well paved, and some of them are flanked by fine buildings constructed with porticoes forming a continuous sheltered promenade. The maritime trade is carried on by means of a short canal, for which the lower arm of the Misa has been made available. The manufacturing activity is considerable, chiefly in silk and linen. The annual fair of Senigaglia (beginning July 22 and ending Aug. 8) was formerly one of the most famous in Europe, and is still much frequented. The town is the place of the victory of C. Claudius Nero over Hasdrubal (207 B. C.). Pop. 9,602. Revised by M. W. HARRINGTON.

**Senior, NASSAU WILLIAM:** economist; b. in Berkshire, England, Sept. 26, 1790; graduated at Oxford 1812; was admitted to the bar 1819; was Professor of Political Economy at Oxford 1825-30, and again 1847-62; was master in chancery 1836-53. D. in London, June 4, 1864. He was the author of essays upon political economy, philosophy, etc., of narratives of travel in Turkey and Greece (1859) and in France and Italy (1871), and was for forty years a leading contributor to *The Edinburgh Review* and other magazines.

**Senlac:** See BATTLE.

**Senna** [from Arab. *sana*, *senna*]: the leaves of several species of *CASSIA* (*q. v.*), various preparations of which are used medicinally. Those which constitute the commercial senna are exported from Southern India and from Alexandria. A senna-plant (*Cassia acutifolia*), indigenous in Egypt and the African deserts, furnishes most of the Alexandria senna. Great labor has been expended by chemists in endeavoring to isolate the valuable cathartic principle of senna, which was discovered by Dragendorff and Kubly in 1868 to be cathartic acid. It is a complex glucoside, and, singularly, contains sulphur. Like glucosides generally, it is easily alterable, and hence difficult of isolation and preparation. Further information may be had in the *National Dispensatory*, under *Senna*. Revised by H. A. HARE.

**Sennaar':** an ancient kingdom of the Eastern Sudan, Africa, which retained its name when it became a province of Egypt; lying mostly between the Bahr-el Azrek and the White Nile. The soil is so fertile along the river banks that Sennaar was long called the granary of the Egyptian Sudan, but away from the rivers the region is mostly an uninhabited sandy waste. In the flourishing days of the Egyptian Sudan there was a dense population along the two great rivers, in whose valleys a large amount of grain was raised, while in the towns gold-smelting, leather-working, pottery-making, and other industries were pursued. Sennaar, for generations the chief town, had great importance until Khartum became the center of commerce. Its population had dwindled to 8,000 before the Mahdist revolt. It was the last Egyptian stronghold to succumb to the Mahdi. Now only heaps of stone mark its site.

C. C. ADAMS.

**Sennach'erib** [Gr. *Σανναχέρηβος*; Heb. *San'chêrîbh*, from Assy. *Sin-achî-irîb*, liter., "the Moon-(god) has multiplied

totality of sensations. Bonnet (1755), von Holbach (1770), Buffon (1780), Cabanis (1798), Destutt de Tracy (1815), Laromiguière (1818) held the doctrine of sensationalism. Among recent German writers Czolbe has elaborated a system of psychology that derives all the elements of self-consciousness from sensation. But he has to assume teleological forms—"the sensations and feelings which are hidden in space or the world-soul"—to explain the "fundamental limits of knowledge." His contemporaries, however—Moleschott, Büchner, Vogt—proclaim not only sensationalism, but materialism without reserve. While Cabanis said that thought is a secretion of the brain, Carl Vogt added, "the brain produces thought in the same way that the liver produces bile," etc. John Stuart Mill (1865) defines matter to be "a permanent possibility of sensation," and mind to be "a series of feelings with a background of possibilities of feeling"; thus making sensation the central principle, not only of knowledge, but of being, and apparently reaching the doctrine of Berkeley, *Esse est percipi*. Post-Kantian sensationalism has had to explain away the existence of universal and necessary ideas, such as time, space, causality, etc. Mill holds the geometrical axioms to be "generalizations from observation." Herbert Spencer (1860) holds that knowledge consists in "symbolic conceptions" when it relates to aught else than concrete objects that are not "too great or too multitudinous to be mentally represented." In contrast to this, he holds that "the ultimate truth which transcends experience by underlying it is the persistence of force." Thus he makes in one instance all general ideas "symbolic," the real being particular things only; and then he makes force, which corresponds to the most symbolic of our ideas, to be the most real of realities. Within the period 1870-95 a more thorough study of physiological psychology by a scientific method has done more to clear up and reduce to exact knowledge the theory of the action of the five senses than the loose observations of twenty-five centuries previously. The articles on PSYCHOMETRY and PSYCHO-PHYSICS give the history and bibliography of this movement. It is too early to perceive the effects of these investigations into the essential nature of sense-perception upon general philosophical theories, but it is certain that they will modify very materially the conceptions and method of presentation of those who in the future defend the doctrine that all knowledge is derived from the five senses.

WILLIAM T. HARRIS.

**Senses** [from Lat. *sen'sus*, feeling, one of the senses, deriv. of *sen'ti-re*, *sen-sum*, feel]: special developments of the general sensibility of the living organism. In the special senses, i. e. hearing, sight, etc., the property of general sensibility of the organism has become immensely modified and intensified by being concentrated and localized in distinct organs, the ear, the eye, etc., and by being specialized so that each organ transfers from the object to consciousness only a distinct part of that total impression which the object is able to give and consciousness is capable of receiving—the ear only the audible, the eye only the visible, etc. There are five such senses—hearing, sight, smell, taste, and touch—but they all rise simply as individual developments of the same fundamental faculty of general sensibility. Their degree of individualization is very different, being highest in sight and feeblest in smell and taste; the latter both disappear very easily in mere feeling, as smell in sneezing and taste in nausea. It is apparent, however, that the general sensibility of the human organism covers a much larger ground than its five individual senses. There are sensations which enter into consciousness with great vividness without going through the special senses, as, for instance, the feelings of hunger, thirst, suffocation, pleasure, pain, rest, fatigue, etc., which are termed general sensations. See ACOUSTICS, MUSCLE-SENSE, VISION, etc., and *Organs of Special Sense* in the article HISTOLOGY. Revised by EDWARD T. REICHERT.

**Sensibility**: See FEELING and SENSATION.

**Sensitive Plant**: a low leguminous plant, *Mimosa pudica*, of tropical America, now widely dispersed over the world and commonly cultivated, on account of the rapid movement of the leaves which, when brushed or jarred, appear to shrink from the touch. This faculty is shared in a less degree by several other species of *Mimosa* and some related plants, such as the sensitive brier (*Schrankia*) of the southern parts of the U. S. See *Plant Movements* in the article PHYSIOLOGY, VEGETABLE.

**Senso'rium** [= Lat., the seat or organ of sensation, deriv. of *sen'sus*, sense, feeling]: the supposed seat in the

nervous system of the processes which underlie sensation. The cortex or gray matter of the brain is considered the sensorium in modern discussion in physiology and psychology. J. M. B.

**Sentence** [viâ O. Fr., from Lat. *senten'tia* (for \**sentien'tia*), way of thinking or feeling, opinion, judgment, deriv. of *sen'ti-re*, feel, think]: in the law, a judgment or determination pronounced by a court after the trial or hearing of a cause, by which the remedy is granted or the sanction is imposed. In the common-law courts the term is confined to criminal cases, their final decision in civil suits being called a "judgment"; while the corresponding act of a court of equity is usually denominated a "decree." In those tribunals whose procedure is based upon the civil law—in the admiralty courts, the English ecclesiastical courts, and sometimes in the U. S. in the probate or surrogate courts—the term "sentence" is used, instead of "judgment" or "decree," to designate all judicial determinations. The sentences in civil causes like judgments are either final or interlocutory—final, when they pass upon all the issues material to the decision, determine the rights and duties of the parties, and terminate the pending controversy; interlocutory, when they pass upon some collateral matter or proceeding in the action, or when they establish some right preliminary to the final adjudication. In criminal trials, according to the common-law methods, the sentences are all from their very nature final. It is the exclusive province of the jury to determine the guilt or innocence of the accused. When a verdict of guilty is rendered, the prisoner is thereby convicted, and it then becomes the duty and function of the court to pronounce upon him the judgment or sentence which the law provides as a punishment for his crime. Previous to this final act in all cases of felony the convict is publicly asked by the judge if he has anything to say why the sentence of the law should not be pronounced upon him. This proceeding, which was originated at an early period of the English law, when the prisoner could not be defended by counsel, in order that he might have an opportunity to suggest any error that had occurred, is now an empty form, and yet the form must be observed, or else the judgment would be void. No error being shown, the presiding judge declares the sentence, whereby the court orders the prisoner to be capitally executed on a certain day named, or to be imprisoned for a specified period, or to be fined in a designated amount, or otherwise punished as provided by law. This sentence is entered by the clerk, and constitutes a most important part of the judicial record. The doctrines and rules of the law in reference to the nature and effects of a JUDGMENT (q. v.) apply also to sentences. See the treatises of Bishop and Wharton on *Criminal Law*, and Black on the *Law of Judgments*.

Revised by F. STURGES ALLEN.

**Sentiment**: the higher form of emotion, attaching to ideals of art and life. (See IDEALS and IDEAL FEELING.) The great classes into which the sentiments fall are usually distinguished as ethical, æsthetic, and religious. The religious are the most complex, and rest upon the other two. Religious objects and ideals involve both the ethical and æsthetic determinations—that is, they are both beautiful and good.

**Ethical Sentiment: its Nature and Origin.**—Conscience is the popular term for this emotion. It involves three elements, which are, however, closely united in a single state of mind, called ethical. If we fancy the mental life cut right through at the moment of a moral decision, we should find three elements which moralists distinguish by the phrases moral quality, moral authority, and moral ideal. These may be made clearer by a concrete instance: I give money to a beggar because I am bound by conscience to do so. The moral quality of my act is my feeling of its harmony with my better acts as a whole, and the exact act I make upon other men to be charitable also; without this conscience would be wanting—the act would be indifferent. The moral authority of the act is the feeling which at once arises that this quality has an immediate reference to my will. I am bound to choose it as my act; without this there is no conscience—conscience is dead. The moral ideal is the outreach of my feeling toward a state of will in which such a relative and hesitating decision would yield to clear and more direct moral vision; a state of will which I can not picture, can not conceive, but which I feel my will is meant for, and for which my present act for conscience's sake is the only means to prepare me.

Moral sentiment arises evidently around acts and atti-

worths" of the ethical idealists, as well as the "real beauty in objects" of the realists—all these get their due, as far as their psychology is concerned, in some such formula as this: The sense of beauty is an emotional state arising from progressive psycho-physical accommodation to mental objects. Of course the metaphysics of beauty and art is not touched by this, and it does not prejudice full metaphysical treatment.

Seoul, sā-ool' [from Korean *seul*, liter., capital], or officially *Han-yang*: the capital of Korea; on the right bank of the Han-Kang, a tributary of the Yellow Sea; lat. 37° 31' N., lon. 127° 7' W. (see map of China, ref. 4-M). It is surrounded by a wall, 12 to 25 feet high, now partly in ruins, with eight gates which are closed at night. It has three straight streets, about 60 feet wide and starting from the three principal gates. These are fairly well kept, but the other streets are narrow, uneven, and filthy. There are but two noteworthy buildings, the palace of the king and a small Buddhist temple of white stone, once richly ornamented, but now much defaced. The other buildings are small, low, thatched, or tiled, and densely peopled, and these buildings encroach on the great streets, from which they are cleared from time to time. There are no arrangements for sanitation or public comfort. A noteworthy object is the great bell which sounds the hours for opening and closing the gates. It was made in 1468 and is alleged to be the third in size in the world. The city dates from 1397 A. D.; became a royal city at the end of the sixteenth century, and was sacked by the Manchus in 1637. It is the heart of Korea in the same sense that Paris is the heart of France, and the ambition of every Korean gentleman is to pass his life there, at leisure to enjoy its attractions. It was long forbidden to foreigners, and in 1888 a fanatical outbreak against foreign residents occurred. The city was occupied by the Japanese in 1894. Pop. (by census in 1793) 193,000, estimated by Cavendish (1891) at 250,000, of whom 50,000 were in the suburbs. See Cavendish, *Two Months in Korea*, in *Scottish Geographical Magazine* (Nov., 1894), and the works mentioned under KOREA. MARK W. HARRINGTON.

**Separate Baptists, Separate Churches, or Separates:** See BAPTISTS and FREE-WILL BAPTISTS.

**Separate Lutherans of Prussia:** those Lutherans who refused to comply with the order of Frederick William III. uniting the Lutheran and Reformed Churches. See LUTHERANISM AND THE LUTHERAN CHURCH (*The Lutheran Church in the Nineteenth Century*).

**Separatists:** in general, those who withdraw from an established church or religious organization; sectaries. The term was commonly applied in England in the sixteenth and early part of the seventeenth centuries to those Christians who were also called Brownists and Barrowists, and later INDEPENDENTS (q. v.).

**Sepla:** See INDIA INK.

**Sept'idā:** See CUTTLEFISH.

**Sep'oy** [Fr. *spahi*, *cipaye*, from Hind. *sipāhī*, native soldier, from Pers. *sipāhī*, horseman soldier, deriv. of *sipāh*, whence Hind. *sipāh*, military force, army]: a native soldier in the British service in India. The practice of employing the natives as troops dates back to the middle of the eighteenth century. A large force of Sepoys took part in the battle of Plassey, and Clive afterward organized a native army in Bengal. Their good conduct inspired general confidence in their loyalty, and their numbers were increased till at the time of the mutiny (see INDIA, *History*) they were about 230,000 strong, while the European troops numbered about 40,000. After the suppression of the mutiny (1858) their numbers were reduced, and in 1894 there were 145,000 natives to 75,000 Europeans in the British army in India. The Sepoys consist of Mohammedans, Rajputs, Brahmans, and men of other castes, besides Sikhs, Gurkhas, and hill-men of various tribes. The higher officers are European.

**September** [viā O. Fr. from Lat. *Septem'ber* (sc. *men'sis*, month), liter., the seventh month, deriv. of *septem*, seven]: the seventh month of the old Roman year, but the ninth of the Gregorian. It is the month of the autumnal equinox, which occurs about the 22d.

**Septicæ'mia:** See BLOOD-POISONING.

**Septima'nia** [Late Lat., deriv. of Lat. *septima'nus*, pertaining to the number seven, deriv. of *septem*, seven. So called from its seven cities—Toulouse, Agen, Bordeaux, Poitiers, Saintes, Périgueux, Angoulême]: an ancient district in the southwest of France; ceded to the Goths in 419. Its name appears in the writings of Sidonius Apollinaris (429-482). It was conquered by the Saracens in 712-719; devastated by Charles Martel in 737; conquered in part by Pepin in 760; became a part of the kingdom of Aquitaine in 778; became a dukedom in 817, a marquise in 844; and was devastated by the Normans in 859. The Spanish March was set off in 864, and soon after it passed to the house of Toulouse.

**Septim'ius Severus:** See SEVERUS, SEPTIMIUS.

**Septuages'ima** [Lat. (sc. *di'es*, day), the seventieth day, liter., fem. of *septuagesimus*, seventieth, deriv. of *septuaginta*, seventy]: in the ecclesiastical calendar, the third Sunday before Lent. The first Sunday in Lent is termed Quadragesima, the three preceding ones Septuagesima, Sexagesima, and Quinquagesima.

**Septuagint**, or LXX. [from Lat. *Septuaginta*, liter., the seventy, applied to this version because of the alleged number of its joint translators]: the name commonly given to the earliest Greek translation of the Old Testament, otherwise called the Alexandrian version. According to the fabulous account of its origin in the letter of the pseudo-Aristeas, repeated by Josephus (*Ant.*, xii., 2) and others, Ptolemy Philadelphus, King of Egypt from 283 (285) to 247 B. C., at the instance of his librarian, Demetrius Phalerus, sent an embassy to Jerusalem to procure from the high priest Eleazar a copy of the Jewish Law, and to make arrangements for a translation of the same into Greek for the Alexandrian Library. Seventy-two learned men were accordingly selected by the high priest, six from each tribe, and sent to Egypt with a magnificent copy of the Law written on parchment in letters of gold. They retired to the island of Pharos, where they completed the translation in seventy-two days. According to Philo (*Life of Moses*, ii., 5-7), they were divinely inspired. The legend appears with embellishments in Justin Martyr (*Hortatory Address to the Greeks*, chap. xiii. [*Ante-Nicene Fathers*, i., 278]), according to whom the translators were shut up in separate cells and worked independently, yet their several versions, being compared, were found to agree verbatim. So also Irenæus (*Against Heresies*, chap. xxi., 2; do., i., 451, seq.) and Clement of Alexandria (*The Stromata*, i., xxii.; do., II., 334). In this later form of the story the translation is made to include the whole Old Testament. All that can be inferred with certainty from this legend is the high estimation in which the translation was held by the Jews as early as the first century of the Christian era. There is no improbability in the supposition that Ptolemy Philadelphus may have procured a copy of the books of Moses for his universal library. Jews were then numerous in Alexandria. On the other hand, a translation of the Old Testament, or at least of the Law, must have become a necessity at that period to the Hellenistic Jews, to most of whom the Hebrew original, long before the Christian era, was a sealed book; and to this necessity alone it may have owed its origin.

The character of the translation proves it to have been the work of many hands. The Pentateuch is best translated. Anthropomorphisms and offensive expressions are, however, often softened; e. g. for "they saw the God of Israel" (Ex. xxiv. 10) we read "they saw the place where the God of Israel stood." The translation of Proverbs has considerable merit, and the book of Job was rendered by a man of genius, who was better acquainted, however, with the Greek poets than with Hebrew, and dealt very freely with his text. The speech of Job's wife (ii. 9) is a curious interpolation. Ecclesiastes is rendered with barbarous literalness, so as to be in some places unintelligible; e. g. Eccl. vii. 30. The prophets are for the most part poorly translated, especially Isaiah; and the translation of Daniel was so bad that the version of Theodotion was early substituted for it in Christian use, and but a single manuscript of it is known. In some books, particularly Jeremiah, a recension of the text was followed differing from our present Hebrew; to others, as Esther and Daniel, apocryphal additions were made. The version contains all the books commonly printed in the English Apocrypha of the Old Testament, except the second book of Esdras. Some manuscripts and editions add a third, others a fourth book of Maccabees.

The nearest relative of the genus is *Taxodium*, which is represented by the bald cypress of the southern Atlantic U. S. and Mexico. The foliage of the two species is strikingly different. The leaves of the redwood resemble those of the yew, being spreading and arranged comb-like on two sides of the branchlet; the cones are the size of a hazel-nut. The leaves of the big tree are smaller, awl-shaped, and closely oppressed to the branchlet; the cones of the size of an English walnut. The wood of the redwood is light, but firm, straight-grained, and handsome, although the rich brownish-red color fades on exposure without protection, while, like most of the cypress family, it is very durable. Only the redwood, which occurs in large quantities, affords a material of commerce, being lumbered on a large scale, and used for construction, interior finish, railway ties, etc.; the available supplies are being rapidly exhausted by the wasteful methods of lumbering. The tree is tenacious of life, the stumps even of the oldest trunks long retaining their vitality at the circumference, and sprouting into a circle of fresh young shoots, in which it differs from most other conifers. This tree (the redwood) occurs along the west slope of the Coast Ranges from Monterey Bay to the Oregon line, but is most abundant N. of San Francisco Bay up to lat. 40°. Where the redwood abounds it forms forests almost by itself. There are trees from 50 to over 75 feet in circumference and from 200 to 275 feet in height, and credible accounts are given of still larger ones. Archibald Menzies was the first botanist to collect specimens of the redwood (about 1810). They remained undescribed until 1832, when one of these specimens was figured by Lambert, and named *Taxodium sempervirens*. Soon after the tree was made known to botanists by David Douglas; in 1847 Endlicher founded upon it the genus *Sequoia*.

*S. gigantea*, the big tree, appears to have been first discovered in the spring of 1852 by a white hunter named Dowd, who reached the Calaveras grove. Specimens reached the Atlantic States and Europe in 1853, and Lindley first described the species as *Wellingtonia gigantea*, on Dec. 24, 1853; a figure of it also appeared in 1854 in *The Botanical Magazine*. The Californian botanists proposed to call it *Washingtonia californica*, and under this name it was published in the *California Farmer* in 1854. Meanwhile Dr. Torrey determined that this tree was of the same genus as the redwood—i. e. *Sequoia*—notwithstanding the difference in foliage, a conclusion announced also by Dr. Asa Gray in *The American Journal of Science* for Sept., 1854. Prof. Decaisne in Paris had already taken the same view, assigning the name *Sequoia gigantea*, which the tree now bears, as early as June 1854. (*Bull. Soc. Bot. France*, i., 70.) The name *Sequoia wellingtonia*, proposed by Seemann in 1855, is therefore antedated by *S. gigantea*, which must stand.

Although in general of greater size than the redwood, this tree is not so handsome. The branches are short, the spray less graceful. The wood is similar, but of a duller reddish hue. This species nowhere forms a forest by itself, but is mixed with other coniferous trees, mainly sugar-pines, and generally occurs in detached "groves." Its range in latitude is only between two and three degrees, in longitude being confined to a narrow belt on the western slope of the Sierra Nevada; its vertical range is restricted between 4,760 feet (at the northernmost locality) and 7,000 feet.

There are some twenty groups or groves segregated and named. The most northern grove known is situated in Placer County, 50 to 60 miles N. of the two groves, first discovered and most accessible in Calaveras County. The North Calaveras grove, covering 50 acres, contains ninety-three trees, of which four are over 300 feet high, the tallest standing, called the Keystone State, being 325 feet, and its diameter, 6 feet from the ground, 45 feet. Between these groves and the Merced river are two or three patches of big trees (Tuolumne and Merced grove), but none of great note until the Mariposa grove is reached. This is 16 miles S. of the Yosemite valley, and is in two patches, the lower one at 5,500 feet containing about 125 large-sized trees, one of the largest being the Grizzly Giant, over 93 feet in circumference at the ground, and over 64 at 11 feet, which is measured above the bulge of the trunk, characteristic of the cypress family. Most of these trees have been sadly injured by fire. About a dozen miles S. of this grove is the Fresno grove, said to contain about 600 trees, the largest 81 feet in circumference. From this district S. to the Tule river, but at greater elevations, trees appear to be more abundant than elsewhere, and more widely dispersed through the forest, the Dinky, King's river, New King's river, and Kaweah

having been named. The age of sequoias was formerly estimated as high as 4,000 to 6,000 years, but countings of an-

FIG. 1.—Grizzly Giant, "Wawona," 275 feet high, 28 feet diameter.

nual rings reduce the age of the oldest to between 2,000 and 2,500 years, most of them probably below this. Authentic accounts of the trees are to be found in J. D. Whitney's *Yosemite Book*, and in the writings of Muir, Clarence King, Lemmon, and others. See also *Garden and Forest*, especially vol. iii., p. 573, for a map of the groves.

FIG. 2.—Section of a big tree, 92 feet in circumference.

Both species seem to require for their success the humid atmosphere of the region in which they occur. They thrive well, however, in many parts of Europe, especially in England and Ireland. Several trees of the *Sequoia gigantea*, over 40 feet in height, are to be found in Rochester, N. Y. In former ages, seven or eight species were in existence and distributed over a large part of the world, especially in the Tertiary period, when it occurred all around the Arctic zone, and in Europe, as far S. as Greece. B. E. FERNOW.

**Sequoyah:** See GUESS, GEORGE.

**Séracs:** See GLACIERS.

**Seraing,** se'rañ: town; in the province of Liège, Belgium; on the Meuse; 4 miles by rail S. W. of Liège (see map of Holland and Belgium, ref. 10-G). It has large manufactures of steam-machinery, locomotives, iron goods, and mirrors, and has rich coal mines in its vicinity. Pop., with the commune (1891), 32,912.

tion of the law against strangers, but he could not own property, and could be sold with the land which he tilled. The terms *serf* and *villain* are used almost indiscriminately of the non-freemen, though originally the former term signified a lower order of bondman.

The abolition of serfdom in Europe was a gradual process. In England it gradually disappeared during the fifteenth and sixteenth centuries. It is mentioned for the last time in 1574 by a commission issued by Queen Elizabeth for its abrogation in the counties of Cornwall, Devon, Somerset, and Gloucester. In France, where both Louis IX. and Louis X. had sought support in the serfs against the feudal counts, serfdom was maintained, often in very harsh forms, up to the Revolution. In Denmark it was abolished in 1784 by Frederick VI., at that time heir-apparent only, but actually governing instead of his insane father; in Prussia in 1806 by von Stein; in Hungary in 1848 by the revolutionary anti-Austrian Diet; and in Russia in 1861 by Alexander II. See SLAVERY.

Revised by F. M. COLBY.

**Serge** [viâ O. Fr. : Ital. *sargia* < Lat. *serica*, silken garments, liter., neut. plur. of *sericus*, silken, deriv. of *seres*. See SERES]: a name applied to various twilled fabrics. Silk serge is a coarse and strong material used for lining coats, making light shoes, etc. Woolen or worsted and woolen serges are made for ladies' cloaks and other uses. Some kinds of coarse serge are employed for making the garments of certain ecclesiastics. Other finer kinds are in some countries used exclusively for shrouds.

**Sergeant** [viâ O. Fr. *serjant* : Ital. *serviente* < Lat. *serviens*, *servien'tis*, servant, vassal, soldier, liter., pres. partic. of Lat. *servire*, serve]: a non-commissioned officer (i.e. an enlisted soldier holding an appointment from the colonel authorizing him to exert a limited authority over his fellow soldiers) in the army and marines, of a rank higher than that of corporal. Each infantry company has a certain number of sergeants, one of which is of higher rank and pay than the rest, and is called first sergeant. Each battalion (or regiment, if, as in the U. S., it has but one battalion) has a sergeant-major, who is the highest non-commissioned officer of the battalion. He is the executive officer of the adjutant, and superintends the making out of details and the performance of other camp duties for the adjutant. There is also a quartermaster-sergeant to each battalion. In the U. S. service a number of quartermaster and commissary sergeants not attached to battalions, and the ordnance sergeants, whose duty relates to the care of ordnance, arms, ammunition, and military stores at the posts to which they are attached, are provided for by law to be selected from sergeants of the line who have served for a certain length of time as privates and non-commissioned officers.

Revised by JAMES MERCUR.

**Sergeant, JOHN, LL. D.**: lawyer; son of Jonathan D. Sergeant, lawyer; b. in Philadelphia, Pa., Dec. 5, 1779; graduated at Princeton 1795; was admitted to the Philadelphia bar 1799; was appointed a commissioner of bankruptcy 1801; was subsequently deputy attorney-general of Pennsylvania; sat several times in the Pennsylvania Legislature; was member of Congress 1815-23, 1827-29, and 1837-42; was the leading representative of the Northern States in advocating the passage of the Missouri Compromise Act 1820; was minister to the Panama congress 1826; Whig candidate for the vice-presidency on the ticket with Clay 1822, in which year his *Select Speeches* were published; president of the Pennsylvania constitutional convention 1830; declined the mission to England 1841; for half a century was regarded as one of the leaders of the Pennsylvania bar. D. in Philadelphia, Nov. 23, 1852.

**Sergi, sār'jē, GIUSEPPE**: psychologist and anthropologist; b. at Messina, Sicily, Mar. 22, 1841; educated at Messina; became Professor of Philosophy in lyceums at Messina and Milan; in 1880 Professor of Anthropology in the University of Bologna, and in 1884 professor in the University and director of the Institute for Anthropology at Rome. His principal works are *Elementi di Psicologia* (Messina, 1879); *Teoria fisiologica della Percezione* (Milan, 1881); *L'origine dei fenomeni psichici* (Milan, 1885); *Psychologie physiologique* (French trans., Paris, 1887); *Principi di psicologia*, vol. i., *Dolore e Piacere* (Milan, 1894); together with many anthropological memoirs. J. MARK BALDWIN.

**Sergipe**, originally **Sergipe del Rey**, sār-zheep'-ā-dāl-rā': an eastern maritime state of Brazil; between Bahia, Alagoas, and the Atlantic. Area, 15,090 sq. miles. The interior

is included in the Brazilian plateau, which is here low, much broken, and has little forest; a broad belt of lowland is separated from the ocean by extensive sand-dunes. The great SÃO FRANCISCO RIVER (q. v.) forms the northern boundary; aside from it the state has only a few insignificant streams, and the mouth of the São Francisco forms the only harbor. The climate is dry and much of the land is unfit for agriculture; the best is in the coast belt and on the edge of the plateau, where sugar and cotton are cultivated. In the interior cattle-raising is the principal industry. Sergipe is the smallest and one of the least populous and progressive of the Brazilian states. The exports are hides, sugar, cotton, tobacco, and a little gold obtained from surface-washings. Pop. (1894) estimated, 261,991. Capital, Aracajú, a small town on the coast. H. H. SMITH.

**Sericulture**: See SILK.

**Series** [from Lat. *series*, connection, row, succession, series, deriv. of *serere*, join, bind together]: in mathematics, a succession of terms whose values proceed according to some law. The most familiar examples are the progressions of elementary algebra, called respectively arithmetical and geometrical progression. A series may terminate at a certain term, but more commonly it may be continued without end. In the latter case it is called an *infinite series*. The above-mentioned progressions are examples of infinite series, because either of them, when once started, may be continued indefinitely.

An infinite series may be either *convergent* or *divergent*. A convergent series is one the sum of all of whose terms approaches a certain limit if the series is continued indefinitely. A familiar example of this is afforded by a decreasing geometrical progression. Students of algebra know that the progression

$$1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \text{etc., ad infinitum,}$$

will approach 2 as a limit, always differing from that limit by a quantity equal to the last term included in the addition, which term may be made as small as we please by continuing the series.

A divergent series is one the sum of whose terms does not thus approach a limit. A series may be divergent in two ways; the sum of the terms may increase beyond all limit, when their number becomes infinite, and may therefore be called infinity. But the sum may also be continually larger and smaller, without increasing indefinitely. Such a series is

$$1 - 1 + 1 - 1 + \text{etc.}$$

The sum of this series will always be either 0 or 1, according as the number of terms added is even or odd. It is therefore called divergent.

Series are of very extensive use in advanced mathematics, especially in the applications of algebraic methods, because of the great number of quantities which can not be expressed in any other way. Quantities expressed by a series are said to be developed in a series, and if the series is convergent their true values can be found with any degree of accuracy by taking a sufficient number of terms. But if the series is divergent the development is made is divergent, it can not represent the quantity. S. NEWCOMB.

**Serinagur**: city of Kashmir. See SRINAGAR.

**Seringapatam**: city of Southern India and formerly capital of Mysor; on an island in the Cavry, in lat. 12° 25' N., lon. 76° 48' E. (see map of S. India, ref. 6-D). Under Hyder Ali and Tippoo Sahib its fortifications were strengthened, and although unhealthful it had 300,000 inhabitants. In 1799 it was conquered by the British, and now it has less than 12,000 inhabitants, and these mostly in the suburb of Ganjam. M. W. H.

**Sermon**: See HOMILETICS and HOMILY.

**Serous Membrane** [*serous* is deriv. of *serum*. See SERUM]: in the human body the membranous walls of the arachnoid, pleural, pericardial, and peritoneal cavities, and the investing membrane of the testis. Serous membranes in all instances, save the peritoneum in women, are closed sacs, with their opposed walls more or less in contact, but lubricated by secreted serous fluid, so as to permit of free motion. The serous membrane is therefore a contrivance of nature to insure the freedom of the large organs of the body in the limited movements incident to their functional activity. The movements of the heart, lungs, and intestines, the more limited increase and decrease of size of the brain, and the considerable friction of the joints are facilitated and made easy by the well-lubricated serous mem-

representatives of the order as a whole live in hot regions, and are averse to cold. They are absent altogether in the extreme northern and southern countries, and sparingly developed and hibernating during cold weather in the temperate regions, but almost equally abundant in the tropical regions of the several quarters of the globe. In the northern part of the U. S. only three species of the poisonous snakes (the scale-headed and plate-headed rattlesnakes and the copperhead) occur, and the greatest number in any one region within the U. S. are found in Arizona and New Mexico. See POISON OF SERPENTS and the names of different genera and species.

Revised by F. A. LUCAS.

**Serpent-stars**: See OPHIUROIDEA.

**Serpent-worshippers**: See OPHITES.

**Serpukhof**: town; in the government of Moscow, Russia; on the Nara; 57 miles by rail S. of Moscow (see map of Russia, ref. 7-E). It has a fine cathedral of the fourteenth century, and manufactures of linen fabrics of different descriptions, mostly coarse; also leather, paper, earthenware, and furniture. Pop. (1888) 22,718.

**Ser'pula** [Mod. Lat., from Lat. *ser'pula*, little snake, deriv. of *ser'pere*, creep]: a genus of annelids which build calcareous tubes in which they live. The head is surrounded with feathery tentacles, one of which is modified into a stopper to close the aperture of the tube when the animal is retracted.

**Serra, JUNIPERO**: missionary; b. in the island of Majorca, Nov. 24, 1713. He entered the Franciscan order, was sent to Mexico in 1749, and labored for years among the Indians of the northwestern districts. When the Jesuits were expelled, in 1767, their missions were placed in charge of the Franciscans. Father Junipero was made president of those of California, then confined to the peninsula of Lower California. One of his first measures was to extend his field to Upper California (now California). The San Diego mission was founded July 16, 1769, Monterey soon after, and others later. These were the first civilized communities within the bounds of the present State. Many of the buildings remain. D. at the San Carlos mission, Aug. 28, 1784. See Bancroft, *History of the Pacific States: California, and The Century Magazine* (May, 1883).

H. H. S.

**Serra do Mar**: a division of the Brazilian Coast Range bordering the coast or running near it from Southern Paraná to Espírito Santo. The Parahyba valley separates it from the Serra da Mantiqueira. The bizarre forms of many of its peaks make this region extremely picturesque. It culminates in the ORGAN MOUNTAINS (q. v.).

H. H. S.

**Serran'idæ** [Mod. Lat., named from *Serra'nus*, the typical genus, from Lat. *ser'ra*, saw]: a family of fishes of the sub-order *Acanthopteri*, including the sea-bass, groupers, jewfish, etc. The body is oblong and compressed; the scales ctenoid and generally moderate; the head compressed, and more or less pointed; the supramaxillary bones not retractile behind under the supraorbital bones; the spinous portion of the dorsal fin about as long as the soft or longer; anal like the soft portion of the dorsal, and with three spines. The variation in size among the species of the family is great, some being only a few inches long, while others exceed 7 or 8 feet. Among the gigantic forms are the jewfish (*Promicrops guasa*) of the Southern States and Cuba, which attains a weight of 500 or 600 lb., and the *Stereolepis gigas* of California, which appears to attain an equally large size. Almost all the species are esteemed as food.

**Serrano y Dominguez**, sār-raa'nō-ee-dō-meen'gāth, FRANCISCO, Duke de la Torre: soldier and statesman; b. at San Fernando, near Cadiz, Spain, Sept. 18, 1810; entered the army and rose rapidly in rank; joined Narvaez in effecting the overthrow of the regent Espartero in 1843; became lieutenant-general and senator in 1845, and obtained such influence over the young queen after her marriage (1846) as to give rise to much scandal. After taking part in several political intrigues and holding some important offices, he became captain-general of Cuba 1860-62, and won a dukedom as a reward for his successful efforts to reannex San Domingo to Spain. In 1866 he became president of the senate in Spain and suffered a short imprisonment in the same year. His continued opposition to the Government caused his exile to the Canary Islands July, 1868, when he took part with Prim and Topete in effecting the revolution which drove Isabella from the throne. He then became the ostensible head of the Government as president of the council of ministers and commander-in-chief of the army; was elected regent June 16, 1869; negotiated the acceptance of the Spanish

crown by Prince Amadeus of Italy, by whom he was made premier Jan., 1871; resigned that post in July of the same year; took the field as commander-in-chief against the Carlists Apr., 1872; concluded with them the convention of Amorevieta in May; returned to office as premier for a few months; fled to France soon after the proclamation of the republic (Apr., 1873), but shortly returned; was made chief of the executive after the *coup d'état* of Gen. Pavía Jan., 1874, and remained at the head of the Government till the end of the year, when he resigned his authority into the hands of Alfonso XII. D. in Madrid, Nov. 26, 1885.

F. M. COLBY.

**Serto'rius, QUINTUS**: Roman general. He was a native of Nursia in the country of the Sabines; distinguished himself in the battle of Aquæ Sextiæ (102 B. C.) under Marius. He fought with Cinna at the Colline gate in 87 B. C. against Pompeius Strabo, but he did not participate in the bloody massacre which Marius instituted at the capture of Rome. On the contrary, he put to death a gang of about 4,000 slaves whom Marius had let loose on the city, and who had perpetrated the most horrible cruelties. In 82 B. C. he was sent to Spain as proprator, but in the same year Sulla returned to Rome from Asia, and the power of the democratic party came to a sudden end. Although he had in the beginning only a small army, Sertorius maintained his position in Spain against the leading generals of Rome. He gained the favor of the natives, especially the Lusitanians, who became his faithful allies, and gradually drew about him the remnant of the Marian party. In 74 B. C. he formed an alliance with Mithridates. Metellus Pius, whom Sulla first sent against him, was repeatedly defeated, and even Pompey, who came to Spain in 76 B. C., achieved nothing, and was driven back across the Ebro. But intrigues and jealousies arose in Sertorius's camp, and in 72 B. C. he was invited to a banquet by Perpenna and treacherously assassinated at the festival. His biography by Plutarch is very interesting, though more full in its description of his personal character than in its narrative of his exploits.

Revised by G. L. HENDRICKSON.

**Sertulariæ**: a group of HYDROIDA (q. v.) of uncertain position. They form colonies sometimes 10 inches in height. The individual polyps are situated in horny cases (thecae). No medusa (jellyfish) stage occurs in the life-history.

**Serum** [from Lat. *ser'um*, whey; cf. Gr. *ops*, whey, and Sanskr. *sāra*, curds]: the watery portion of certain animal fluids. Serum of milk is whey containing no albuminous matter, whereas serum of blood, the fluid part left after the separation of the coagulum from blood, is a strong solution of albumen in a liquid containing certain salts, neutral and alkaline. The total amount of saline matter in the serum of a healthy man is somewhat over 10 per cent., and there are present carbonates and phosphates of sodium, potassium, calcium, and magnesium, with considerable chloride of sodium, some chloride of potassium, a sulphate of sodium and potassium. The amount of albumen is in the neighborhood of 7 per cent. Both the salts and the albuminous matter prevent the solution of the blood globules, which are very soluble in water itself, and are attacked at once on addition even of a very little water to blood. The physiological and pathological properties of blood serum have recently occupied much attention, and there bids fair to be great advancement in the treatment of disease, based upon these studies. The serum of an animal is known to possess properties which render it more or less destructive to invading micro-organisms. According as this is ill or well developed will be the likelihood or unlikelihood of a severe attack.

Revised by W. PEPPER.

**Serum Therapeutics**: that department of medical practice which secures IMMUNITY (q. v.) by the introduction of certain substances in the blood which act in an antagonistic manner to the bacteria of the disease in question, or to the toxic substances developed from these or by them. According as the protective substances are present in large or small quantity, permanently or temporarily, so will be the permanence and completeness of the immunity. The same sort of immunity may be developed by artificial inoculation with the specific micro-organisms themselves. The latter may be made less powerful by certain methods of cultivation, as was done by Pasteur in the case of the anthrax bacillus, or they may be injected in small amounts, and thus immunity developed without risk of a serious attack. Immunity may, however, be obtained by injection of the products of the bacteria, obtained either from cultures of

in the blood of a person or animal, caused a stupor induced by a natural or experimental infection disease. The same substances in larger doses caused a permanent coma.

Recently this treatment has been particularly lauded in France. The exact method by which the antivenereal substances are prepared is as follows: However, the products of the factory are furnished with cultures of bacilli in human organisms, rendered less virulent by additional inoculation of other antivenereal, or with small quantities of these organisms. There is thus satisfaction, especially in the matter of safety, with the use of a vaccine, as the animal may be regarded with greater confidence than usual. After repeated injections, and with the animal becoming practically immune from the effects of the poison. The blood serum obtained from an animal will be serviceable for the production of artificial immunity in a human animal, or in larger doses it will prove serviceable in the treatment of disease. Whatever the outcome of this method of treatment may prove to be, it is however a substance that certainly may be considered upon par with the way for infection with the organisms of the venereal disease, anthrax, cholera, typhoid, pneumonia, and other diseases. **WILLIAM PERKIN.**

**Servia.** The *Philæas* breed an animal of the *Equus* or cat family having a slender body small head long legs long neck longer hind body spotted with dark brown, the general color being rufous and the lower parts white. It is about the size of a cat, of the tail, which is tipped and ringed black. It is found in the southern part of Africa.

**Servant.** See **MASTERS AND SERVANTS.**

**Servius Lupus.** pseudonym writer; b. about 805; was born in the municipality of Etruria, in the district of the *Florentia* and died about 870 in Faldunaria Rahmura Roma. He was once he lived at the court of Louis the Great and in 844 he was made abbot of *Prætorium* by Charles the Great. He played quite a prominent part in the ecclesiastical history of his time. In the controversy between *Prætorium* and *Hieronymus* he sided with the former, but afterwards from both by the words of the *Chronicle* and by the *Chronicle*. He wrote *quædamque* and *Collectanea*. His works, which also comprise a number of very interesting letters and letters, *Historia de Deo*, Paris, 1869; *Chronica de Migne*, *Patrol. Lat.*, xix. See *Nachricht. über die Geschichte der Literatur* (Paris, 1861); *E. Sprague, Servius Lupus* (Boston, 1880). Revised by S. M. Jackson.

**Servius Mianus.** the popular Latinized name of *Servius Mianus*, theologian; b. at Vidinova, near Sarajevo, where in 1841, or more probably at Tuzla, in Bosnia, 1811, as some believe, though contradictory, including the latter place and date, son of a notary, who sent him at the age of thirteen or fourteen to study law at the university of Padua, France, gave his attention principally to theology, in which he became proficient; visited Rome, was present at the coronation of Charles V. at Rome (1844), traveled in Germany and Switzerland; became acquainted with many of the Reformers and partially adopted their doctrine; read some months at Basel, where he became friendly with the celebrated Hans Haagen, a contemporary, and benefited for the first time his critical and the ancient doctrine of the Trinity; possessed to himself, frequented himself with the teachings of the medieval *Augustine*, *Baron* and *Caputo*, went thence to Vienna, where he published his *De Trinitate* (1846) and *De Augustino de Trinitate* (1847); works which were received with both Roman Catholics and Protestants; took up his residence at Lyons under the name of *Servius Mianus* (1848); studied medicine, and received his degree in 1849 as an editor of scientific works; returned to Paris (1851); studied medicine under *André*, *Baron* and *Caputo*, took the degree of M. D. with *André* and *Caputo*, in which year he first met with *Calvin*; became acquainted and popular lecturer at the university of Lyons; became a doctor and published a treatise, *De Trinitate* (1857), attacking opinions of *Augustine* of the *Trinitate* (1857); had about this time a conference on theology with *Calvin*, who pronounced *Servius* to be set him right on theological matters; proceeded to *Charlton* near Lyons (1858); lived some time at *Arvieux* (published at Lyons editions of *Augustine* (1861) and of the Bible (1862) with

*Latin* notes, which were considered as heretical by the Roman Catholic Church; took up his residence in 1848 at *Vienna*, *Thuringia*, living as a reformed physician in the palace of the archbishop, *Prætorium*, a former pupil, carried on with *Calvin*, *Baron* and *Caputo* an active theological correspondence, which resulted in 1849 in a bitter quarrel; published anonymously his *Trinitate* (1850), *Trinitate* (1850), *Trinitate* (1850), the authorship of which was recognized by *Calvin*, to whom he had sent much of it in *Miss* and made known to him by the Roman Catholic Archbishop of *Vienna*, *Thuringia*. *Arvieux* and *Thuringia* by the imprisonment at *Vienna* at the instance of that prince. *Servius* would probably have been a spoiled for lack of acknowledgment by *Calvin* and paid punishment of his correspondence as regards *Calvin*. *Servius* escaped from prison, crossed the frontier into *Prussia*, and remained in concealment until nearly a year later. Meanwhile his trial went on; he was condemned to death, and ordered to die at *Vienna* (1857, 1858). He then resolved to go to *Basel*, but by a strange fatality, went first to *Vienna* to *Thuringia*, where, his presence being known to *Calvin*, he was arrested, brought to trial (Aug. 14) before the municipal court on charges of heresy, sedition, insult to the *Bishops* of the *Church* and injury against *Calvin* and other *Protestant* divines; was found to deserve death; put with *Calvin*, who appeared as prosecutor and drew up the final act of accusation, thirty-eight in number; was read aloud to the stake, and notwithstanding the desire of *Calvin* for his decapitation and other forms of death, was burned alive on 11th Nov. 1858, at 57. The Roman Catholic population had previously done violence to the same population. The Reformers generally, including *Mohammedans*, approved his execution. *Calvin* indignantly had been informed of his accidental presence in *Vienna* but he had threatened him with death if he came within his reach and he kept his promise he had made. *Letters* of *Servius* have been published by *Mohammed* (1756), *Trinitate* (1810), *W. H. Deussen* (London, 1848), and *Reimann* (1865). Cf. *Servius Lupus* (1869), vol. vii. The most careful study of his career and the best authority on his life is *H. Toller's* *Trinitate* (1869), *Trinitate* (1869), and many articles that *Toller* published in various journals. The theological position of *Servius* was extremely individual. He was an *Arrian*, and while denying the trinitarianism of the *Godhead* and the eternity of the *Son*, he was passionately devoted to the personal Christ and equally to the Bible as the sole standard of authority. He was a boundless intellectual curiosity, a wide and various culture, an absolute sincerity, but with a love of controversy, not peculiar to him in his generation, which brought him into frequent danger and finally to a cruel death.

Revised by J. W. Chapman.

**Servia** (from *Ruse*, *Serbyn*, *Serbi*, of *Serbi*, a *Serbian*, from *Serv*, *Serb*, a *Serbian* (Turk. *Serbi*); a kingdom of Southern Europe in the Balkan peninsula, between 42° 20' and 45° N. lat. and 19° 10' and 22° 45' E. lon. It is bounded N. by the Austro-Hungarian empire, from which it is separated by the *Sava* and *Drava* rivers, E. by *Romania*, from which it is separated by the *Danube*, and *Bulgaria*, S. by *Bulgaria* and *Albania*, W. by *Albania* and *Bosnia*. Area, 49,000 sq. miles.

**Topography.** *Products*, *Commerce*, etc.—*Servia* is divided by the river *Morava* into two principal sections. The western section is broken by the *Tatara* Alps, the eastern by the *Balkan*. At Orsova, on the *Danube*, the *Serbs* are separated from the *Carpathians* by a narrow defile, called the *Iron Gates*, through which the *Danube* rushes. From its northern frontier, dominated by the *Kapuskine* Mountains nearly 7,000 feet high, *Servia* slopes to the north in a roughly inclined plane and on the north-east spreads out in level tracts. The soil in the valleys and lower regions is fertile, producing rice, maize, wheat, flax, hemp, and tobacco. Along the *Danube* are numerous vineyards and orchards, especially of *plum*-trees, whence the *Alcoholic*, a popular sort of *brandy*, is obtained. More than half the territory is covered with forests, wherein oaks and waxes abound. Iron, copper, lead, and coal are found in suitable localities, but absence of roads and lack of enterprise prevent their being worked. From the same cause the forests are untouched, except that they are given over to raising immense herds of swine. These herds are exported, and constitute the chief industry and the principal source of revenue. There are practically no manufactures except in a primitive way, as each household supplies its own necessaries.

ties. Commerce is confined to the exportation of raw materials and the importation of the most essential manufactured goods. The system of agriculture is simple and rude; little attention is paid to education, and the condition of the country and people presents a striking contrast to the progress made by Roumania and Bulgaria since 1870.

The unit of value is the dinar or franc. During the fiscal year 1894 the state receipts were 63,755,600 dinars; expenditures, 63,736,300. The public debt is 359,144,500 dinars. In 1893 the imports amounted to 40,922,525 dinars, seventieths of which were from Austria-Hungary; exports, 48,910,400, about five-sixths of which were to Austria-Hungary. There are 388 miles of railway. Length of telegraph lines, 1,946 miles; offices, 143.

Servia is an hereditary monarchy. The national assembly or Skupstchina consists of 134 members and meets annually. Pop. (1894) 2,256,084. Except 149,684 Roumanians and 37,581 gypsies (1891), there are few not of the Servian race. With rare exceptions the inhabitants belong to the national Church, the Eastern Orthodox or Greek. Pop. of chief towns (1890): Belgrade, the capital, 54,249; Nisch, 19,877; Kragujevatch, 12,669; Lescovatch, 12,132; Pojarevatch, 11,134. In 1892 there were 20,934 marriages, 93,833 births, and 74,128 deaths. By statute of 1889 military service is obligatory on every able-bodied male Servian from the age of twenty-one to fifty-one; 1 year in active service, 9 in the reserve, 10 in the first division, and 10 in the second division of the national militia. Servia claims ability to put into the field 5,700 officers, 239,950 men, with 45,100 horses and 402 cannon.

**History.**—The Servians are a branch of the Slavic family. During the seventh century they were induced by the Byzantine emperor Heraclius I. to abandon their homes in the Carpathians and colonize the then depopulated territory between the Danube and Adriatic. Bound to the Byzantine empire by friendship and allegiance, they formed an efficient defense against the barbarians of the north. Christianized in the ninth century, Servia became independent in the eleventh, and its sovereign, the Grand Shupane, was recognized as a king by Pope Gregory VII. Stephen Dushan, the tenth sovereign, conquered nearly all the Balkan peninsula, threatened Constantinople, and in 1346 took the title of czar. In 1389, at the terrible battle of Kossova where the Servian king Lazarus and Sultan Murad I. were slain, Servia lost its independence, and disappears from history till the early part of the nineteenth century. Then the peasant Kara George, aided by Russia, expelled the Ottomans, and ruled from 1804 to 1813. Again the Ottomans overran the country when the swineherd Milosch Obrenovitch, who had assassinated Kara George, headed a desperate resistance during fifteen years. Supported by Russian diplomacy he forced the Porte in 1830 to recognize him as hereditary prince of Servia. In 1869 a constitution was framed, according to which the Government appointed one-third of the Skupstchina, while the electorate of the other two-thirds was greatly restricted. In 1876 Servia declared war against the Ottomans, and was saved from destruction only by the interference of Russia. The Congress of Berlin (1878) recognized the independence of the principality, and increased its territory on the south at the expense of the Ottoman empire. Servia declared itself a kingdom Mar. 6, 1882. In Nov., 1885, King Milan made an unjustifiable attack on Bulgaria, but was ignominiously defeated and his kingdom maintained intact only through the intervention of Austria-Hungary. In 1889 a more liberal constitution was granted, all taxpaying citizens becoming electors, by whose votes the entire Skupstchina was elected. The Servians are a brave and generous people, and the unfortunate history of Servia since 1868 is largely due to the influence of their incapable and pusillanimous ruler, MILAN I. (q. v.), who on Mar. 6, 1889, abdicated in favor of his son, Alexander I. The latter in May, 1894, by a *coup d'état*, abolished the new constitution and restored that of 1869.

**Servian Language:** See SLAVIC LANGUAGES.

**Servian Literature:** in its broadest sense, the literary monuments of the Servian or Servian-Croat language, spoken by most of the inhabitants of Servia, Bosnia, Herzegovina,

Montenegro, Dalmatia, and Croatia (including Slavonia), about 6,000,000 in all. This belongs to the southern division of the Slav languages, and, though somewhat influenced by Turkish, is most closely related to Bulgarian, Slovenian, and Russian. In a narrower sense the term Servian is restricted to Servia alone. The Servian and Croat languages and literatures, although essentially of the same origin, and differing in little except that the former employs the Cyrillic (Russian) alphabet and the latter the Latin, had for centuries an independent development, owing to political, religious, and territorial influences. While Croat literature developed under the Roman Catholic Church and Western European influences, Servian literature, as the intellectual medium of a people belonging to the Greek-Oriental Church, grew under the influence of that Church and the Byzantine empire. Consequently the Servians received with the Old Slovenian liturgy also the Old Slovenian or Old Bulgarian language. This, by an admixture of dialectic peculiarities, was gradually moulded into the so-called Servian Church Slavonic, in which, until the destruction of the Old Servian realm (battle at Kossova in 1389), a rather extensive Church literature was produced.

**Early Servian Literature.**—Among the first writers was Stephen, first King of Servia (crowned in 1217), who wrote a biography of his father, Stephen Nemanjas (ed. by Šafarik, *Život sv. Simeuna*, Prague, 1868 and 1870). His brother Sava, who founded the Servian monastery Chilandar on Mt. Athos, and was in fact the apostle of the Servian people, wrote a legend, a ritual, and a liturgy from Old Bulgarian sources. Domentian wrote lives of St. Sava and St. Simeon (ed. by Daničić, Belgrade, 1865). The *Rodnoslov*, by Archbishop Danilo (1291-1338), is a genealogical account of Servian kings and archbishops (ed. by Daničić, Agram, 1866). These works were of a panegyric ecclesiastical nature, hardly popular enough to encourage secular literature.

The most important productions for the study of the old language and history of Servia are the documents and records of the old kings, and especially the *Zakonik* (a collection of laws), by King Stephen Dushan (d. in 1356). The Turkish yoke after Kossova almost completely checked literary life in Servia for nearly 400 years; but the Gospels were printed in Belgrade in 1552, and Georg Branković, during his captivity in Eger, wrote a chronicle of Servia from the origin of the Servian people to about 1700.

**Literary Activity during the Turkish Supremacy.**—While Servian literature was thus suppressed by the Turkish conquest, a similar and cognate literature sprang up and attained full development in the Illyrian towns or the Dalmatian cities and islands from the end of the fifteenth to that of the seventeenth century, gradually declining thereafter. Its language was Croat (West Servian-Croat) in the old historic sense, although in the south (at Ragusa) the South Servian or Herzegovinian dialect predominates. This literature frequently loses the national Slavic color owing to the imitation of the various Italian literary movements. A considerable portion of it is actual translation from the Italian, but most of it is lyric poetry, love songs in the style of the Italian sonnet poetry, idyllic tales, and epics; even the drama is represented in both tragedy and comedy. The oldest writer of this literature is Marko Marulić, at Spalato (1450-1524); his poetry is biblical, its form yet rather imperfect. The island of Lesina produced two masterly poets—Hannibal Lučić (1480-1525), author of lyric songs and the drama *Robinja*, and Peter Hektorović (1486-1572), who wrote the descriptive poem *Ribanja* (a fisherman's tale). Then Ragusa took the leadership, owing to such lyric poets as Menčetić (1457-1501) and Držić (d. about 1510), both masters of love poetry. Greatest of all was Ivan Gundulić (d. 1638), the author of the epic *Osman*, celebrating the Polish victory over the Turks at Chocim. In 1667 Ragusa was destroyed by an earthquake, which ended its material and intellectual development. Jacob Palmotić (d. 1680) portrays its destruction and rebuilding in his epic *Dubrovniki ponovljen* (Ragusa Renewed). The works of Dalmatian poets have been edited by the South Slavonic Academy at Agram (1869, seq.).

**The revival of Servian literature** was due to the political struggles carried on by Austria against the Turks for the liberation of the Servian people, at the end of the seventeenth and the beginning of the eighteenth centuries. A considerable part of Servia was thus restored to Western European life and civilization, but at the same time a reaction against the latter took place; Russian teachers were called to the schools, and the Church-Slavonic language in its Russian form introduced into the service of the Church.

There are several varieties, which have been regarded as species. They are annual Oriental plants, naturalized in most warm climates. Sesame was probably introduced into the U. S. by slaves from Africa. Its rich oily seeds are prized by the Negroes, who also make a thick gelatinous drink of the leaves, which is very bland and useful in diarrhoeas. The seeds can be made to yield half their weight in oil, which is in some respects better than olive-oil. The oil is called oil of benne and gingelly-oil.

Revised by CHARLES E. BESSEY.

**Sesame-grass:** a large grass, *Tripsacum dactyloides*, of the U. S. growing in moist soil near the Atlantic coast from Connecticut southward, with broad leaves and a solid stem, like that of Indian corn or sugar-cane, which it somewhat resembles. It is very coarse, and in the North is not valued, but in parts of the South and in the West Indies and Mexico is used as fodder.

**Ses'amoid Bones** [*sesamoid* is Gr. *σάμω*, sesame + suffix *-oid*, like; so called from their supposed resemblance to a sesame-seed]: bones developed in the tendons of muscles. The most familiar example is the patella or knee-pan. They do not belong to the vertebral appendages proper, but to the sclero-skeleton.

**Sesost'ris** [Gr. *Σεσωστρίης*, or *Σεσωστρίς*; cf. Egypt. *Sesetsu* = Ramses II.]: the name applied by Greek writers to Ramses II. of the nineteenth Egyptian dynasty, about whom they grouped the record of the deeds of other famous Pharaohs as well as those which belonged to himself, thus forming a single exaggerated personality. Views have differed as to the persons thus combined, Bunsen holding to a commingling of two kings of the ancient empire, while Lepsius held that Ramses II. formed the central figure. Manetho applies the name Sesostris to Usertasen II. of the twelfth dynasty, while Herodotus and Diodorus evidently have Ramses in mind. According to the Greek story, Sesostris was reared with children born on the same day, apparently 1,700 in number, and in his youth led victorious expeditions into Ethiopia and Libya. After his father's death he equipped an army of 600,000 infantry, 24,000 cavalry, and 27,000 chariots, giving the command to his fellow students, marched against Ethiopia and took heavy tribute. He then fitted out a navy of 400 vessels and sailed to the end of the Arabian peninsula. Thence he proceeded through Arabia and along the coast, crossing the Indus and conquering India. Returning by land he subdued the Scythians. According to one account he left a portion of his army in this region, and they became the ancestors of the Colchi. Then, after conquering Thrace, he returned to Egypt with great spoil and many captives, having been absent exactly nine years. The remainder of his reign occupied fifty-nine years. He divided Egypt into thirty-six nomes or districts; built roads, canals, cities, and temples, using his captives as laborers; by grace of Thoth was learned in the law, and was reckoned among the great Egyptian lawgivers; introduced the worship of Serapis; and divided the Egyptians by a system of caste, forbidding also that a son abandon the calling of his father. In his old age he became blind and took his own life. The Greek story is in accordance with the actual facts only in a few particulars. For the Egyptian account, see RAMSES. See Herodotus (ii., §§ 102-110) and Diodorus (i., §§ 53-58), and the authorities quoted by Wiedemann, *Aegyptische Geschichte*, p. 429. CHARLES R. GILLET.

**Sessa Aurun'ca** (anc. *Suessa*): town; in the province of Caserta, Southern Italy; on the crater of an extinct volcano about 6 miles from the Tyrrhene Sea (see map of Italy, ref. 6-F). Suessa was a conspicuous city of the Auronians or Auruncians as early as 418 B. C., and, judging from the position of important architectural remains, antiquarians and geologists are of opinion that the town was, in part at least, buried by a volcanic eruption. The present town is poorly built, but it has a cathedral, a theological seminary, and a technical college. Pop. 6,000.

**Sester'tius** [Lat., liter., two and a half; *se'mis*, half + *ter'tius*, third, i. e. the third (*as*) being only a half]: in ancient Rome, a silver or bronze coin worth one-fourth part of a denarius. Originally, it was worth two and a half asses, but in later times four asses made one sestertius, and the coin, originally of silver, was struck in fine bronze. The sestertium was a money of account equal to 1,000 sestertii, but it was never coined. The value of the sestertius, roughly stated, was from one and a half to five cents of U. S. money, for the value declined greatly after the fall of the republic.

**Sesto, CESARE, da**; painter; b. at Sesto, Milan, in the sixteenth century. He was a pupil or imitator of Leonardo da Vinci. He afterward went to Rome and became acquainted with Raphael, whose style he adopted. Baldassare Peruzzi engaged him to assist in executing the frescoes in the citadel at Ostia. His masterpiece is the picture in the Church of San Rocco of Milan, in several compartments. At Saronno he painted four narrow pilasters with figures of St. Martin, St. George, St. Sebastian, and St. Roch (San Rocco), which he inscribed *Cesar Magnus fecit*; this has led some critics to believe that he belonged to the de Magni family, or that these frescoes were by another painter, but the similarity of workmanship does not allow of the latter hypothesis. The date of his death is supposed to be 1524.—His brother STEFANO was a sculptor whose bas-reliefs in the Certosa of Pavia are remarkable. W. J. STILLMAN.

**Sestri Ponent'e**: town; in the province of Genoa, Italy; beautifully situated on the seashore about 5 miles W. of Genoa (see map of Italy, ref. 4-B). It has a delightful climate, and is a favorite summer resort. The inhabitants of Sestri Ponente are extensively engaged in ship-building, and are otherwise very industrious. Pop. of commune, 10,686.

**Sestus, or Sestos**: See ABYDUS.

**Sete Quedas**: See PARANÁ (river).

**Seth, ANDREW, M. A., LL. D.**: educator and philosopher; b. in Edinburgh, Scotland, Dec. 20, 1856; educated in Edinburgh, Berlin, and other universities; became assistant in logic in Edinburgh in 1880; professor in University College, Cardiff, 1883; lecturer in the University of Edinburgh 1883; professor at St. Andrews 1887; and Professor of Logic and Metaphysics in Edinburgh University 1891. His principal works are: *The Development from Kant to Hegel, with Chapters on the Philosophy of Religion* (1882); *Essays in Philosophical Criticism* (1883; edited in conjunction with W. R. B. Haldane); *Scottish Philosophy: a Comparison of the Scottish and German Answers to Hume* (first series of Balfour Lectures, 1885; 2d ed. 1890); *Hegelianism and Personality* (second series of Balfour Lectures, 1887; 2d ed. 1893). J. MARK BALDWIN.

**Seti** [*Seti meri-n-Ptah*, belonging to Set, beloved of Ptah; Gr. *Σετις*]: name of two Egyptian kings, the first and fourth rulers of the nineteenth dynasty.

**SETI I.**, son of Ramses I. and father of Ramses II. (see RAMSES), ruled for about twenty-seven years. The period just preceding had been one of weakness, in which the limits of the kingdom were narrowed from those established by Thothmes III. (See THOTHMES.) This resulted from the internal dissensions caused by the effort of KHUNATEN (q. v.) to establish the solar monotheism of Aten and to abolish the worship of Amon. Monumental proof of the return of the nation to the old religion under Seti is seen in the inscriptions and representations on the walls of the hypostyle hall at Karnak, which Seti founded. Besides this great building, he was architecturally active elsewhere in Thebes and also in many parts of Egypt. He was a patron of art, and left many monuments bearing his name, some of them undoubtedly usurped. From some of his monuments even his own name has been erased, indicating the later revulsion of the Egyptians against the cult of the foreign deity Set, in whose honor Seti was named.

Manetho marked a dynastic division between Ramses I. and Seti I., and, for reasons unknown, began a new dynasty with the reign of the latter. On obvious grounds, however, the dynasty is reckoned by some from the ascent of Ramses I. to the throne. In his first year Seti I. was compelled to proceed to Asia against the beduin (*Shasu*) and the peoples of Palestine and Syria. Among the conquered peoples the Hittites (*Kheta*) are enumerated, but the strength which they exhibited under Ramses II., the succeeding king, renders this record somewhat doubtful. Later Seti I. engaged in war with the Libyans and overcame them. Gradually they enlisted as mercenaries under Seti and his successors, till some 400 years later they had grown to such power that the Libyan Shishak usurped the throne and founded a new dynasty. Seti's inscriptions claim for him a dominion extending from Mesopotamia to Punt, Nubia, and Libya, and they show that under him the mines of Sinai and Nubia were worked. The record of his exploits is sculptured on the north wall of the hypostyle hall at Karnak. (Lepsius, *Denkmäler*, iii., 126a-130b; Brugsch, *Geschichte Aegyptens*, pp. 457 ff.; Broderick's English edition, pp. 242 ff.; Wiedemann, *Aegyptische Geschichte*, pp. 416 ff.; Lushington,

of Sutech. It was the demand of the Hyksos king Apepi addressed to the Egyptians, that they should adopt Set as their chief god, which led to the religious war that ended in the expulsion of the Hyksos by Aahmes, the first king of the eighteenth dynasty. In the Hyksos city Tanis Set was regarded as a solar deity, the enemy of the serpent Apep, whereas the general Egyptian view identified the two. Set was not only a foreign god, but came to be regarded as the god of the foreigners, and after the evils of foreign oppression had been experienced, the honor paid to him gradually ceased, till during the twenty-second and following dynasties the general detestation in which he was held is evidenced by the fact that his name was erased from the monuments and his images destroyed. He is also found as the god of the Hittites, and consequently he was regarded as the enemy of Rā, the sun-god. Set was represented in the hieroglyphics as an ass-headed figure, or as an ass seated on his haunches with a forked tail in a vertical position. The ass, crocodile, and hippopotamus were sacred to Set, and red-haired men were under his special protection. See Meyer, *Set-Typhon* (Leipzig, 1875). CHARLES R. GILLET.

**Setu'bal** (sometimes called **St. Ubes**): town; in the province of Estremadura, Portugal; on the Bay of Setubal; 20 miles S. of Lisbon (see map of Spain, ref. 17-A). It has an excellent harbor, lined with broad quays and defended by five forts. It is an old town, the *Cetobriga* of the Romans, and is surrounded by walls, but it is well built and clean. It is the chief seat of the Portuguese salt-trade, and has also an extensive trade in wine and oranges. Considerable pilchard-fisheries are carried on. Pop. 15,600.

Revised by M. W. HARRINGTON.

**Seoul**: same as SEUL (q. v.).

**Seurt**, or **Saird**: town; on the upper Tigris; in the vilayet of Bitlis, Kurdistan (see map of Turkey, ref. 5-I). It is probably the ancient *Tigranocerta*, built by Tigranes the Great (80 B. C.). It carries on trade in wheat, barley, mohair, and gallnuts. Pop. 12,000, Kurds, Armenians, Syrians, and Chaldeans. E. A. G.

**Sousse**: See SUSO.

**Sevasto'pol**, or **Sebas'topol**: seaport and fortress; near the southwest extremity of the Crimean peninsula in the Black Sea (see map of Russia, ref. 11-C). The roadstead and the harbor, and the extensive establishments connected with them, form the most important features of the place. It was a Tartar village (*Akh-tiar*) until 1780, when the Russian Government commenced the work of establishing here its naval arsenal. The great harbor fortifications which existed at the period of the siege were planned in 1834, and also at the same time land-defenses. The latter had not been constructed when (Sept., 1854) the allied armies of Great Britain and France established themselves before the place and the memorable siege commenced. Every effort was then made to increase the strength of existing intrenchments, and the process continued *pari passu* with the siege. The bastions (of earth) mentioned in accounts of the siege had been previously thrown up. The connecting lines had not the strength of ordinary field-fortifications, the scarcity of earth preventing the excavation of ditches, except about the bastions and other points of support (e. g. the Malakoff, originally a stone tower; the Redan, an earthwork, etc.). To compensate for want of ditches, every practicable expedient was adopted to render access difficult.

Though compressed into comparatively small linear space, the real magnitude of these defenses was enormous, 5,000 or 6,000 men being at some periods daily engaged on them, and the labor being unintermitted during the eleven months of the siege. The garrison during this period (always in free communication with the external forces by which it was replenished) was usually about 30,000 men; the number of guns mounted at the final assault is said to have been 800, several times that number having been rendered unserviceable in the course of the siege (Oct., 1854-Sept., 1855). The Russian loss in the defense was 84,000 men. (*Todleben*.) The forces actually engaged were, during the latter months, about as follows: French, 120,000; British, 27,000; say, 147,000 men. The Sardinians (5,000) and Turks are not included, as they were not directly engaged. The former and a portion of the Turkish force helped to hold the base (Balaklava) and communications of the besiegers. The French loss was 44,500 (*Niel*); hence the total loss of allies must have been about 60,000. The total loss of besieged and besiegers must have been nearly 150,000.

The fortifications and naval establishments were, after the capture, destroyed by the allies, and by the Treaty of Paris, which terminated the war, Russia was debarred from building arsenals and maintaining a naval force in the Black Sea beyond a very limited magnitude; but this restriction was removed by the abrogation of the neutrality of the Black Sea by the Conference of London (1871). The town has been rebuilt, and since 1885 the fortifications have been actively replaced and the docks reconstructed. Sevastopol has become a pleasant watering-place, and is Russia's greatest southern naval headquarters. It has ceased to be a commercial port since the opening of the new harbor at Kaffa (1895). Pop. (1890), inclusive of the garrison of 12,000, 41,000. See CRIMEAN WAR. Revised by M. W. HARRINGTON.

**Seven Pines, Battle of**: See FAIR OAKS.

**Seven Sages** (or **Wise Men**) of Greece: according to most authorities, Bias, Chilon, Cleobulus, Periander, Pittacus, Solon, and Thales, but the names are variously given. Many aphorisms in prose and verse, chiefly practical observations for the regulation of life, the work of these and other wise men of the antephilosophic period of Greece, have been collected in Orelli's *Opuscula Græcorum Veterum Sententiosa et Moralia* (vol. i., p. 188, seq.). J. R. S. S.

**Seven Sleepers**: according to an early tradition, seven Christian brothers of Ephesus who, during the persecution of Decius (251), took refuge in a cave, the entrance of which was walled up immediately after by the heathen. There they slept miraculously until 447. Then they awoke, told their story to many persons—among others to the Emperor Theodosius II.—and died after having thus confirmed the faith of the Christians. The Roman Catholic Church commemorates them on July 10. This legend can be traced at least as far back as the beginning of the sixth century. It is also told by Mohammed in the Koran. Kindred tales are found in various forms in the folk-lore of the East. E. A. G.

**Seventeen-year Locust**: See CICADA.

**Seventh-day Adventists**: See ADVENTISTS.

**Seventh-day Baptists**: a denomination of Christians formerly called *Sabbatarians*. They hold to the immersion of adult believers, and also to the observance of the seventh day of the week as the Sabbath, arguing that since the institution of the Sabbath at the close of creation and its formal annunciation as a part of the Sinaitic code there has always been an unbroken chain of men who have kept the seventh day of the week as a Sabbath, according to its original institution and enjoyment, and considering the introduction of the observance of Sunday, in the middle of the second century, as the first step to apostasy. Traces of the peculiar practice of observing the seventh day of the week as the Sabbath among some of the early Reformers are not few. The Sabbatarians began to attract attention in England about the time of the Commonwealth. In 1650 they assumed a denominational form in that country. The first Sabbatarian church in America was organized at Newport, R. I., in 1665, under the care of Stephen Mumford. In 1671 they left the Baptist denomination. In 1818 they assumed their present name. In the U. S. they have three colleges, one at Alfred Centre, N. Y., one at Milton, Wis., and one at Salem, W. Va., a number of academies and periodicals, a tract and publication society, and a missionary organization. The number of organizations in 1892 was 112, the number of members 9,317. In England they are at present few in number.—SEVENTH-DAY BAPTISTS (GERMAN), a small sect which in 1728 seceded from the Dunkers of Pennsylvania, and established at first a solitary, and then a conventual, life at Ephrata, Lancaster co., Pa. They hold a part of their property in common, adopt the Capuchin habit and a system of monastic names, and recommend, but do not absolutely require, celibacy. At present their leading establishment is at Snowhill, Franklin co., Pa. In 1890 there were six organizations and 194 members. Their founder was Conrad Beissel. See *A General History of the Sabbatarian Churches*, by Mrs. Tamar Davis (1851). See BAPTISTS. Revised by W. H. WHITSITT.

**Seven Up**: a game at cards known also as *all-fours* and *old sledge*. It is designed for two players and is played with a full pack, the cards ranking as in whist. Six cards are dealt each player, three at a time, and the next is turned face up. If the non-dealer is dissatisfied with this for trump he "begs," and the dealer must either immediately add one point to his opponent's score or lay the turned card aside and deal three more to each player, turning the next card for trump; but if this be of the same suit as before he must

**Severn**: a river of England which rises in Montgomeryshire at an elevation of 1,500 feet above the level of the sea, flows east, south, and then southwest, and falls into the Bristol Channel after a course of about 210 miles, though the distance from source to mouth is only 80 miles in a straight line. It is navigable for 150 miles, and the tide, which in its estuary assumes the character of the bore, locally called *hygre*, is perceptible 120 miles from its mouth. Its chief affluents are the Terne and the upper and lower Avon on the E. and the Teme and the Wye on the W. A canal 18½ miles long, and navigable for vessels of 400 tons, extends from Gloucester to the upper portion of the estuary. Other canals establish communication between the Severn and the Thames, Trent, and Mersey.

**Severus, ALEXANDER**: See ALEXANDER SEVERUS.

**Severus, SEPTIMIUS**: Roman emperor (193-211 A. D.); b. near Leptis in Africa in 146; married the famous Julia Domna, daughter of Bassianus, priest of the Sun at Emesa. While commander-in-chief of the Roman armies in Illyria and Pannonia he was proclaimed emperor by his troops. He deposed the Emperor Julianus and crushed the rival claimants Pescennius Niger and Clodius Albinus; captured Byzantium (197) after a memorable siege which lasted three years; invaded Parthia and captured Ctesiphon; from 203 to 207 remained peacefully at Rome, where he remodeled the constitution of the Pretorian Guards; was then called to Britain to repress rebellion and marched the entire length of the island, subduing the Caledonians; died at Eboracum (York) in 211, his death being hastened by the unnatural conduct of his son Caracalla. E. A. GROSVENOR.

**Severus, SULPICIUS**: See SULPICIUS SEVERUS.

**Severus, Wall of**: a wall of stone partly built or repaired by the Emperor Severus in 208 A. D. to protect Roman Britain from the Caledonians. It was originally erected by Hadrian. It extended from the Solway to the Tyne, immediately N. of the wall of Hadrian, and consequently far S. of that of Antoninus. Considerable portions of the wall still remain. See HADRIAN'S WALL.

**Sevier, sev-er'**, JOHN: pioneer and soldier; b. on Shenandoah river, Virginia, in 1745, of French parents; originally named XAVIER; explored the Holston river in East Tennessee (then North Carolina), built Fort Watauga, and fought successfully against the Indians. During the Revolutionary war he distinguished himself by his bravery. He was foremost in almost all the battles and skirmishes, as well as treaties and negotiations, with the Indians during many years, and was regarded by the settlers as their friend and protector; was chosen in 1785, without opposition, Governor of the anomalous State of Franklin, comprising Western North Carolina and Eastern Tennessee. He received from President Washington the commission of brigadier-general of the territory S. of Ohio river. In 1796 the State of Tennessee was erected and admitted into the Union, and Sevier was chosen Governor, served for two consecutive terms, and was re-elected in 1803; was elected a Representative in the U. S. Congress in 1811, and re-elected in 1813. D. near Fort Decatur, Ga., Sept. 24, 1815, while on a mission to the Creek Indians. F. M. COLBY.

**Sevier Lake**: a body of salt water in Western Utah; in lat. 39° N., lon. 130° 10' W.; altitude, 4,000 feet. Its sole tributary is the Sevier river, which enters at the north end. Its valley is a southward arm of the Sevier desert, limited at the W. by the House Range of mountains and at the E. by the Beaver Creek Range. The lake, having no outlet, is of variable size, its extent depending on the relation between inflow and evaporation. In 1872 its length was 28 miles, its width 10 miles, its area 188 sq. miles, and its depth 15 feet; but its natural size was somewhat greater, for at that time a portion of the water of the Sevier river was used for purposes of irrigation. The whole of the river is now utilized in that way through the entire spring and summer, so that little water reaches the lake except in winter. As a result its bottom generally becomes dry each year, and the water acquires in winter a depth of but a few inches. The salts which made the natural water a strong brine have been precipitated and form a crust over the lake-bottom. This crust is estimated to contain 1,500,000,000 tons, of which about three-fourths is sodium chloride and the remainder sodium sulphate and magnesium sulphate. The only inhabitants of the lake are a species of brine-shrimp (*Artemia*) and the larvæ of certain insects. Such fishes as reach it from the river are poisoned by the brine. Old water-lines

about the margin of the valley show that the lake was once of greater extent. At the time of its extreme depth, 500 feet, it coalesced with Great Salt and other lakes, the whole forming a vast inland sea. See BONNEVILLE LAKE.

G. K. GILBERT.

**Sévigé, sã'veén'yã', MARIE DE RABUTIN CHANTAL**, Marquise de: writer; b. in Paris, France, Feb. 6, 1626; was left an orphan very early, but received an excellent education from her uncle, Abbé de Coulanges, and married in 1644 the Marquis Henri de Sévigé (d. 1651), to whom she bore a son and a daughter. She was rich, spirited, beautiful, one of the most prominent members of the literary circle of the Hôtel Rambouillet, and on intimate terms with all the principal actors in the civil war of the Fronde. In 1669 her daughter, to whom she was passionately attached, was married to the Marquis de Grignan, governor of Provence; the consequent separation occasioned a correspondence which, although not intended for publication, appeared after the death of the authoress, and has made her name celebrated, the letters being at once of great historical interest and of the highest literary merit. D. at Grignan, Apr. 18, 1696. The chief edition of her *Letters* is that of Regnier (14 vols., 1662-67; new ed. begun 1887). See also Walckenaer, *Mémoires touchant la Vie et les Ecrits de Madame de Sévigé* (1842); Capmas, *Lettres inédites de Madame de Sévigé* (1876); Combes, *Madame de Sévigé historienne* (1885); the biographies by Bossier (1887) and Vallery-Radot (1888); and Saporta, *La famille de Madame de Sévigé en province* (1889). F. M. COLBY.

**Seville, sev'il** (Span. *Sevilla*, anc. *Hispalia*): capital of the province of Seville, Spain; on the left bank of the Guadalquivir, 70 miles from its mouth (see map of Spain, ref. 19-C). Under the Romans, Goths, and Moors it was the capital of wealthy and powerful empires. The earlier kings of modern Spain also resided here; and though Charles V. removed the royal residence to Valladolid, Seville rose to a still higher degree of splendor and prosperity when America was discovered, as it became the mart of the new colonies. During the French invasion (1810-13), and by the subsequent loss of the Spanish colonies, it suffered very much, but it recovered rapidly, and is an enterprising modern town. Its old Moorish walls, 5 miles in circuit, pierced by fifteen gates, and surmounted by sixty-six towers, have disappeared, except the single gate called Triana. Across the city runs the Alameda, a broad, open street lined with palaces, planted with magnificent elms, and adorned with numerous fountains, which, like the city in general, are provided with water by several great aqueducts, of which that built by Julius Caesar and rebuilt by the Moors in 1172 is a magnificent structure resting on 410 high arches. The rest of the city, with the exception of the numerous public squares and promenades, consists mostly of narrow streets lined with high, somber-looking, but substantial houses of Moorish construction. Among its edifices the cathedral is the most remarkable. It is one of the greatest Gothic structures in the world, 481 feet long, 315 feet wide, and 145 feet high under the transept dome, and it is most magnificently adorned with paintings by Murillo, the Herreras, and other masters of the school of Seville, besides being almost overloaded with sculptures. Unique of its kind is the Giralda, a belfry 350 feet high; and most interesting on account both of their architecture and ornamentation are the Alcázar, the royal palace and the university, founded in 1579. Besides the university, to which several scientific establishments are attached, Seville has many good educational institutions, and several valuable libraries and art collections. Among its manufactures are an immense cigar-factory, a cannon-foundry, several manufactories of muskets and other firearms, powder, saltpeter, soap, leather, cotton thread, etc. Its chief exports are oranges, olive-oil, wine, wool, cork, copper, lead, and quicksilver. As Seville was held by the Moors for five centuries and entirely rebuilt by them from the materials of former Roman edifices, it became a purely Moorish city, and to a certain extent it still preserves that character, though the narrow, tortuous streets are gradually giving way to broad and straight boulevards. Pop. (1887) 143,182. The province of Seville occupies the lower valley of the Guadalquivir, bounded W. by Huelva and S. by Cadiz; area, 5,235 sq. miles; pop. (1887) 544,815.

Revised by M. W. HARRINGTON.

**Sèvres, sev'r**: town: in the department of Seine-et-Oise, France; on the Seine; 10½ miles S. W. of Paris by rail (see map of France, ref. 3-F). It is celebrated for its manufactures of

came conspicuous, and from that time he was prominently connected with all the political movements of importance in the State and nation. He earnestly advocated the election of John Quincy Adams; was one of the State committee to welcome Lafayette in 1827; was elected in 1830 as an anti-Masonic candidate for the State Senate, where he labored for the improvement of schools, construction of railroads and canals, and for the collection of those documents which form the monumental *Colonial History of New York*. During the next four years he delivered frequent addresses, denouncing the course of President Jackson, and supporting the newly formed Whig party with such fervor and success that in 1834 he was nominated for Governor. In this he was unsuccessful, but on the triumph of the Whigs in 1837 he was again nominated, and was elected by a small majority. Though his administration was one of peculiar difficulties, owing to bitter factions within the party, he recommended and succeeded in carrying so many wise measures that his position in the party was much strengthened. He was re-elected in 1840. During his administration Roman Catholics were first admitted to the public schools, many of the disabilities of foreigners were removed, the natural history and geological survey of the State were begun, and the State Museum of Natural History at Albany was established. From 1843 to 1849 his activities were confined to professional practice and to occasional addresses on scholastic and political subjects. In 1849 he was chosen as a Whig to the U. S. Senate, where at once he took a position of prominence not only as one of the leaders of his party, but also as an influential adviser of President Taylor. It was in Mar., 1849, in a speech on the admission of California, that he spoke of the exclusion of slavery from all new States as demanded by "the higher law," a phrase which was so severely criticised as treasonable by Southern members that it became famous as a watchword of abolition. On the accession of Fillmore after the death of President Taylor, Seward declined to follow his party in the support of what was deemed Fillmore's pro-slavery policy. His speeches in the Senate and before public audiences during this period gave him great prominence by reason of their comprehensiveness and independence. In 1853 he favored the nomination of Gen. Scott, but opposed the statement of the party platform concerning slavery. Re-elected to the Senate in 1855, he took prominent part in the political agitations extending to the outbreak of the war. In 1858, in the course of a speech at Rochester, he coined the second of the famous phrases that are inseparably connected with his name when he declared that the slavery question indicated "an irrepressible conflict" which could only terminate by making the country either entirely a free nation or entirely a slave-holding nation. Both in 1856 and in 1860 he was the most conspicuous candidate of the Republican party for the nomination for the presidency. In 1860 the New York delegation, headed by William M. Evarts, went to the Chicago convention with much confidence that their candidate would be chosen. On the first ballot Seward received 173½ votes and Lincoln 102. The vote of Pennsylvania went over to Lincoln and other States followed. Seward, though defeated in the convention, supported Lincoln earnestly by speaking in the West as well as in the East. When Lincoln assumed office the arduous and delicate post of Secretary of State was given Mr. Seward. Though he habitually underestimated the strength and the earnestness of the South, his management of the delicate foreign relations of the Government were characterized by tact and skill. When the Confederates Mason and Slidell were taken from the British vessel the Trent, Great Britain made a peremptory demand for their restoration, and for a time war seemed almost inevitable. The answer, first drawn by Mr. Seward and then slightly modified by President Lincoln, was a masterpiece of tact and diplomatic skill. The position taken was that the exemption from search claimed by Great Britain was what the U. S. had fought for during the war of 1812 against Great Britain, and that as Great Britain had come to the position of the U. S. the Government very cheerfully released the prisoners. In all the negotiations with foreign powers to induce them to preserve a position of strict neutrality the duties of the Secretary were performed with great skill. On the evening of Apr. 14, 1865, when President Lincoln was assassinated, one of the conspirators forced his way into Mr. Seward's bedroom, where he was lying ill, and struck him several times in the face and neck with a dagger. The wounds, though severe, did not prove mortal. Recovery, however, was very slow. Seward was retained in his posi-

tion by President Johnson, whom the Secretary supported in his policy of reconstruction. After a memorable service of eight years he retired in Mar., 1869. Though much enfeebled in body he undertook with his family a voyage around the world in 1870, and published in 1871 an account of his observations. He died at Auburn, Oct. 10, 1872. His works, in 5 vols., include the most important of his speeches.

C. K. ADAMS.

**Sewell, ELIZABETH MISSING**: author; b. in the Isle of Wight in 1815; became well known as the author of novels of the so-called High Church school of fiction, among which were *Amy Herbert* (1844); *Gertrude* (1845); *Laneton Parsonage* (1846); *Margaret Percival* (1847), which were republished in the U. S. She also wrote works of travels, many volumes of a devotional character, poems, and histories of Greece, Rome, and Egypt for young people. D. in London, June 10, 1884.

Revised by H. A. BEARS.

**Sewel'lel** [from native (Amer. Ind.) name]: a rodent, *Haplodon rufus*, representing a special family, *Haplodontidae*. It is noted for its rootless molars; is reddish brown, with very small eyes and a short tail; is about the size of a muskrat, and has very strong jaws and a plump, heavy body. It is found on the Pacific coast in California, Oregon, and Washington, is gregarious, and lives in burrows. Its skin is employed by the Indians as an article of dress.

**Sewen**: See BULL-TROUT.

**Sewerage** [deriv. of *sewer* < M. Eng. *assewer*, from O. Fr. *essewer*, to drain < Lat. *ex*, out + deriv. of *aqua*, water]: a system of sewers or underground channels for carrying off the sewage or liquid refuse and the storm-water of a locality. The construction of such a system for a town is also called sewerage.

In all densely populated areas a proper regard for the health of the community requires the removal of solid and liquid refuse from the neighborhood of dwellings. Where dwellings are far apart, as in country districts, the liquid wastes from the house may be safely disposed of on the soil by very simple means; but when dwellings are crowded together, as in towns, there is no longer sufficient available open ground in the vicinity for such disposal, and sewers become a necessity. In towns where there are no sewers the sewage is run into cesspools, where it decomposes, contaminating the earth, air, and water in the vicinity, and becomes the disseminator of disease. To provide for the prompt and rapid removal of this sewage is the object of sewerage. The requisites for a sewer are that it be so constructed as to carry the sewage to its outfall with the least possible delay; that it be smooth on its interior surface, so as not to retard the flow of sewage and afford no lodging-place for the solid particles; that it be water-tight throughout its entire length.

The foremost nations of antiquity understood the necessity for sewerage, and their great cities had carefully designed and well-constructed sewers. In the ruins of Babylon and Nineveh and of the ancient cities of Egypt are found the remains of systems of sewerage. Exploration has brought to light the extensive sewers of ancient Jerusalem, and the visitor in Rome to-day sees in the Cloaca Maxima a sewer which still fulfills the purpose for which it was constructed twenty-five centuries ago.

During the dark ages sanitary works were neglected, but fatal epidemics and plagues brought thinking men at last to realize in some degree the necessity for attending to matters relating to the public health. Sanitary works were again undertaken, and with advancing civilization sanitary science has received more and more attention.

Sewers designed to carry both the liquid wastes and the storm water from any locality are called combined sewers. Those designed to carry only the sewage proper are called separate sewers.

**THE SEPARATE SYSTEM OF SEWERAGE**.—In this the first thing to be determined is the size of the sewers. The proper size of any sewer depends upon the number of people contributing sewage to it; the amount of sewage per day for each person; the maximum rate of discharge; and the form, grade, and interior surface of the sewer. In estimating the number of people provided for on any line of sewers, provision must be made for the extension and growth of towns and a liberal allowance made for an increase in the volume of sewage.

**Amount of Sewage**.—The amount of sewage per capita depends very largely upon the water-supply. It is also dependent upon the habits of the people, the amount of manufacturing in which large quantities of water are used, and

the use of water-works for electricity, etc. The volume of sewage may be provided for per day may be taken as equal to the volume of sewage collection. This volume should be distributed evenly, laid in different sewers to the same town, or sewage treatment up the use of water-works in the distribution system from 25 to 100 gal. per day per capita, and that consumption may be rapidly increasing. In many cases the consumption is 100 per cent. in 1 minute. It would not be wise to rely on a system the consumption of water in the town over 100 gal. per day per capita, and where water is used for domestic purposes and for industry a large amount must be provided for.

**Variable flow of discharge.**—The consumption of water, and hence the flow of sewage, is not constant. It varies with the different hours of the day, the days of the week, and the months of the year. The time of maximum discharge may be a different phase with the habits of the people and the climate. The daily maximum of water consumption is from 10 to 15 gal. a day, and the amount of maximum flow per hour is from 20 to 100 per cent. in excess of the average hourly consumption. The maximum daily consumption for the week is on Monday. Taking the whole year the consumption on days are two maxima of daily consumption. One of these occurs during the coldest weather in winter, and the other in the hot, dry weather in summer. The maximum daily consumption varies from 20 to 50 per cent. in excess of the average daily consumption.

The flow of sewage not being uniform, the sewers must be made large enough to provide for the maximum flow. On the other hand, any unnecessary size is a serious detriment to the efficient working of the sewer. Any increase in size of sewerage, the amount of sewage remaining the same, decreases the depth and velocity of flow of the sewage, and hence its transporting power and efficiency.

The following table shows the comparative depth and velocity of flow in circular sewers of different sizes, laid on the same grade and carrying the same amount of sewage:

| SEWER SIZE | Depth of flow (ft.) | Velocity (ft. per sec.) | Discharge (cu. ft. per sec.) |
|------------|---------------------|-------------------------|------------------------------|
| 12 in.     | 2.50                | 1.47                    | 14.0                         |
| 15 in.     | 1.62                | 1.20                    | 14.0                         |
| 18 in.     | 1.30                | 1.00                    | 14.0                         |
| 24 in.     | 1.00                | .70                     | 14.0                         |

The following table shows the comparative velocity and discharge of a circular sewer at different depths of flow. The depth is given in fractions of the diameter, and the velocity and discharge are given in fractions of the velocity and discharge when the depth is the diameter of the sewer.

| Depth of flow | Velocity | Discharge | Depth of flow | Velocity | Discharge |
|---------------|----------|-----------|---------------|----------|-----------|
| 0.10          | 0.144    | 0.0007    | 0.80          | 1.0000   | 0.4082    |
| 0.20          | 0.289    | 0.0028    | 0.70          | 0.9822   | 0.3742    |
| 0.30          | 0.434    | 0.0062    | 0.60          | 0.9644   | 0.3402    |
| 0.40          | 0.579    | 0.0106    | 0.50          | 0.9466   | 0.3062    |
| 0.50          | 0.724    | 0.0160    | 0.40          | 0.9288   | 0.2722    |
| 0.60          | 0.869    | 0.0224    | 0.30          | 0.9110   | 0.2382    |
| 0.70          | 1.014    | 0.0300    | 0.20          | 0.8932   | 0.2042    |
| 0.80          | 1.159    | 0.0386    | 0.10          | 0.8754   | 0.1702    |

**Velocity.**—A certain velocity of flow is required in a sewer to prevent deposit. The minimum velocity to prevent deposit varies with the size of the sewer, and is from 2 to 4 ft. per second. The following table gives the minimum velocity minimum for self-cleaning sewers, running half full.

| Size of pipe | Velocity (ft. per sec.) |
|--------------|-------------------------|
| 12 in.       | 2.00                    |
| 15 in.       | 1.75                    |
| 18 in.       | 1.50                    |
| 24 in.       | 1.25                    |

Where, in extreme cases, sewers may be laid with a lower grade than that indicated above, it is always at the risk of accumulation, backing and ultimate stoppage.

In locations where the surface of the ground is nearly level and uniform grade can not be obtained to dispose of the sewage by gravity, the sewage may be carried to its outlet by utilizing the force of the pneumatic processes. The main force employed in the pneumatic processes are the vacuum, suction, and blow.

In the vacuum and blow systems the sewage is carried through an tight iron pipe by atmospheric pressure. The air being exhausted from the pipe by large air-pumps.

In the blow system the sewage is raised from a lower to a higher level by being admitted to a revolving chamber or

revolving wheel, and then forced by centrifugal action out of the chamber and to the elevated elevation where it again enters through the sewerage by gravity.

Also ordinary hydraulic formulas for the flow of water in pipes will apply to sewage. The amount of sewage which any pipe will carry depends upon its velocity. The following formulas are among the best in use:

$$\text{Weisbach's formula } v = \frac{1.486}{n} \sqrt{R S}$$

in which  $v$  = velocity of flow in feet per second

$R$  = hydraulic mean radius

$S$  = slope of pipe in feet

$n$  = coefficient of resistance for materials of water

into the pipe

$C$  = coefficient of friction in the pipe

Baldwin, lecturer in his *Sanitary Engineering* gives tables of values for the coefficient, and extensive series of definitions for different sizes pipes at different inclinations according to Weisbach's formula.

Kutter's formula is

$$v = \frac{1.486 + \frac{1.486}{n} + \frac{1.486}{S}}{1 + \left( \frac{1.486 + \frac{1.486}{n}}{S} \right)^{0.5849}} \sqrt{RS} = C \sqrt{RS}$$

in which  $v$  = mean velocity in feet per second

$C$  = coefficient of mean velocity

$S$  = slope of pipe

$R$  = hydraulic mean radius

$n$  = coefficient of resistance to flow, determined by experiment.

Flynn's hydraulic table are based on this formula.

The most rapid method of determining the necessary size of sewers under given conditions is from diagrams or graphical tables. Pearson's graphical calculations, published in *Staley and Pearson's Sewerage System at New York*, give results for pipe-sewers by both Weisbach's and Kutter's formulas.

**Material for Pipes.**—The best material thus far produced for pipes up to 2 feet in diameter is vitrified, glazed, earthenware pipes. Sewers more than 2 feet in diameter may be constructed of brick, stone, or concrete. Sewer-pipe is sometimes made of hydraulic cement. Pipe of excellent quality can be made of this material, but it is difficult to secure uniformity of quality. Vitrified earthenware pipe has a smooth surface, is impervious to moisture, is not affected by sewage, and does not deteriorate with time. It is made of all sizes up to 2 feet, and special forms are manufactured for certain purposes. It is usually made of cylindrical form, and in lengths of 2 or 3 feet. In the usual form each length has a bell, or socket, at one end to hold the spigot end of the adjoining piece in laying. This is called the bell and spigot joint. Another method of making the joints is to make the pipes plain cylinders, and provide separate collars to slip over the joints where the pipes meet. A hand-hole is a length of pipe with a detachable section, which can be removed at any time after the pipe is laid without disturbing the line of pipe. Joints are formed by Y or T branches. The T-branch is a socket on the side of a pipe to receive a branch at right angles. The Y-branch is a socket made to receive a branch at an acute angle. Curved pipes are prepared for turning bends. Junctions of laterals with mains, and of house-sewers with street lines, should be made with Y-branches. Fig. 1 shows in plan and elevation a junction. The Y should be elevated so that the curved pipe, joining the Y with the lateral, will bring the top of the branch sewer as high or higher than the top of the main sewer.

Sewers more than 2 feet in diameter are usually built of hand-turned brick, laid in hydraulic cement. All junctions for lateral branches and house-connections should be put in when the sewer is built, as much better workmanship can then be secured in making the connections, and with less danger to the sewer.

**Location.**—Sewers may be located either in the streets or, where alleys are regularly laid out through the center of the blocks, in the alleys. When only one line is laid in a street it should be on the center line. In some cases, where the streets are wide or the center line is occupied by street-railway tracks, it may be advisable to put a line of sewers on each side of the street.

**Depth.**—The sewers should be far enough below the bottom of the cellars, to afford sufficient fall for the house-drains starting from beneath the cellar floor. The minimum depth will usually be from 6 to 8 feet.

ELEVATION

PLAN

FIG. 1.

**Laying.**—In laying the sewers care should be taken to keep the flow-line on a continuous grade, and to make the joints water-tight. The joints should first be caulked with a gasket of oakum, or some similar material, to prevent the entrance of cement to the inside of the pipe, and the joint filled with pure cement, mixed with sufficient water to make it of the proper consistency for working. Y-branches should be placed along the line of sewers in front of each lot, so that house-drains may be connected at any time without cutting or disturbing the main line of sewers. The opening of the Y-branches should be closed with an earthenware cover.

**Manholes** are masonry shafts extending from the sewers to the surface of the ground, and large enough to admit a workman to inspect or clean the sewers. They are usually formed of an 8-inch brick wall. The form is the frustum of a cone with the large end down. The top should be about 2 feet in interior diameter, and the bottom about 4 feet. The form at the bottom is sometimes elliptical. The top is finished by a cast-iron cap, level with the surface of the street. The cover is perforated to aid in ventilation. Sometimes a dust-pan is placed under the cover to catch the dirt which falls through the openings in the cover.

The bottom should be of concrete, and built so as to be water-tight. It should be formed to the contour of the invert of the sewer, so that the flow of the sewage will not be checked in the manhole. Steps should be built into the wall to facilitate getting in and out. Fig. 2 is a vertical section of a manhole at right angles to the axis of the sewer. Manholes should be placed at the junctions of the laterals with the mains, and at changes of direction in the line of sewers.

**Lampholes**, or observation openings, are formed by a T-branch extending from the sewer to the surface of the ground. The top of the vertical pipe is covered with a cast-iron cap having a movable cover level with the pavement. Sometimes the vertical pipe is not carried to the surface, but is capped below the pavement and its position carefully recorded.

FIG. 2.

The advantage of this method is that each section between the manholes is independent of the rest of the system, and any stoppage in one section will not affect any of the other sections.

**Size of Combined Sewers.**—In determining the size necessary in any case, the disposal of the storm-water is the only question to be considered. The ordinary flow of sewage is

so small compared with the volume of storm-water delivered to the sewers during and immediately after a storm that the sewage may be left out of consideration. In estimating the necessary size the following conditions must be taken into consideration: The area to be drained; the rate of rainfall; the percentage of the rainfall reaching the sewer; the grade of the surface of the ground; the grade of the sewer; and the amount of ground-water.

Sewers are rarely built large enough to provide for all of the water which falls in extraordinary storms lasting only a short time. Besides this, not all of the rainfall reaches the sewers. The percentage of that which does pass into the sewers depends upon the relative proportion of roofed and paved area to the whole area to be drained, and the nature of the soil of the unpaved part. The grade of the natural surface of the ground affects the rapidity with which the storm-water reaches the sewer. It is customary to assume a certain depth, varying from half an inch to 2 inches per hour, as reaching the sewer, although the rainfall may occasionally be several times that amount.

Different formulas have been proposed for determining the size of sewers. The following are some of these. Julius W. Adams's formulas:

$$D = \sqrt[3]{\frac{QL}{1542H}}$$

in which  $D$  = diameter of sewer in feet.

$Q$  = cubic feet per second to be provided for.

$L$  = length of sewer.

$H$  = rise for length  $L$ .

$$\log D = \frac{2 \log A + \log N - 3.79}{6}$$

in which  $D$  = diameter, in feet, of sewer.

$A$  = acres to be drained.

$N$  = length in feet in which the sewer falls 1 foot.

These formulas are on the basis of 1 inch of rain per hour, half of which reaches the sewer within the hour.

Thomas Hawksley's formula, used in the main drainage of London:

$$\log \text{diameter of main (in inches)} = \frac{3 \log A + N + 6.8}{10}$$

in which  $A$  = acres drained.

$N$  = length in feet in which the sewer falls 1 foot.

This is on the basis of 1 inch of rain per hour.

The principal difference in the various formulas is in the assumption of the amount of water which the sewer is to provide for. They are never built large enough to carry all of the water of the heaviest rainfall. Having decided the amount of water which the sewer is to carry, the size may be calculated by the formulas previously given for the flow of sewage in pipes.

**Form of Sewers.**—If a sewer has an approximately constant flow and is to run half full or more, the best form is circular. In combined sewers, however, the ordinary flow of sewage usually fills but a small part of the cross-section of the sewer, and in that case the egg-shaped section with the small end down is best. This concentrates the flow in the bottom of the sewer, so that the depth and velocity of flow may be kept as great as possible when the quantity of sewage is at its minimum, and by expanding in the upper part provides for the greatly increased amount delivered to the sewers by storms.

Fig. 3 shows one of the many forms of egg-shaped sewers. The vertical diameter  $AB$  is one and a half times the greatest diameter  $CD$ .  $CAD$  is a semicircle described on  $CD$ . The lower arc is described with a radius equal to one-fourth  $CD$ , and the sides are described with a radius equal to the vertical diameter. The shaded portion at the bottom of the figure shows the relative depth, and hence velocity, of the same amount of sewage in a circular and in an egg-shaped sewer of the same capacity.

**Manholes.**—The manholes for the combined system differ from those in the separate system, as shown in Fig. 2, only in resting on the sewer itself instead of a concrete founda-

FIG. 3.

case. The construction of the manhole begins at the spring, or lowest support point, of the sewer.

**General design.**—The sewer water in passing over the surface of the manhole and along the gutter carries with it not only mud, stones and trash, but also sewage and other refuse. In order to keep the surface out of the gutter the manhole is first covered and then a construction, across the solid matter, is built over the water, passing on into the sewer. This opening into the sewer should be secured just from the bottom, and should be so arranged as to prevent any admittance of any of the solids from the catch basin.

FIG. 4.

On either side of the partition, the gas from the sewer can not escape. Therefore the outlet to the sewer is trapped.

Water closets should be cleaned frequently, as the organic matter carried into them by sewage will decompose and become offensive. They should be placed at the lowest points, and have still to them back up at on both sides of the street.

Sometimes when combined sewers are built provision is made for purifying the ordinary flow of sewage, but not the much larger volume of storm-water.

In that case a storm overflow is arranged, as shown in Fig. 5. It depends for its action upon the fact that an increase in the depth of flow in a sewer will increase the velocity.

FIG. 5.

As the flow deepens in the sewer, the velocity increases until it is sufficient to keep the opening *B* and pass out through the storm-water overflow *A*.

**Flushing and Ventilation.**—In order to keep sewers in the best possible condition and reduce the evolution of noxious gases a continuous provision should be made for flushing and ventilation. In the separate system, with its comparatively small pipes this is not difficult. With an open flow sewerage, on the other hand, there is always a tendency to form obstructions on the bottom of the sewer on account of the formation of the mud under the sewage. It needs a rush of water to dislodge the tongue and carry along the sediment. On discharging into the sewer the flow ceases from the bottom of a flat house near the head of each lateral sewer, for there can be no circulation whenever there is no down-catch. Sewers may also be flushed by making a connection between the upper ends of the laterals and the main supply line, water to the town, and admitting the water into the sewer by turning a valve, or by taking the water from an elevation and conducting it to the sewer through a pipe. Where there are no waterworks, flush-tanks mounted on wheels have been used. In some cases underground sewers are provided to connect the house sewers, and when full they discharge automatically.

The best method is to place at each dead end an automatic flush tank supplied with water from the water works. Sewers can be so arranged as to be flushed as often as they are thought desirable. A good form of flush-tank is shown in Fig. 6.

It is built of brick and is hermetically sealed, and provided with cement joints and is, so as to be water-tight. The top is finished with a cast-iron cap, provided with a special-like perforated cover. Water is supplied to the tank from

FIG. 6.

the pipes of the water-works, and the tank is adjusted so to fill the tank as often as is desired. The tank is supplied with an automatic emptying device, which discharges the water into the sewer whenever the tank is full. There are several devices for this purpose. A water cylinder connected to the tank should hold about 200 gal., and should be set so as to discharge in twenty-four hours.

**Ventilation of Sewers.**—Separate sewers are best ventilated by continuing the house-drain, untrapped, above the roof of the house, either inside or outside of the house. If the tubes in the manhole and flush tank covers are kept open, and the sewers are properly flushed, the air in the sewers will be changed so frequently that comparatively little trouble will be experienced from noxious gases from separate sewers.

In combined sewers the case is very different. The difficulties in the way of flushing and ventilating large sewers are almost insurmountable. The interior surface of large sewers is rough and becomes covered with organic matter from the sewage which is constantly undergoing decomposition. During storms, debris and the latter from the streets is swept into the sewers, and when the flow ceases to the usual dry-weather volume the debris from the streets is stranded and forms obstructions to the shallow, sluggish stream, formed by the sewage proper in the large sewer. Pools of sewage are formed along the line, and the decomposition of the organic matter in these pools produces enormous quantities, and affords a breeding ground for bacteria. To flush such a sewer thoroughly is usually impracticable, as it requires too much water. Sometimes an attempt is made in this direction by pumping up the sewage for a time and then releasing it, producing a current strong enough to carry forward the sediment. This improves the lower flow of sewers, but is not applicable to the upper ones. Where this method is applied there is always danger of a deposit on the line above the temporary dam.

Since the evolution of sewer-gases can not be avoided, the question of ventilation becomes the more important. Several plans have been proposed for the ventilation of large sewers, but none have been as successful as could be desired. High chimneys have been used, and in some cases a draught has been secured by means of a fan or blower. Owing to the many openings into the sewer, and chimney will afford only a limited action of the sewer. Another plan is to purify the air from the sewer by passing it through charcoal filters.

Fig. 7 is a manhole fitted with a charcoal filter for purifying the air from the sewer. It consists of a sheet-iron cylinder, open at both ends, containing a series of pans with perforated bottoms, placed one above another and filled with charcoal. The upper of the manhole is water-tight, to exclude moisture from the filter, and a separate chamber with a perforated cover is built inside the manhole to pro-

vide an escape for the air. The charcoal is about 3 inches deep in the pans. It is renewed about once a month by being returned in retorts from which air is excluded.

**Plans.**—The design for a system of sewers for any town depends upon local circumstances. No one system, however well adapted for a given locality, will be universally applicable. The separate system is to be preferred where the storm-water can otherwise be provided for, or where the sewage must be pumped, or where sewage disposal-works are necessary, and its cost is a small fraction of that of combined sewers for the same locality. In some cases in addition to the small sewers, special conduits for storm-water are needed for a limited area. These need not be placed deep in the ground, and they can be discharged into the nearest natural watercourse, even within the town, where sewage could not be discharged.

FIG. 7.

**Disposal of Sewage.**—After the sewage has been collected and carried away from a locality the problem of its disposal remains to be solved. It may be discharged without purification into a stream or large body of water; it may be partly purified by subsidence, or filtration, or chemical process, or by a combination of these, and then discharged; or it may be purified by application to the soil in several ways. When sewage is emptied into a large stream or body of water its disappearance is due to several causes. It is diluted by the large volume of water into which it is discharged; part of the impurities are deposited by subsidence; part of the organic matter becomes food for aquatic plants and animals; and part of it is destroyed by oxidation and nitrification. So long as the amount of sewage is very small in comparison with the volume of water into which it is discharged, this method may not be objectionable, unless the stream receiving the sewage is to be used for water-supply. The pollution of streams and lakes by sewage is a growing evil. In many countries in Europe it has been forbidden by law, and in the U. S. such laws are imperatively required in order to preserve sufficient unpolluted water-supply for the large towns.

When sewage is purified by subsidence it is collected in tanks and allowed to stand until the particles in suspension are deposited on the bottom of the tank, when the partly clarified liquid is drawn off. Sieves and filters are also employed for purifying sewage. Chemical processes of many kinds have been used. In these processes certain chemicals are mixed with the sewage, and it is purified by the precipitation of the suspended impurities, and some of those held in solution. All of these methods remove the suspended impurities and the organic matter from the sewage to a greater or less extent, but the effluent is still unfit to be turned into the natural watercourses.

A still more efficient method of purification is by applying the sewage to the soil. This may be done by broad irrigation, intermittent filtration on limited areas, or by sub-surface irrigation. Where broad irrigation is employed the ground is first underdrained and the sewage is applied to the surface by leading it in furrows. The method of application depends upon the crop under cultivation. Sometimes it is spread over nearly all of the surface for a time, and sometimes it is only run in the furrows, placed from 2 to 4 feet apart. The sewage is absorbed by the soil, and wherever the sludge accumulates it is spaded under. The city of BERLIN (q. v.) has an excellent system of sewage farms.

Where the method of intermittent filtration is employed, filter-beds of soil are prepared with the sole object of filtering the sewage, and no attempt is made to raise any crop. The sewage is applied to the filter-beds in succession, time being given between the applications for the aëration of the soil. In sub-surface irrigation the sewage is delivered to the soil through drain-tile laid from 6 to 10 inches below the surface of the ground. The sewage passes out of the tile at the joints, and is absorbed by the soil. This method is especially applicable on private grounds, where no sewers

are available. The action of the soil in purifying sewage is somewhat complicated. It filters out the suspended particles, and the organic matter in the sewage is destroyed by oxidation and by the bacteria in the soil. The effluent water is collected by drain-tile and delivered to the natural watercourses.

For further information, see Latham's *Sanitary Engineering*; Adams's *Sewers and Drains for Populous Districts*; Staley and Pierson's *Separate System of Sewerage*; and Baumeister's *Cleaning and Sewerage of Cities*. See PLUMBING. CARY STALEY.

**Sewing-machines** [sewing is pres. partic. of *sew* < M. Eng. *sewen*, *sew* < O. Eng. *seowan* < O. H. Germ. *siuwan* < Icel. *siya* < Goth. *siujan* < Teuton. *siu-* < Lith. *siuti* < Lat. *su* < Gr. *κασ-σθαι*]; machines for stitching fabrics, operated by the foot, hand, or other motive power.

In 1790 Thomas Saint, an Englishman, secured a patent for a machine intended for "quilting, stitching, and sewing, making shoes and other articles." This machine, although made chiefly of wood, had many features similar to those common in modern sewing-machines, such as the overhanging arm, a vertical reciprocating needle-bar, having secured in its lower end by means of a set-screw a straight needle with a terminal notch instead of an eye. There was also, at a short distance from the needle, a straight awl to make the holes through which the thread was to be pushed by the notch-ended needle. On the top of the needle-bar was a large spool, from which the thread was drawn as required to form the stitch. This machine also had what is now called a feed, for moving the material after each stitch the proper distance for the next, and thread-tighteners (tensions) above and below it. The stitch used by Saint was known as the tambour stitch (now called the chain stitch)—the continuous thread was pushed by the notch-ended needle through a hole made by the awl, and the needle was then withdrawn, leaving a loop of thread below the material, which was then moved by the feed the proper distance for the next stitch, a second loop being formed passing through the first, which was then drawn tight.

At intervals in the first half of the nineteenth century machines for embroidering and ornamental stitching were invented. These could have been made to fasten two or more pieces together, but they were not intended for that work, and therefore can not with propriety be called sewing-machines. Several machines were also patented for making a running stitch, by means of fluted rollers which folded the cloth in short vertical convolutions and forced it on to a horizontal needle. Such machines used needles full of thread, and the needle was threaded in the ordinary way. In 1818 the Rev. John Adams Dodge, of Monkton, Vt., invented and (with the assistance of John Knowles, a mechanic) constructed a sewing-machine which made a back stitch in a satisfactory manner, but it was never patented or manufactured for sale.

The first sewing-machine that was manufactured for sale was patented in France in 1830, and in a modified form in the U. S. in 1850. Its inventor, Barthélemy Thimomier, constructed of wood eighty machines which made a chain stitch of such strength that they were used in the year 1830 for manufacturing army clothing. These machines were destroyed by a mob which alleged that they were depriving tailors of their bread. A few years later Thimomier had other machines constructed of metal, which were driven by a treadle and cord. These were also destroyed. Thimomier's machine anticipated many of the more important features of the machines of to-day. It had the overhanging arm, flat cloth-plate, vertical post, vertical reciprocating-needle, continuous thread, and a presser-foot.

**The Hunt Machine.**—About 1832-34 Walter Hunt, a New York mechanic, invented, manufactured, and sold a few sewing-machines which were successfully operated. His machine had a curved needle with an eye near its point, attached to the end of a vibrating arm. It used two continuous threads, the lower being wound on a bobbin carried in a shuttle, and made a lock stitch—i. e. one in which the thread from the needle and that from the shuttle are interlocked at or near the middle of the thickness of the materials being sewn. Hunt neglected to apply for a patent for his invention for about twenty years, and during that time the manufacture and sale of the machine was not prosecuted; his tardy application for a protecting patent was denied on the ground that he had forfeited his rights by neglect and the sale and public use of the machine at the

was at all improved. In 1842 J. I. Henson patented a machine for knitting hosiery and other knitted fabrics. This machine had a needle pointed at each end and any of its needles could be passed in and out through holes in the material by the material by an awl, and was consequently manufactured by putting on each side of the frame. This machine might make either a back stitch or a forward stitch, as the position of the needles. The needles used were kept in of forced and required frequent adjustment of the machine for reknitting. Henson's machine has not come into extended use.

In 1844 a sewing-machine somewhat similar to Henson's was invented by George H. Charles (later an inventor in the automobile) but it used two needles with eyes near the points which were thrust horizontally through holes in the material by rods in the material to be sewed, which were connected between the frame, and automatically moved at right angles to the path of the needles. The feed was automatic, and all the movements were derived from suitably arranged gears on a central shaft.

**The Howe Machine.**—In 1846 a patent was issued to Elias Howe, Jr., for a sewing-machine in which he had been experimenting for three years. It had a curved needle with an eye near the point attached to the end of a vibrating shuttle which carried the upper thread, the lower thread being wound upon a bobbin in a shuttle which was made to pass between the needle and the thread at each vibration of the needle. The shuttle was suspended on pins projecting from the edge of a plate, called a hump plate, provided with perforations in which worked the teeth of a small pinion of which the hump plate was given an intermittent movement of "back" after each stitch. When the machine was started, it was found to be automatic. The chief advantages experienced in constructing it were these: The hump plate wanted no adjustment as a "feed," the vertical suspension of the needle was awkward and unmanageable, and the hump plate had to be replaced to prevent the slipping of stitches, necessitating of large jumps in some places, and the drawing of the needle and thread to others.

Between 1846 and 1851 several inventors attempted to make sewing-machines of more practical value. Moses Brown and Abner C. Smith made a machine which was used to a limited extent in the manufacture of clothing. This had a curved needle, with pins for a hump plate, the shuttle being suspended from a rotating rod in a circular frame. The foot was adjustable, and the hump automatic. James M. May and John M. and John Bachelder constructed a machine for making the loop or chain stitch, and some years later in the U. S. patent made that stitch.

**W. & W. Machine.**—In 1849 Allan H. Wilson of the Glasgow firm of Wheeler & Wilson made and in 1850 patented a sewing-machine having a vibrating shuttle, and the hump plate of a hump plate afterward patented as his hump plate. This machine had a considerable sale, but was not satisfactory to its inventor, who set himself to work to produce something more practical. His efforts resulted in the invention of the rotating hook patented Aug. 12, 1854, which differed widely in its simplicity, a double-concave circular bar with a ring which held it in place. This hook caught thread from the descending curved needle, whose eye was not a point, and passed it around the hub, thus its sewing with the shuttle. Wilson afterward perfected the mechanism foot and other details.

**The Singer Machine.**—In Sept., 1850, Isaac M. Singer, an emigrant from New York, who had become interested in mechanical experiments and was familiar with the most advanced foreign machines made a contract to invent an

FIG. 1. Sewing Shuttle

improved sewing-machine and have it built for \$40. He was paid this within twelve

months and the machine was found to be practical and efficient. It was the first which had the rigid frame, and the needle, the vertical needle, its construction, the hump plate, and what was called a hump foot. A patent for this machine was issued Aug. 12, 1851. At about this time W. & W. received a contract of the firm of Crocker & Sewell, Boston, was attempting the solution of the sewing-machine problem to a different solution.

**The Crocker & Sewell Machine.**—On Feb. 11, 1851, Messrs. Crocker & Sewell presented a sewing-machine making what

has been called the Crocker & Sewell machine, which was made by a combination and joint action of a shuttle communicating under needle with a curved upper needle having an eye near the point, then disposing with horizontal and vertical, and enabling both the upper and under threads to be taken from conical spools. These machines were very popular and for several years took the lead of all others, but they are no longer manufactured. Although up to this time Elias Howe, Jr., had never made a machine sewing-machine, his patents were so skillfully drawn that Crocker & Sewell, Singer, and Wheeler & Wilson were obliged to pay him royalty which amounted to \$25 per machine, but in 1854 an agreement was entered into between the above-named manufacturers and Howe by which the royalty was considerably reduced to them, but under it manufacturers outside "the combination" use the quadruple syndicate was obliged to pay a heavy royalty. Howe's patent was extended in 1860 for the term of seven years, at the expiration of which he again applied for a further extension; but, as he acknowledged that he had received between \$1,000,000 and \$2,000,000 for the use of his invention, it was thought that he had been sufficiently remunerated and his application was rejected.

Prior to the final expiration of Howe's patent (1867) but few machines for making the lock stitch had been invented and manufactured except by "the combination."

**The Wheeler & Wilson Machine.**—In June, 1857, James F. A. Gillies of Millpoint, N. H. took out his first patent for a machine having a rotating hook for using a single thread to make the twisted loop stitch, a variety of the chain or tambour stitch which possesses much merit. This, with other improvements of its details by James Wilson, of Philadelphia, became the Wilson & Gillingham machine, the most popular of the single-thread machines. Several years later the machine was improved by Charles H. Wheeler, who invented an automatic tension which readily adapts itself to the requirements of sewing thicknesses of cloth, seams, folds, etc., and draws the stitch equally tight under all conditions.

At the expiration of Howe's patent in 1867 a large number of new machines were brought out, but few of them are in use.

**Button-hole Machines, Leather-sewing Machines, etc.**—There have been two machines and two attachments invented for finishing button-holes by the button-hole stitch—viz., the Union button-hole machine, made by the Singer Manufacturing Company, and the Howe or Wheeler & Wilson button-hole machine; the American button-hole and the Wheeler & Wilson button-hole attachments. A multitude of other accessories and attachments to sewing machines, such as hammers, breakers, cutters, rippers, pliers, pressers, binders, quilters, rufflers, and gatherers have been invented for the purpose of executing special kinds of work with facility, and the total number of patents issued for sewing machines and their adjuncts is a record of 4,000.

Among the more important inventions for sewing to one class may be mentioned machines for sewing button gussets with mixed thread. Of these, the Lyall No. 1 and the Keene lock-stitch machines, the McKay chain-stitch machine and the Goodhue & M. Kay sewing-machine are the most prominent. Each of these machines has been largely used in the manufacture of boots and shoes, harness, and other articles made of leather. Machines have also been invented for sewing books; of these, the Smith and the Scribner are the best known.

**Classifications of Machines.**—Sewing-machines are best classified by the kind of stitch produced, and although a great number of entirely kinds of stitches and machines for making them have been invented, yet there are at the present time but three types of stitches used in machine-sewing—viz., the lock stitch, the chain stitch, and the button-hole stitch.

Lock-stitch machines may properly be divided into two types—those making the lock stitch by means of a shuttle which is thrust through the loop of the upper thread and those in which that loop is carried by a revolving hook over a stationary bobbin. More than half of the machines now manufactured are of the first-named type, of which the Singer and Wheeler machines are the chief examples. The Wheeler & Wilson machine being the original and still by far the most prominent of the revolving hook type of lock-stitch machines. These machines are all made on the "interchangeable principle," each part being exactly like its corresponding part in every machine; and in such perfection is this system

carried that the machines are assembled by selecting their component parts at random from the hundred or more receptacles containing them. This interchangeable method of construction is adopted by all sewing-machine manufac-

FIG. 2.—The lock stitch.

FIG. 3.—Grover &amp; Baker stitch.

FIG. 4.—Twisted loop stitch.

FIG. 5.—Button-hole stitch.

turers, and by its use the business can be thoroughly systematized and the manufacture be carried on at a minimum cost.

The revolving hook used in the Wheeler & Wilson sewing-machine has been much modified and improved; that at

FIG. 6.—Domestic shuttle.

present used in their No. 9 machine is represented in Fig. 7. A greater possible rate of speed is claimed for these machines than

for those which employ a shuttle; a further advantage is found in their running with less noise.

A variety of rotating-hook lock-stitch machine, and one which embodies an entirely new departure in sewing-machines, is the invention of Mrs. Harriet Ruth Tracy. It has a rotating bobbin-holder provided with three hooks, which in turn operate to carry the loop from the upper thread over the bobbin-holder, and a bobbin or cop containing 1,000 yards of thread. The special features of this machine are: (1) its large thread-carrying capacity in the bobbin-holder; (2) the fact that it has no take-up above the bed, the three rotating hooks disposing of all the slack (a feature which permits a large amount of thread to be carried); and (3) the rotating positive motion of the entire mechanism, which allows of very rapid running. In five seconds, by a slight change of adjustment, this machine can be made to take a chain stitch with a single thread or a chain stitch having a second or locking thread run through it on the under side of the cloth, which prevents raveling and at the same time

FIG. 7.—Wheeler &amp; Wilson bobbin and bobbin case in the rotary hook.

leaves the stitch elastic. The machine is characterized by simplicity and great ingenuity.

The twisted loop or chain stitch is made only by the Willcox & Gibbs machine. A short straight needle is carried by a vertical reciprocating bar, actuated by a vibrating lever, put in motion by a link connecting it to an eccentric on the main shaft of the machine. At the front end of the main shaft is a peculiarly shaped hook, which in its rotation catches the upper thread as the needle, having an eye near its point, descends through the cloth, and forms a loop through which the needle passes on taking the next stitch;

the hook then engages the upper thread again, and at the same time the first loop is thrown off the hook and the first-named stitch drawn tight by the operation of forming the

FIG. 8.—The Tracy circular three-pointed rotary-shuttle with bobbin placed inside its case ready for use.

second loop. This machine is practically silent in its operation, even when running as rapidly as to make 3,000 stitches per minute.

The button-hole sewing-machines do their work in a thoroughly efficient manner, the button-hole finished by it being much more durable than those made by hand-work. Button-hole attachments are intended to be used in connection with an ordinary lock-stitch sewing-machine; they not only make a perfect button-hole, but will also make the button-hole stitch on the edges of garments, shoes, etc., which the button-hole machine can not do.

Besides those already enumerated, there is a large variety of sewing-machines manufactured for doing special work. Among them are the cylinder sewing-machine, having a cylindrical work-holder, for sewing seams on sleeves, trousers, water-hose, boot-legs, leather buckets, and other articles of tubular form; and the carpet sewing-machine, for making up carpets.

The operations required for the manufacture of a sewing-machine are very numerous, embracing designing, drawing, pattern-making, casting, pickling, tumbling, tool-making, forging, annealing, stamping, swaging, filing, polishing, screw-making, turning, drilling, plating, japanning, ornamenting, assembling, testing, and packing. For the manufacture of sewing-machine needles, see **NEEDLES AND NEEDLE-MAKING**.

There are but two sewing-machine factories in which all parts of the machine, including cases and needles, are manufactured. The manufacture of sewing-machine needles and cases has reached large proportions as independent industries. The census returns of 1890 showed that 59 establishments manufacturing sewing-machines and attachments reported. These had a combined capital of \$16,043,136, employed 9,121 persons, paid \$5,170,555 for wages and \$3,502,173 for materials, and had products valued at \$12,823,147. There were also reported 7 establishments manufacturing sewing-machine cases, which had a combined capital of \$1,430,403, employed 1,842 persons, paid \$886,725 for wages and \$990,439 for materials, and had products valued at \$2,249,551.

**Sexage'sima** [= Late Lat. (sc. *di'es*, day), liter., fem. of *sexage'simus*, sixtieth, deriv. of *sexagin'ta*, sixty]: in the calendar the eighth Sunday, nearly sixty days, before Easter. See **SEPTUAGESIMA**.

**Sextant** [from Lat. *sex'tans*, *sextan'tis*, the sixth part of an as, also a sixth of certain other measures of land, length,

**Seyffarth**, zif'fäart, GUSTAV, Ph. D., D. D., LL. D.: scientist and archaeologist; b. at Uebigau, Prussian Saxony, July 13, 1796; educated at Leipzig University, where he was Professor of Oriental Archaeology from 1825 to 1855; professor in the Concordia Lutheran Theological Seminary at St. Louis, Mo., 1855-71, and afterward took up his residence in New York. He was the author of numerous works in German and Latin upon theology, Oriental philology, mythology, history, and chronology, chiefly notable for their extreme advocacy of the literal school of biblical interpretation and their entire rejection of the system and results of the Egyptian researches of Champollion and Bunsen. He resided in New York from 1871 till his death Nov. 17, 1885. See his autobiography, *Literary Life* (New York, 1886).

Revised by S. M. JACKSON.

**Seymour**, see'mör: town; New Haven co., Conn.; near the junction of the Naugatuck, Bladen, and Little rivers, and on the N. Y., N. H. and Hart. Railroad; 10 miles N. W. of New Haven (for location, see map of Connecticut, ref. 11-F). It contains 5 churches, new high-school (building cost \$40,000), several other schools, public library, a weekly newspaper, and manufactories of paper, rubber, woolen goods, pins, nails, and mechanics' tools. The manufacture of woolen cloth was begun here over a century ago. In 1803 Gen. David Humphreys, who imported the first merino sheep into the U. S., bought the clothing-works here and built a large mill. The place was incorporated as the borough of Humphreysville in 1836, and as a town under its present name in 1850. Pop. (1880) 2,318; (1890) 3,318.

W. C. SHARPE, EDITOR OF "RECORD."

**Seymour**: city (laid out in 1852); Jackson co., Ind.; on the Balt. and Ohio S. W., the Evansv. and Terre H., and the Pitts., Cin., Chi. and St. L. railways; 18 miles S. of Columbus, 51 miles N. of Louisville, Ky. (for location, see map of Indiana, ref. 9-E). It is noted for its manufactories, which include rolling and planing mills, foundry, woolen-mill, and spoke, carriage, furniture, harness, and cradle factories. It contains the machine-shops of the Ohio and Mississippi Division of the Balt. and Ohio S. W. Railway, 10 churches, 5 public-school buildings, including the Shields high school, 2 national banks with combined capital of \$200,000, and 2 daily and 3 weekly papers. Pop. (1880) 4,250; (1890) 5,337; (1895) estimated, 6,500. EDITOR OF "DEMOCRAT."

**Seymour**, EDWARD, Duke of Somerset: See SOMERSET, DUKE OF.

**Seymour**, FREDERICK BEAUCHAMP PAGET, first Baron Alcester: naval officer; b. in London, Apr. 12, 1821; entered the navy in 1834, and passing through the different grades became admiral in 1882. In 1880 he was appointed commander-in-chief in the Mediterranean, and assumed supreme control of the allied fleet on the coast of Albania. In the military operations in Egypt in 1882 he bombarded the forts of Alexandria July 11-13, for which service he received the thanks of Parliament and was raised to the peerage. D. in London, Mar. 30, 1895.

**Seymour**, GEORGE FRANKLIN, D. D., LL. D.: bishop; b. in New York, Jan. 5, 1829; graduated at Columbia College in 1850 and at the General Theological Seminary in 1854; had charge of a mission station at Dobbs Ferry for six years; became first head of St. Stephen's College, Annandale, 1860, and in 1861 rector of St. Mary's church, Manhattanville, N. Y.; in 1863 went to St. John's church, Brooklyn, N. Y., and was in 1865 elected Professor of Ecclesiastical History in the General Theological Seminary; in 1874 was chosen bishop of the diocese of Illinois, but the General Convention refused to confirm him; in 1875 was elected Dean of the General Theological Seminary. In 1877 he was chosen Bishop of Springfield, Ill., and was consecrated June 11, 1878. Bishop Seymour has published numerous pamphlets and works, all of a theological nature, and chiefly written in defense of church doctrine. Revised by W. S. PERRY.

**Seymour**, HORATIO, LL. D.: Governor of New York; nephew of Senator Horatio Seymour; b. at Pompey, Onondaga co., N. Y., May 31, 1810; removed in childhood to Utica; studied at Oxford and Geneva Academies, N. Y., and at Partridge's Military Institute, Middletown, Conn.; was admitted to the bar at Utica 1832, but soon withdrew from practice to devote himself to the management of the large estate he inherited by the death of his father; was a member of the staff of Gov. Marcy 1833-39; was elected to the State Assembly as a Democrat 1841, and three times re-elected, serving as Speaker in 1845; was chosen mayor of

Utica 1842; was an unsuccessful candidate for Governor 1850; was Governor 1853-55; vetoed a prohibitory liquor law Mar., 1854; was defeated in the election of that year by the Prohibitionist candidate, Myron H. Clark; was again elected Governor as a War Democrat 1862; aided in suppressing the riots in New York, and rendered efficient cooperation to the national Government in the war for the Union; was defeated for re-election in 1864, in which year he presided over the national Democratic convention at Chicago, as he did again at New York 1868, when he was nominated for the presidency much against his will, and received 80 electoral votes. D. at Utica, Feb. 12, 1886.

**Seymour**, Lady JANE: third queen of Henry VIII., sister of Protector Somerset, and daughter of Sir John Seymour, b. in England about 1510; became maid of honor to Queen Anne Boleyn; married Henry May 20, 1536, the day after the execution of Anne, and died shortly after giving birth to a son (Edward VI.) Oct. 24, 1537. She was chiefly notable for her sympathy with the Protestant Reformation.

**Seymour**, THOMAS DAY: scholar; b. at Hudson, O., Apr. 1, 1848; graduated at Western Reserve College 1871; studied in Berlin and Leipzig 1870-72; Professor of Greek in Western Reserve College 1872-80; appointed Professor of Greek in Yale College 1880; chairman of the managing committee of the American School of Classical Studies at Athens since 1887. He has published as author and editor *Selected Odes of Pindar* (1882); *Homeric Language and Verse* (1885); *Homer's Iliad* (i-iii, 1887, iv-vi, 1891, *School Iliad* (1889). C. H. THURBER.

**Seymour**, THOMAS HART: Governor of Connecticut; b. at Hartford, Conn., in 1808; educated at Partridge's Military Academy at Middletown; became a lawyer at Hartford, and editor of *The Jeffersonian* (1837), a Democratic newspaper; was some time judge of probate; sat in Congress 1843-45; entered the Mexican war as major of the 1st Regiment; became lieutenant-colonel Aug. 12, 1847; commanded the regiment after the death of Col. Ransom at Molino del Rey; was breveted colonel for services at Chapultepec Sept. 13, 1847; was Governor of Connecticut 1850-55, and minister to Russia 1853-57. D. at Hartford, Sept. 1, 1868.

**Seymour**, TRUMAN: soldier; b. at Burlington, Vt., Sept. 25, 1824; graduated at West Point 1846; entered the First Artillery; was breveted lieutenant and captain for gallantry in the Mexican war; was assistant professor at West Point 1850-53; served under Maj. Anderson at Fort Sumter Apr., 1861; became chief of artillery of McCall's division of the Army of the Potomac Mar., 1862; was commissioned brigadier-general of volunteers Apr. 28, 1862; was distinguished in the Virginia and Maryland campaigns, commanding a brigade at Mechanicsville, Gaines's Mill and Glendale, and a division at Malvern Hill, Manassas, South Mountain, and Antietam; was severely wounded at Fort Wagner July 18, 1863; commanded an expedition to Florida Feb. 1864; was taken prisoner at the Wilderness; commanded a division in the Shenandoah valley Oct., 1864, and in the operations around Petersburg up to the close of the war. Brevetted from major to major-general in both the volunteer and regular army. Mustered out of volunteer service Aug. 1865, he returned to his regiment; received the degree of A. M. from Williams College; major Fifth Artillery 1866; retired 1876. D. at Florence, Italy, Oct. 30, 1891.

Revised by JAMES MERCE.

**Sfax** (probably the *Taphoura* of Ptolemy): fortified on the Gulf of Gabes, or Lesser Syrtis, Tunis; lat. 34° 44' N. lon. 10° 45' E.; is divided into two cities, the upper and lower, the latter also called Rabat. The harbor is safe, shallow, and large ships must anchor 2 miles out. The commerce is very large, and is chiefly with France, Italy, Great Britain, and Greece. Sfax is celebrated for its cambric sponges, and gardens. It is intensely Mohammedan, and is much admired in Arabic literature. Pop. 30,000, of which about 5,000 are Europeans. M. W. H.

**Sforza**, sfor'sä: the name of an Italian family who ruled Milan as a dukedom in the fifteenth and sixteenth centuries and exercised considerable influence on the politics of Italy by their ambition, which was generally accompanied with violence and faithlessness, and by their tactics, which was not always accompanied with education, though several members showed interest for and gave much protection to science, poetry, and art. The founder of the family was (1) GIACOMUZZO ATTENOLIO, a peasant-boy from

Revised by F. M. Colson.

**Shabbatai Tzevi**, born toward the close of the most troubled of the Jewish persecutions and a disappointed aspirant to the Messianic throne, b. to Sarnana, 1626, of Spanish descent; educated in the Talmud, Arabic, and becoming a mystic. Though was not a Moslem, he seems therefore 1666 being looked for and a Moslem was substituted for him. Having deceived his intentions, he was banished, went to Salomon, Mecca, Athens, and to Jerusalem, and achieved success, which was largely due to the numerous rabbis in which his brother Isaac and his sister, a daughter, of her second wife Sarah, of Raphael, was a rich Jew of Cairo, and of Nathan of Gaza, who returned to the Shabbatai's Elijah. In 1666 the company of his second wife to Aleppo and Sivevan, in Damascus, was publicly proclaimed Messiah. Most of the Jews had to convert to Christianity, but his fame spread and some of the European countries in him, even defied him. He died in a speedy conversion to Palestine, and in 1676 Shabbatai went to Constantinople, where he was imprisoned. Sept. 14 he saved his life by changing a Mohammedan under the name of Mehdud. He passed the terrible pain of being a Mohammedan, and a Jew to his followers. The Turks executed him. He was banished to Bulgaria in Albania, where he died in 1676. From after his death, the movement of the Moslems and all sorts of believers in his Messiahship, especially in Mecca to the Mohammedan world, 1688-10, 11, and some converts, occurred with his found in Orissa, *Chasch*, and in other parts. For the earlier literature, see *Orissa*.

Shad 191. Long slender form, the activity of, World-wide. It has long, slender, bony, [very] [an] [oblong] [and] [spoon] of the family *Clupeidae*, [growing] [in] the [form] [and] [of] a rather [high] and [compressed] body, with [tremendous] and [erect] body, the [proportions] and [colored] [high] than [long] [a] [comp] [suffering] [much] in the [upper] [part] and [the] [end] of the [mouth] and [remains] at [least] [in] [length]; there are [two] [anterior] [and] [posterior] [in] a [series] [of] [faint] [lines], [the] [first] [of] [which] they are [regarded] as [constituting] of the [individual] [parts] [of] [the] [body], [including] the [salt] [water] [is] [strong], etc. The [species] are all [characterized] of [tremendous] [importance], and [characteristic], like the [common], living [the] [greater] [portion] of the [food] [in] the [sea], but in the [spring] [of] [winter] the [fish] [in] [large] [schools] for the [purpose] of [spawning]. The [time] of [season] is [determined] by the [temperature], and the [point] is [only] [limited] by [unaccountable] [changes] in the [form] of [days] or [fairs] which [can] not be [explained] although the [larger] [portion] [of] [the] [winter] [is] [before] this [last] [point]. The [eggs] are [moderate] in [size], the [number] of a [single] [female] [having] [generally], it is [said], about 20,000 eggs, although sometimes as [many] as 100,000 to 150,000. They are [discharged] [near] the [surface], and [slowly] [go] [to] the [bottom]. The [time] between [impregnation] and [hatching] [depends] on the [temperature], and [varies] from [about] three to [six] days; thus when the [temperature] is [about] 55° to 70° F. they [hatch], in about [seventy] [hours] or [little] [more], while at a [temperature] of 62° to 67° they are [delayed] [to] about [six] days. The [American] species [are] [found]—viz., *Alosa sapidissima* and *Alosa punctata* of Western Europe, *Alosa sapidissima*, ranging from the [Mediterranean] to the [Atlantic] and the *Alosa punctata* [is] [found] [when] especially [abundant] the Yang-tze-Kiang. The [European] species [are] [found] in [much] [less] [extent] than the *American* and *Asian*. The [net] are [employed] among the [best] of [fishes] in their [respective] [countries], and their [eggs] are [also] [employed] as [special] [objects] of [luxury]. The [capture] of these [fishes] gives [rise] to a [large] [industry], and in the [early] [spring] months the [fishermen] are to a [large] [extent] engaged in their [capture] by means of [fixed] [nets] as well as [ seines] and to a [small] [extent] of [trawls]. Shad eat little or nothing when in fresh water, but sometimes rise to the fly, although not enough to constitute them generally recognized game-fishes. In the salt water and estuaries they feed chiefly on small crustaceans, such as species of *Myxia*, etc. See *FRONTINUS*, *FISH CULTURE* and *PRODUCTION*.

Report by E. A. Leach

blind-bush or blind-tree: See *LOVE-APPLE*.

**Shaddock** called **Pomelo** in the East Indies, the large fruit of the *Citrus pomelo*, a small tree of the orange family (*Rutaceae*). It has a watery pulp, cooling and aromatic, and somewhat bitter. It is used for preserves. It was named from one Shaddock, who is said to have carried it from India to Jamaica. Many descriptive varieties. The fruit sometimes weighs 15 lb. It is also called pomelo and grape-fruit. Its botanical characters it differs from the orange in having a persistent young growth, the leaves very large and often serrated, and pubescent beneath, petioles much winged. It is a native of Malacca, but is now spread in the tropics.

145 Lomb St. Bklyn. N.Y.

**Shadow-bird:** a wading bird (*Scopus umbretta*) confined to the swamps and bays, found throughout the greater part of Madagascar and Africa. It is named from its color, a deep brown with bronze reflections. The tail is barred with black, the bill is sharp and compressed and hooked at the tip, and the head bears a long crest. The bird is rather sluggish. Although only 20 inches in length, it builds a fabulous nest of twigs about 4 feet in diameter, which is placed on a tree or ledge of rocks. E. A. L.

10. A. 1.

**Shadwell, Thomas;** dramatist. b. at Standon Hall, Norfolk, England, about 1690; educated at Cambridge; studied law at the Temple, London; traveled in the Continent; acquired considerable reputation by his comedy, *The Squire's Legacy*, produced in 1756; devoted himself thenceforth to literature; his dramatic work, was, author, among many other plays, of *The Vicarage* (1756), *Lovers*

*shire Witches* (1682), *The Squire of Alsatia* (1688), and *Volunteers, or The Stock-jobbers* (1693); became poet-laureate and royal historiographer 1688, succeeding Dryden in both posts, and thereby incurring a resentment which led to his unjust impalement by that poet as the hero of *Mac Flecknoe* in the character of "monarch of dullness." D. Dec. 6, 1692. His collected *Works* appeared in 4 vols., 1720.

Revised by H. A. BEERS.

**Shaftesbury**, ANTHONY ASHLEY COOPER, First Earl of: party leader; b. at Wimborne St. Giles, Dorsetshire, England, July 22, 1621; entered Exeter College, Oxford, 1637; was elected for Tewkesbury to the Short Parliament in 1640; at first supported the king, but after ten months' service in the royalist army went over to the popular party in 1644, and took an active part in the war. He was a member of the "Barebones" Parliament in 1653, and of Cromwell's council of state in the same year, but later separated from the cause of the Protector and co-operated in the restoration of Charles II. As a reward for his services he was made a privy counselor in 1660 and Chancellor of the Exchequer in 1661, having previously been raised to the peerage with the title of Baron Ashley. He was one of the grantees of the province of Carolina 1663 and 1665; secured the services of John Locke as private secretary 1666, and prepared with Locke the famous aristocratic constitution for the government of the Carolinas. A member of the "Cabal" 1670, he allowed himself to be deceived as to the true nature of the disgraceful Treaty of Dover. In 1672 he was made Earl of Shaftesbury and Lord Chancellor, but in 1673 went over to the opposition and lost his office. Protesting against the prorogation of the Parliament, he was imprisoned in the Tower 1677-78, but on his release continued as the bitter foe of the court party, and, professing to believe the perjured testimony of Titus Oates, took the lead in the persecutions of the Catholics. He procured the passage of the Habeas Corpus Act 1679; presented the Duke of York before the court of king's bench as a "Popish recusant" in 1680; brought armed followers to the Oxford Parliament in 1681; was thrown into prison by order of the council on a charge of high treason July 2, but released Dec. 1, 1681, the grand jury having refused to find a true bill; went to Amsterdam Nov., 1682, and died there Jan. 22, 1683. He was the Achitophel of Dryden's satire, is brilliantly sketched by Macaulay in his *History*, and gave name to Ashley and Cooper rivers in South Carolina. See his *Life*, by W. D. Christie (1871); also Fox-Bourne's *Memoir of John Locke* (1876); and a biography by H. D. Traill in the English Worthies Series (1886).

Revised by F. M. COLBY.

**Shaftesbury**, ANTHONY ASHLEY COOPER, Third Earl of: grandson of the first earl; b. in London, Feb. 26, 1671; was educated under the supervision of Locke; entered Parliament 1693; resided in Holland 1698-99; succeeded to the peerage 1699; supported the administration of William III., and retired from public life on the king's death; was noted as a philanthropist and stigmatized as a free-thinker; published a *Letter on Enthusiasm* (1708) in defense of the rights of the "French Prophets," *The Moralists*, a *Philosophical Rhapsody* (1709), *Sensus Communis* (1710), *A Soliloquy, or Advice to an Author* (1710); spent much of his time on the Continent, and was preparing a work upon the arts of design when he died at Naples, Feb. 15, 1713. His principal work, *Characteristics of Men, Matters, Opinions, and Times*, was posthumously published (3 vols., 1713-23; often reprinted), and enjoyed great popularity. See Fowler, *Shaftesbury and Hutcheson* (London, 1882).

**Shaftesbury**, ANTHONY ASHLEY COOPER, Seventh Earl of: b. in London, Apr. 28, 1801; took a first class in classics at Oxford, 1822; was made D. C. L. 1841; entered Parliament 1826, representing the borough of Woodstock from 1826 to 1830, Dorchester 1830 and 1831, the county of Dorset, in which the estates of the family are situated, from 1833 to 1846, and the city of Bath from 1847 to 1851; supported the administrations of Liverpool and Canning; was made a commissioner of the India board of control by the Duke of Wellington 1828; was a lord of the admiralty under Sir Robert Peel 1834-35; succeeded his father in the peerage 1851. He was chairman of the Lunacy Commission from 1828 till his death, and did much to secure the passage of bills which have been called the Magna Charta of the liberties of the insane. He labored zealously to improve the condition of the working classes; carried through the Ten Hours' Bill, and followed it up by obtaining the assent of Parliament

to other measures regulating defective workshops and factories, night work, and the treatment of children by their employers in trades and manufactures, etc. His course in public life was always very independent. He was the leading philanthropist in English-speaking lands, and stood in public estimation as the embodiment of every virtue. His endorsement of any scheme was sufficient to give it success. He was therefore continually called upon to preside at meetings of all sorts. He was president of the British and Foreign Bible Society, the Pastoral Aid Society, the Evangelical Alliance, and other organizations for the propagation of evangelical doctrines, and was long regarded as the head of the so-called Exeter Hall school of Low Churchmen. He was an active promoter of the abolition of slavery throughout the world. D. at Folkestone, Oct. 1, 1885. See his *Life*, by Edwin Hodder (3 vols., London, 1886; n. e., 1 vol., 1887).

**Shagreen'** [from Fr. *chagrin*, from Turk. *sāghri*, back of a horse (from the skin of which shagreen was first made, shagreen): a variety of tawed leather made in Persia and other parts of the East, and long celebrated for its hardness and strength. The name shagreen is also given fish-skins, principally those of sharks and rays, covered with calcified papillæ. Shagreen prepared from the tuberculous skin of the ray (*Trygon sephen*) is called *galuchal* by the French. Shagreen is dyed in various colors, and is used as a covering for small articles, as boxes and handles of swords.

**Shah** [from Pers. *shāh*, king; cf. *chess*, *pasha*, and *sahat*; Pers. *kshātra*, province; Sanskr. *kshātra*-, rule, power]: the title of the ruler of Persia and of certain other Asiatic princes. The sons and other male relatives of the Persian shah also assume this title, the full title of the monarch being *shah-in-shah*, king of kings.

**Shāh Abbās**: See ABBĀS I.

**Shahap'tian Indians**: a family of North American Indians, comprising the following named tribes: Chopunnish, Sahaptin, Nez Percé or Nimapu (the last being their own name), Klikatat, Palooos, Tenaino, Tushepaw, Tyigh, Umatilla, Walla Walla, Yakima.

**Habitat**.—The tribes occupied a large section of country along the Columbia river and its tributaries, their western boundary being the Cascade Mountains. The Chopunnish were found in 1804 occupying a large area in Western Idaho, Northeastern Oregon, and Southeastern Washington, on the lower Snake river and its tributaries. The Klikatat occupied the head waters of Cowlitz, White Salmon, and Klikatat rivers, Washington. The Palooos in 1805 were on Clearwater river, Idaho, above the Forks, and on the small streams tributary to it, W. of the Rocky Mountains. The Tushepaw appear to have been an eastern branch of the Nez Percé. According to Lewis and Clark's report the Walla Walla lived on both sides of Columbia river, from the mouth of Lewis (or Snake) river to the Musselshell Rapid, wintering on Tapteel (or Yakima) river. It is probable that under the general name Lewis and Clark included one or more other divisions, the Umatilla, for instance, who originally lived on Umatilla river, Oregon. The Tenaino, who are nearly related to the Warm Spring Indians, formerly lived at Clifton, Oregon, on Columbia river. The Tyigh originally occupied Tyigh creek and valley, the former being a tributary of the Des Chutes river, Oregon, about 30 miles S. of the Dalles. The Yakima (called Shanwappam by Lewis and Clark) were found in 1805 on the head waters of Cataract (or Klikatat) and Tapteel (or Yakima) rivers, Washington.

**General Characteristics**.—Comparatively little is known of the mutual relations of the several members of this family. The linguistic family as a whole is a rather well-defined one, though in some of its sounds and in its harsh character the language considerably resembles the Chinook and Salishan. In habits of life the Shahaptian tribes differed considerably from the Chinook of the Columbia, to whom they were much superior, and more nearly resembled the inland Salishan tribes. Living as they did on the large water-courses, salmon constituted their most important food, but the possession of horses (for all the tribes were "horse Indians") undoubtedly wrought considerable change in their habits, and caused them to become, to some extent, hunters. At the time of Lewis and Clark's visit (1804-05) none of these tribes had any idea of agriculture, and some of the bands met by the explorers on Snake river periodically suffered from hunger. The Chopunnish were then living, like the Chinook, in communal houses, and the same custom probably prevailed also in the other divisions of the family.

Shoshone. When Lewis and Clark passed down the Columbia in 1805-6, only two Shoshone tribes, the Lemhi and the Falls, were the first Shoshone tribes to meet, one tribe at the Falls, the two tribes being in friendly contact. They met then at war, and there is evidence to show that during the next few years the Shoshone tribes continued upon the Shoshone territory and were removed from the Lemhi and Falls, probably the same removals upon the Lemhi. The Klamath, who, during the 1840's, had crossed the Cascade Mountains into Klamath river, Washington, crossed the Cascade Mountains and went 1850 and crossed the Willamette valley, going back only as far as the Umpqua valley, Oregon, and apparently they were compelled to give up their country. The 1840's they were found in the coastal and prairie belt between Vancouver and the Falls, at the base of the Coast Range. In 1840 the Puget Sound S. of Tacoma. The 1840's crossed the Puget Sound, from then to British Columbia, at the mouth of Puget Sound. The Shoshone Indians are now located on various reservations in Idaho, Washington, and Oregon.

[illegible]

*Amphibatrachus*? large city of Rohilkhand, Northwest Provinces, British India, lat. 27° 02' N., lon. 79° 28' E., is situated on a tributary of the Ganges (see map of N. India, p. 14). The city was founded in 1547 during the reign of Akbar, Emperor, whose name it bears, and contains a large mosque and the ruins of a fort. It has some small trade in cereals and sugar. Pop. (1901) 78,000. It is the chief place of a district of the same name. Area, 100 sq. miles. Pop. 300,000. Simhapatnagar is the name of an ancient town in Northern India.

26th June, members of the Society of Friends. Jane Wootton, who claimed to have been a friend of the late Lord and Countessess, the personal nursing of Christ in the famous woman, passed on to her followers Ann Lee, daughter of a Quaker settler, who was born in Manchester, Jan. 29, 1736, married Amosm Stacey a Quaker, and united with the sect of Anabaptists and James Woodhouse, Detroit, 1759. She was elected to the Society of 1779, during the persecution and arose against the Shakers, and while a captive received a revelation from the Lord which showed her that the religious only could minister to the masses, as a proper relation with God, and amongst the acknowledged head of the sect.

On May 10, 1774, and others, on revelation, this interval for North America with such settlements, including one here and one afterward left here, and John Hancock, who had some property. Six landed in New York Aug. 6, settled in Waterbury, a town S. W. of Albany, 1776. On the 13th, 1776, "Good Day" (May 10, 1780) Pastor James Whitaker preached the first public testimony of Mother Anna's gospel to America. Between that time and his death at Waterbury, in Sept., 1784, it is thought that over 2,000 people received his testimony. James Whitaker succeeded his brother of the people left his death at 45 years, Conn. July 1787.

After him Eliza Joseph Mowbray, for the people, and assisted by able helpers, established commercial societies, and regulations in all their families, guiding them till her death at New Lebanon, July, 1828. He had four sons, two of whom, and was son of a Baptist elder of the same name, was Aaron C. Burdick, born, in 1780. He is called the Father of a Church.

Archbishop Lucy Wright, who was Father Joseph's chief helper on the sisters side, guided the people twenty years, till her death, at the age of eighty-one in Worcester, Feb., 1891. She was born in Pittsfield, Mass. During her ministry, five societies were established in this and Kentucky, and ballows increased to number thirteen. Florence Bishop, Rufus Bishop, Ruth Landon, and Cecelia Clark were the leading ministers from 1824 to 1852. From 1850 to 1890 three new societies were established, and the population of the westernmost southern town meeting was about 5,000 souls.

In 1867 remarkable spiritual manifestations began at Watertown, and in less than a year spread through all the families. First the youthful and untutored boys taken away in visions and trances, described scenes and dwellers in the spirit spheres, being, as they believed, desired to deliver messages, both verbally and in writing, from Mother Ann and her disciples whom in the body, and their successors, from Jesus, from apostles, patriarchs, and prophets, and other exalted witnesses, to the effect that they had come to help the leaders to purge out doctrine, and to restore church rates and discipline to the residents of their homelands.

They brought a flood of light and of spiritual gifts localizing and inscribing to a carnal nature, to the vanity of youth, and pride staining to all flesh, but edifying and strengthening to the little child in Christ. They said it was to prepare us for the gospel to go forth to preaching. At the end of fifteen years one spoke in the name of Mother Ann, that evil was thence lay on board and put down that it had no power to rise in the church, which from stood on pure grounds than ever it had before. Mother Ann's special manifestation lasted, it is claimed, about those years. But there were many subsequent spiritual manifestations, and many were converted to them. Growth of spirits from Hades were taught the gospel of the judgment, and the absolute necessity of confessing and forsaking their sins to find acceptance with God.

Shakers believe that Christ has made his long and arduously awaited second appearing in Ann Lee and her followers; that God is one in essence, but dual in his composition and perfect manifestation; the redeemed and perfected man and woman; that they are in the work of the harvest, the resurrection, the judgment day, aiding the world to themselves by adherence to the everlasting gospel, and entering in the dawn of the millennium age. They own no material husbandry, nor private personal property, nor have material relations; they hold their possessions as a united and concentrated interest, each tending for the good of the whole in observing one another, in helping perfecting one another as brothers and sisters in a family. The government is wholly parental. The leading authority is vested in four persons, two of each sex called ministers. "The head of a family is an eldership, consisting when complete of four

two of each sex. Elders are assisted by deacons, two of each sex when the order is full, or more if necessary, who manage temporal affairs. The total number of Shakers in the U. S. is about 1,000, forming 15 societies or settlements, of which 2 are in the State of New York, 3 in Massachusetts, 1 in Connecticut, 2 in New Hampshire, 2 in Maine, 3 in Ohio, and 2 in Kentucky. New Lebanon, in Columbia co., and Watervliet, in Albany co., N. Y., are the most important.

The Shakers publish a monthly, called *The Manifesto*, at East Canterbury, N. H. It was started in 1871. See also *The Concise History of Shakers* (East Canterbury, 1894); *Pearly Gate* (Chicago, 1894); and *The Millennial Church* (Albany, N. Y., 1848). ALONZO G. HOLLISTER, Elder.

**Shakespeare, WILLIAM**: dramatic poet; b. at Stratford-on-Avon, Warwickshire, England, in Apr., 1564—on the 23d of that month, O. S. (N. S., May 8), it is supposed. His father, John Shakespeare, was of the yeoman class; his mother, Mary Arden, was of a family of the minor gentry. John Shakespeare seems to have been a man of character and ability. He became a landholder, and rose rapidly through all the grades of office in Stratford until he became chief alderman and *ex-officio* justice of the peace. Misfortune, however, befell him, and he was reduced to comparative poverty, and was even subject to arrest for debt. Of Shakespeare's boyhood nothing is known; but he was doubtless educated at the grammar school in Stratford, where he got the "small Latin and less Greek" with which Ben Jonson credits him. Passages in his works showing more than ordinary familiarity with law-terms have been regarded as indicating that he was for a time in an attorney's office. This is more probable than the tradition that he was apprenticed to a butcher. The first fact that is really known about him, after his baptism, is that in his eighteenth year he had become entangled with a woman of twenty-five, Anne Hathaway, the daughter of Richard Hathaway, who lived at Shottery, near Stratford. He married this woman by special license, dated Nov. 28, 1582, and their first child, Susanna, was baptized May 26, 1583. Twin children, a boy and girl, named Hamnet and Judith, were baptized Feb. 2, 1585. Shakespeare soon (perhaps in 1585) left Stratford to seek his fortune in London. Tradition says that he had killed some of the deer of Sir Thomas Lucy, of Charlecote, near Stratford, and that the knight's vindictiveness was one of the causes of his leaving his native village. The story, not improbable in itself, finds a certain confirmation in the fact that Sir Thomas is apparently caricatured as Justice Shallow in *The Merry Wives of Windsor*.

Absolutely nothing is known of Shakespeare's first years in London. Tradition says that he began by holding horses at the door of the theater. It is certain that he soon got some humble position inside the theater (another tradition says as a mere "prompter's attendant"), and after a time became an actor, though he seems never to have risen higher than a position of what is known as "general utility." He was one of the original performers in Ben Jonson's *Every Man in his Humour*; he appeared in the same author's *Sejanus*; and there is a tradition that he played the Ghost in *Hamlet*, and that his brother Edward saw him play the part of an old man, which was probably that of Adam in *As You Like It*. A few years later he began his career as a dramatist by rewriting old plays in conjunction with others, his seniors in years and as playwrights. It was the custom of the various companies of players to have several playwrights in their pay, who, working together, produced new plays and patched up old ones. Marlowe, Greene, and Peele were perhaps among Shakespeare's collaborators. His superiority to all his contemporaries soon asserted itself, and he began to write alone or with little assistance. His first wholly original play was probably *Love's Labour's Lost*; for in *Titus Andronicus*, a revolting tragedy characteristic of a kind of drama then in vogue, there are but slight traces even of his prentice hand. He probably also in his earliest dramatic days had some small share in the revision of Part I. of *Henry VI.*, which was almost certainly an old play by another author or authors.

Shakespeare's success provoked the jealousy and excited the enmity of at least one of those whom he eclipsed—Robert Greene, a gifted but dissolute man, who died in wretchedness, and who, in a pamphlet written during his last illness, sneered at Shakespeare as "an upstart crow, beautified with our feathers; . . . and that being an absolute *Johannes factotum*, is in his own conceit the only Shake-scene in a country." "Beautified with our feathers" may mean

that he got credit by acting what others wrote; but some take it to be a charge of plagiarism in the revision of plays written by others. A few months later, Henry Chettle, who was one of the knot of writers to which both Greene and Shakespeare belonged, came to the defense of the latter in a pamphlet in which he says that Shakespeare's demeanor was "no less civil than he was excellent in the quality he professes"; adding that "divers of worship [people of rank and reputation] have reported his uprightness of dealing, which argues his honesty, and his facetious [felicitous] grace in writing which approves his art." Among the friends that Shakespeare won was the Earl of Southampton, a nobleman of taste and culture, who took great interest in literature and the drama. To him the poet dedicated his first published poem, *Venus and Adonis*, which was his first purely literary effort: he calls it "the first heir of his invention." There is a tradition that Southampton gave Shakespeare £1,000, quite equal to £8,000 at present. This may be an exaggeration, though such munificence was not unknown in those days among English noblemen. When Shakespeare published *Lucrece*, his second poem, he dedicated it also to Southampton, saying, "The love I dedicate to your lordship is without end. . . . What I have is yours; what I have to do is yours; being in part all I have devoted yours." This is apparently the acknowledgment of a great service, and it was possibly through the nobleman's generosity that the poet-dramatist became a very considerable sharer in the Blackfriars theater, at which the company with which he was connected was in the habit of performing. Having attained this advantageous position, Shakespeare soon reached the utmost height of success, as to both reputation and profit, possible to one of his profession. The notion long prevalent that he was neglected during his life, and that his plays rose in popularity only a long time after his death, is entirely unfounded. Contemporary evidence shows that he was the most admired of all the dramatists of his day, and that was the productions of the best of his contemporaries—Ben Jonson included—failed to pay the expenses of their representation, his plays filled the house to overflowing. He entered upon a career of dramatic production which is without a parallel in the history of literature, and which soon placed him in independent circumstances. He had money to spend and money to lend; and he used it to place his father in comfort and to acquire landed property and other wealth in his native town. The Herald's College made his father a gentleman by coat-armour, and this may have been done at the instance of the successful playwright, who thereby became a "gentleman" by descent both on his father's and his mother's side. He invested a part of his money in the title of Stratford, and he bought New Place, the best house in the town, and gradually added other lands to the estate. To this house he retired on his withdrawal from the theater about 1611, and there he died Apr. 23, 1616, and was buried on the 25th in the Stratford church. His daughter Judith was married to Thomas Quiney, a vintner, about two months before her father's death. Her sister Susanna became the wife of Dr. John Hall, a Stratford physician, in 1607.

Of Shakespeare's life in London very little is known, almost nothing except the successive production of his plays. Fuller says that he and Ben Jonson used to have many "wit-combats," in which he compares Jonson to a heavy Spanish galleon and Shakespeare to a light English man-of-war. Jonson was his junior, but was one of those who knew him intimately; and jealous, hot-tempered Ben loved him well and honored his memory after his death. He supports Fuller's comparison by saying, with a classical allusion, that Shakespeare was distinguished by great copiousness and facility of thought and language—so great as to be almost oppressive to his hearers. There was a sort of club of which Raleigh, Jonson, Beaumont, Selden, and Donne were members, and which met at the Mermaid Tavern; and the wit-combats probably took place at these meetings. Tradition says that Jonson owed to Shakespeare's influence the performance of his first comedy, *Every Man in his Humour*, which had been offered and rejected. This story agrees with Shakespeare's reported kindness of nature, and with the gruff and cynical scholar-dramatist's love for him.

Shakespeare's *Sonnets*, 154 in number, were published in 1609, and were dedicated to a "Mr. W. H." as their "only begetter," but by the publisher, not by the poet, who seems to have had no agency in the publication of any of his works except *Venus and Adonis* and *Lucrece*. If, as the great majority of editors, critics, and commentators believe (among them Wordsworth, Coleridge, Sir Henry Taylor, Swinburne,

in some verses almost as hard and expressionless as the engraving itself, assures us was a good likeness, has a general conformity in the features and the form of the head to the bust. The latter was originally colored after life, and had hazel eyes and auburn hair and beard. These traits were afterward obliterated by a coat of white paint. The bust and the engraved portrait in the folio are the only portraits of Shakespeare which are of undoubted authenticity; but one known as the Chandos portrait has tradition of very respectable antiquity in its favor. There is a very slight and vague tradition that Shakespeare "died a papist," but this is very improbable. His works favor no religious form, sect, or dogma. There was also a tradition in Stratford fifty years after his death that he, Drayton, and Ben Jonson had "a merie meeting, and it seems drank too hard, for Shakespeare died of a feavour there contracted." This tradition has probably as little foundation as the other.

Although Shakespeare was acknowledged as the greatest dramatist of his time, his reputation rather diminished than increased during the century after his death. He had no followers or imitators; he established no school. Dramatic taste and dramatic writing steadily declined after the Elizabethan age (about 1575 to 1625), and by the beginning of the eighteenth century Shakespeare was lightly thought of by the literary critics, and much neglected by the actors. There had been among the reading public, however, a steady although not a large demand for his plays. The folio of 1623 was succeeded by another folio in 1632, and a third edition was called for and published in 1664. In the last *Pericles* and six spurious plays which had been published in quarto in Shakespeare's lifetime, with his full name or his initials upon the title-page, were included. A fourth edition, also in folio, appeared in 1685. Upon these four folios, and upon the existing old quarto edition of twenty of the plays, the readers of Shakespeare depended until Rowe's edition appeared in 1709 (see bibliography below). From the time of the appearance of this edition the fame of Shakespeare steadily grew until about the beginning of the nineteenth century he was acknowledged to be the first of poets and of dramatists, the most creative mind, the greatest master of imagination and of language, that the world has known. The number of Shakespeare's commentators has much exceeded that of his editors. His text was left in such a condition by the printers of the old quartos and folios that, although it may be read even in those impressions with pleasure and with a full comprehension of its general meaning, there is to its perfection need of more critical labor than is required by most old manuscripts; and of such there is none to consult, for of Shakespeare's writing not a line has come down to us—not even a word, except his own signature. It is safe to say that more critical ability and learning has been displayed upon this subject than upon any other in the whole range of literature, the poems of Homer perhaps excepted. The works written upon Shakespeare form a library in themselves, and a complete bibliography (unfortunately there is none such in existence) would fill a good-sized volume.

Shakespeare, like so many other men of great eminence, left little trace of his personality behind him. His only son, Hamnet, died at the age of twelve years. His two married daughters left children, but the family, even on the female side, became extinct in the third generation. New Place, his residence upon his retirement from the theater, after passing through several hands was in 1759 razed to the ground by its last owner, the Rev. Francis Gastrell, who was exasperated by a quarrel with the town authorities and by the persecution of prying visitors to the home of the great poet. John Shakespeare's house, which stands in Henley Street, and in which it is probable that William was born, was a comfortable dwelling for that age. After falling into decay, it was bought by an association and restored for preservation as a memorial of the poet. More recently, the grounds of New Place and the cottage at Shottery in which Ann Hathaway is supposed to have lived before her marriage have been bought for the same purpose.

RICHARD GRANT WHITE. Revised by W. J. ROLFE.

#### BIBLIOGRAPHY.

**Editions.**—Among complete editions (besides the early folios mentioned above) that are of any critical value, the following may be named: Nicholas Rowe's (6 vols., 1709); A. Pope's (6 vols., 1723-25); Louis Theobald's (7 vols., 1733; 2d ed. 1740); Sir Thomas Hanmer's (9 vols., 1744); Bishop Warburton's (8 vols., 1747); Edward Capell's (10 vols., 1760-68);

Dr. Samuel Johnson's (8 vols., 1765); Isaac Reed's (10 vols., 1785); Edmond Malone's (10 vols., 1790); George Steevens, with Boydell's illustrations (9 vols., 1802; in parts, 1791-1802); Reed's (first ed. with his name, 21 vols., 1803; 2d ed. 1813); Alexander Chalmers's (10 vols., 1805); the *Variorum* of 1807, edited by James Boswell from a corrected copy left by Malone (21 vols.); S. W. Singer's (10 vols., 1826); Charles Knight's Pictorial ed. (8 vols., 1838-43); J. P. Collier's (8 vols., 1842-44; 2d ed. 6 vols., 1858); G. C. Verplanck's (3 vols., 1844-47); H. N. Hudson's (11 vols., 1851-56); J. O. Halliwell's, afterward Halliwell-Phillipps's (16 vols. folio, 1853-65; only 150 copies printed); Singer's 2d ed. (10 vols., 1856); R. Grant White's (12 vols., 1857-66); Alexander Dyce's (6 vols., 1857-2d ed. 9 vols., 1864-67; 3d ed. 9 vols., 1875); Howard Staunton's (3 vols., 1858-60); the Cambridge ed., by W. G. Clark and W. Aldis Wright (9 vols., 1863-66; 2d ed., by W. A. Wright, 1891-93); Charles and Mary Cowden-Clarke's ed. (3 vols., 1863-66); W. J. Rolfe's (40 vols., 1870-83; Friendly ed. 20 vols., 1884); Horace Howard Furness's *New Variorum* (10 vols. issued, 1871-95); Clarke and Wright's (6 vols., ed. (the standard for line numbers, 1874); H. N. Hudson's Harvard ed. (20 vols., 1880-81); R. G. White's Riverside ed. (6 vols., 1883); the Henry Irving ed., by Sir Henry Irving and F. A. Marshall (8 vols., 1888-90); the Banksian ed., by Appleton Morgan (20 vols., including the twenty plays of which early quartos exist, 1888-92); the Temple ed., by Israel Gollancz (1894—not completed in May, 1895). The Leopold ed. (1 vol., 1877), with the German Delius's text, is valuable for the elaborate biographical and critical introduction by F. J. Furnivall.

Editions of single plays and series of plays (mostly for educational use) are too numerous to be catalogued here. The Clarendon Press and Rugby series, and Charles Worth's *Shakespeare's Historical Plays* (3 vols., 1843), are noteworthy among those which have some critical value.

The *Poems and Sonnets* are included in most of the recent standard editions. The first complete edition of both was issued in 1709 (an incomplete edition appeared in 1649). The *Sonnets* were first collected in 1609. The best modern edition is Edward Dowden's larger ed. (1881). Another important one is Thomas Tyler's (1890).

The first complete American edition of the works (with life, glossary, and notes by Dr. Johnson) was published in 8 vols. in 1795-96, at Philadelphia. The first Boston edition (including only the plays) was in 8 vols., 1802-04. Three editions of this appeared, each reset, stereotyping being then unknown. An edition in 17 vols. was published at Philadelphia in 1809, and one in 7 vols. (edited by O. W. B. Parbody, though his name does not appear in it) in Boston in 1836 (reprints of Reed's text had been issued in 1813 and 1814). An edition of the plays in 10 vols. (Reed's text) appeared in New York in 1821, and again in 1824. The first American edition of the *Spurious and Doubtful Plays* was published at New York in 1848.

**Life, Birthplace, etc.**—S. Neil, *Shakespeare, a Critical Biography* (1861); Halliwell-Phillipps, *Outlines of Life of Shakespeare* (7th ed. 1887); F. G. Fleay, *Life and Works of Shakespeare* (1886); D. W. Wilder, *Life of Shakespeare* (1893); T. S. Baynes, *Shakespeare Studies* (1894); C. M. Ingleby, *Shakespeare, the Man and the Book*, parts i. and ii. (1877-81); C. Knight, *Biography of Shakespeare* (in Pictorial ed., but also published separately); G. R. French, *Shakespeareana Genealogica* (1869; on the Shakespeare and Arden families, persons, and places in Warwickshire mentioned by Shakespeare, and characters in the historical plays); J. R. Wise, *Shakespeare, his Birthplace and its Neighborhood* (1861); Sidney Lee, *Stratford-on-Avon* (n.c. 1890); J. L. Williams, *Homes and Haunts of Shakespeare* (superbly illustrated, 1891-93); W. Winter's *Shakespeare's England* (illustrated ed. 1893); and *Old Shrines and Inns* (1894). J. Walter's *Shakespeare's True Life* (1890) is copiously illustrated, but not always trustworthy.

**Dictionaries and other Reference-books.**—A. Schmidt, *Shakespeare Lexicon* (2d ed. 1886); Dyce's *Glossary* (vol. ix. of ed. of Shakespeare published separately); R. Nares, *Glossary* (rev. ed. 1859); Charles and Mary Cowden-Clarke, *Shakespeare Key* (1879); J. Bartlett's *Concordance to Shakespeare* (1895; supersedes all earlier works of its class); Mrs. H. H. Furness, *Concordance to the Poems of Shakespeare* (1874; gives every instance of every word); E. Abbott's *Shakespearean Grammar* (1873); W. S. Walker's *Shakespeare's Versification* (1854) and *Critical Examination of Text of Shakespeare* (1860); A. J. Ellis's *Early English Pronunciation* (part iii. published separately); E.

Supreme Being is good, yet so great are the power and desire of the king of the lower world to injure man that the principal worship conducted by the Shamans is intended to placate him. Hence the declaration that Shamanism is devil-worship. See Tylor's *Primitive Culture* (2 vols., 1871).

**Sham'mai** (shortened from Heb. *Shemáya*): one of the leaders of the Sanhedrin during the reign of Herod. He is always mentioned together with Hillel, from whom he is said to have differed greatly by his harshness of manner and his rigorous interpretation of the Law. The followers of these two teachers, who still existed in Jerome's days, preserved the traditions of their masters, though the freer interpretations of the Bêth Hillel prevailed over the more rigorous of the Bêth Shammai. Shammai is supposed to be identical with the *Zadokas* (Josephus, *Ant.*, xiv., 9, 4) who alone dared to oppose Herod when he appeared before the Sanhedrin in 47 B. c., and who was spared by Herod on the taking of Jerusalem (*ib.*, xv., 1, 1).

RICHARD GOTTHEIL.

**Shamo, Desert of:** See Gobi.

**Shamo'kin:** borough: Northumberland co., Pa.; on the Lehigh Val., the North. Cent., and the Phila. and Reading railways; 17 miles W. of Ashland, and 19 miles S. E. of Sunbury, the county-seat (for location, see map of Pennsylvania, ref. 4-G). It is in the center of the anthracite coal region; contains several foundries, machine-shops, and other manufacturing, 15 churches, 45 public-school buildings (1890-91), public-school property valued at over \$140,000, water-supply from Shamokin creek, and electric lights; and has a national bank with capital of \$100,000, a State bank with capital of \$50,000, a building and loan association, 3 daily and 4 weekly newspapers, an assessed valuation (1893) of \$1,004,020, and a total debt (1894) of \$59,000. Pop. (1880) 8,184; (1890) 14,403.

**Shamrock** [from Ir. *seamrog*: Gael. *seamrag*, trefoil, white clover]: the national badge of Ireland, as the thistle is that of Scotland. It is a plant with trifoliate leaves, which was used by St. Patrick to illustrate the doctrine of the Trinity. The plant now generally called by the name is a hop clover (*Trifolium minus*). The wood-sorrel (*Oxalis acetosella*), the common white clover, and the black medick or nonesuch (*Medicago lupulina*) have each been identified with the original shamrock.

**Shanghai, or Shanghai,** shaang'hi': a hien or district city of the province of Kiangsu, China, and the most important emporium of foreign trade in the empire; on the west or left bank of the Hwang-pu, near its junction with the Wu-sung river, and 12 miles above its embouchure into the estuary of the Yangtse-kiang; lat. 31° 14' 42" N., lon. 121° 28' 55" E. (see map of China, ref. 6-L). In shape it is an irregular oval, surrounded by a wall 3½ miles in circuit, and pierced with seven gates. Its principal native suburb lies between the east gate and the river, and opposite this is the anchorage for junks. Except in the foreign settlement, which lies outside the north gate and stretches N. and N. E. for 2 miles along the bank of the river, the streets, both within and without the walls, are narrow and dirty. The foreign settlement consists of three so-called "concessions," known as the French, the British, and the American concessions respectively. The first mentioned is a narrow strip bounded on the N. by a canal called the Yang-King-pang; thence for three-fifths of a mile to the Wu-sung river (or Soo-chow creek, as it is called by foreigners) stretches the British settlement (the first to be laid out). Beyond this lies Hon-Kew, called the "American" settlement by foreigners, because here the first U. S. consul took up his abode. In 1863 it was incorporated with the British for municipal purposes. The French settlement has its own municipal government. There is no restriction, however, as to the nationality of residents or land-renters in any of these concessions. So efficient has been the municipal management of both that Shanghai has earned the distinction of being the "Model Settlement" of the East. The streets are well made and well kept, and are lined with imposing buildings. Those parallel with the Yang-tse road, which runs along the river bank, and is known as *The Bund*, are named after Chinese provinces, while the cross streets are named after cities. Excellent roads constructed during the military occupation of Shanghai, when threatened by the Taipings, radiate from the settlement to the W. and S., and are much used for driving, while a complicated system of creeks and canals, connecting with the Grand Canal, makes communication with the interior both easy and inexpensive.

The western half of the Settlement is occupied almost entirely by Chinese, for whose benefit a Mixed Court has been provided. In all civil, criminal, and political matters the subjects and citizens of the different treaty powers are, as elsewhere in China, subject to the jurisdiction of their own consuls, except in the cases of Great Britain and Germany, which have provided special courts.

Shanghai was first opened to foreign residence and trade in 1843, in accordance with the treaty concluded at Nanking in the preceding year, though its importance as a commercial center had long been recognized. In 1893, according to the reports of the imperial maritime customs, the gross value of the trade of the port amounted to 177,017,836 taels, or custom-house taels (= \$185,868,727 U. S. gold). This included imports of foreign goods amounting to 88,974,245 taels, imports of native produce of the gross value of 55,293,713 taels, and exports of native produce of local origin to the amount of 37,749,878 taels. The chief foreign imports are opium, cotton, and woolen goods, metals, coal, window-glass, indigo, machinery, matches, needles, sandalwood, kerosene oil, paper, sugar, soap, planks, seaweed, silk, skins, stores, and ebony and other woods. The countries from which most of the commodities were received are:

|                                       |                   |
|---------------------------------------|-------------------|
| Great Britain.....                    | 26,896,967 taels. |
| Hongkong.....                         | 20,524,125 "      |
| India.....                            | 16,729,415 "      |
| Japan.....                            | 6,296,517 "       |
| United States.....                    | 5,193,534 "       |
| Continental Europe, excluding Russia. | 4,984,866 "       |

The articles of native produce exported to foreign countries include beans and bean-cake, chinaware, cloth, raw cotton, ground nuts, Chinese drills, hemp, medicines, oil, paper, rice, raw silk, rugs, straw-braid, sugar, tea, tobacco, wax, and wheat. The shipping statistics show that in the same year 2,822 steamers, aggregating 3,147,734 tons, and 343 sailing vessels (117,151 tons) entered port; and that 2,821 steamers (3,154,379 tons) and 331 sailing vessels (110,606 tons) cleared. The population of Shanghai is estimated at 400,000, of whom about 2,000 are foreigners. R. L.

**Shan-hai-kwan** [literally, mountain-sea-barrier]: a strongly fortified town of China, pleasantly situated on the shore of the Gulf of Peh-chih-li, at the eastern end of the Great Wall. It consists of three towns separated by strong walls and surrounded by one outer wall. The large inner city is the business center; the inclosure on the E. is occupied by official and soldiers, and that on the W. by tradespeople and soldiers. The place is said to be impregnable. It is a station on the Tientsin-Mukden Railway, complete for a few miles beyond Shan-hai-kwan.

**Shannon:** the largest river of Ireland. It rises in the county of Cavan at 256 feet above sea-level, flows first S. to Limerick, then W., and enters the Atlantic through an estuary 10 miles wide at its mouth. In its course, which is 254 miles in length, it forms several lakes, viz.: Loughs Allen, Boderg, Bofin, Forbes, Ree, and Derg. Vessels of 1,000 tons burden can ascend to Limerick, and small steamers to Athlone. The river is canalized between Limerick and Killabeg, and some distance below Athlone. The Inny, Brosna, Maigue, Mague, and Deel fall into the Shannon on the left, and the Suck and the Fergus on the right.

**Shanny:** a marine spiny-rayed fish of the genus *Pholis*, or a related genus, of the family *Pholididae*. The common shanny (*Pholis pholis*), found in shoals on the coasts of England and France, is usually about 5 inches long, and is remarkable for the habit of creeping, by means of its ventral fins, out of the water into the crevices of the rocks, and there remaining until the return of the tide. It has been known to live thirty hours out of salt water, but soon dies in fresh water. The American radiated shanny (*Eumesogrammus subbifurcatus*) is found, though rarely, on the coasts of Massachusetts and New York.

**Shans:** Burmese name for the most numerous of the races of Indo-China, extending from Assam to Kwantung, and from Yunnan to the Gulf of Siam, though not occupying all this territory. They form the chief race of the Siamese, and are represented among the Miao-tse communities farther N. in Chinese territory. They probably migrated from the mountains of Sze-chuen, and appeared on the upper waters of the Irawadi about 2,000 years ago. Their languages are very similar, and they are remarkably homogeneous in appearance, manners, and customs, though much divided geographically and politically.

and hounds. One of the commonest of these in the North Atlantic is *Squalus acanthias*, with a stout spine in each dorsal. Its liver is valued for its oil. The small-spotted dogfish (*Scylliorhinus canicula*) and the large-spotted (*S. calurus*) are found on the British coast.

The so-called false sharks are species of another group, HOLOCEPHALI (q. v.). Dr. Gill, in a revision of his *Arrangement of the Families of Fishes*, allocates the families to four orders: *Opistharthri*, including *Chlamydoselachidae* and *Hexanchidae* (Notidanidae); *Prosarthri*, the *Heterodontidae* (Cestraciontidae); *Tectospondyli*, the *Echinorhinidae*, *Oxynotidae*, *Squalidae*, and *Dalatiidae* (Scymnidae); and *Astrospondyli*, the remaining families.

See Müller and Henle, *Systematische Beschreibung der Plagiostomen* (Berlin, 1841); Hasse, *Natür System der Elasmobranchier* (Jena, 1879, and suppl., 1885); and Balfour, *A Monograph on the Development of Elasmobranch Fishes* (London, 1878). See also ANGEL-FISH, DOGFISHES, FOX SHARK, and HAMMERHEAD. Revised by F. A. LUCAS.

**Sharon**: borough; Mercer co., Pa.; on the Shenango river, and the Erie, the Lake Shore and Mich. S., and the Penn. railways; 14 miles W. of Mercer, 41 miles S. S. W. of Meadville (for location, see map of Pennsylvania, ref. 8-A). It contains 2 national banks with combined capital of \$250,000, a private bank, 4 public schools, public-school library (founded in 1877), Hall Institute (Baptist, chartered in 1888), and a daily and 4 weekly newspapers. It is principally engaged in mining coal and manufacturing iron and steel, having large rolling-mills, blast-furnaces, foundries and machine-shops, and nail-factories. Pop. (1880) 5,684; (1890) 7,459.

EDITOR OF "TELEGRAPH."

**Sharon Springs**: village; Schoharie co., N. Y.; on the Del. and Hudson Railroad; 20 miles E. N. E. of Coopers-town, 59 miles W. by N. of Albany (for location, see map of New York, ref. 5-1). It is a popular summer resort in a narrow valley, 1,100 feet above sea-level, surrounded by high hills, and has four noted mineral springs—chalybeate, magnesia, white sulphur, and blue sulphur—which, with a spring of pure water, flow into a small stream below a wooded bluff W. of the village, after a descent of 65 feet over a ledge of perpendicular rocks. Pop., permanent (1880), 627; (1890) 622; summer residents and tourists exceed 10,000.

**Sharp, GRANVILLE**: abolitionist; b. at Durham, England, Nov. 10, 1734; studied law, and for several years was a clerk in the ordnance office; was the chief patron of the slave Somerset in suing for his freedom, which resulted in the famous decision against the legality of slavery in England (1772); resigned his post in the ordnance office on account of opposition to the American war Apr., 1777; devoted himself thenceforth to philanthropic objects, especially the overthrow of slavery and the slave-trade; was the first chairman of the Association for the Abolition of Negro Slavery in 1787; was the principal promoter of the colony of Sierra Leone; opposed the impressment of seamen; advocated parliamentary reform, and favored the claims of Ireland. D. in London, July 6, 1813. He was the author of sixty-one publications, chiefly pamphlets, in advocacy of the causes to which he devoted his life, philological tracts in favor of Trinitarianism, and millenarian interpretations of biblical prophecies. See his *Memoirs*, by Prince Hoare (1820) and by Charles Stuart (1836).

**Sharp, JAMES, D. D.**: archbishop; b. in the castle of Banff, Scotland, May 4, 1618; educated at the University of Aberdeen, where he figured among the students who declared against the Solemn League and Covenant 1638; became Professor of Philosophy at St. Leonard's College, St. Andrews 1643; minister of Crail, in Fifeshire, 1648; was the representative of the Presbyterians sent to Cromwell 1656, to Monk and to Charles II. 1660; was appointed king's chaplain for Scotland and Professor of Divinity in St. Mary's College, St. Andrews; consecrated Archbishop of St. Andrews and Primate of Scotland upon an Episcopalian foundation Dec., 1661; was regarded as a tool of Charles in the persecution of the Covenanters, and consequently assassinated by "a band of nine enthusiasts" on Magnus Muir, St. Andrews, May 3, 1679. Revised by S. M. JACKSON.

**Sharp, JOHN, D. D.**: archbishop; b. at Bradford, Yorkshire, England, Feb. 16, 1644; educated at Christ's College, Cambridge, on leaving which he became chaplain to Sir Heneage Finch, then attorney-general, through whom he obtained the archdeaconry of Berkshire 1672; a prebend at Norwich 1675; the rectorship of St. Bartholomew, London,

1676; of St. Giles-in-the-Fields 1677; and the deanery of Norwich 1681. He became chaplain to Charles II. and James II., by whom he was deprived of his preferments for preaching against his policy 1686. On the accession of William and Mary he became dean of Canterbury 1689, and Archbishop of York 1691. D. at Bath, Feb. 2, 1714. Seven volumes of his *Sermons* were published in 1709.

**Sharpe, SAMUEL**: Egyptologist; b. in London, Mar. 8, 1799. Though a London banker, he was best known on account of his accomplishments in the study of the Oriental languages, Hebrew, Coptic, and the Egyptian hieroglyphics. He was also a careful writer on historical subjects connected with his linguistic studies. Of his numerous works, the following are the most notable: *The Holy Bible Translated, being a Revision of the Authorized English Version* (1840); *The New Testament, Translated from Griesbach's Text* (1840; 5th ed. 1862); *History of the Hebrew Nation and its Literature* (1869; 4th ed. 1882); *Texts from the Holy Bible Explained by the Help of the Ancient Monuments* (1866; 2d. ed. 1869); *Hebrew Scriptures Translated* (3 vols., 1865); *The Chronology of the Bible* (1868); *Short Hebrew Grammar* (1877); *Inquiry into the Age of the Moabite Stone* (1879); *The Epistle of Barnabas* (1880); *History of Egypt from the Earliest Times till the Conquest by the Arabians A. D. 640* (1846; 6th ed. 2 vols., 1876; this work combines three previous publications in what was their second edition in revised form, viz.: *Early History of Egypt*, 1838; *Egypt under the Ptolemies*, 1838; and *Egypt under the Romans*, 1842); *Alexandrian Chronology* (1857); *Egyptian Mythology and Egyptian Christianity* (1863); *Egyptian Inscriptions from the British Museum* (several series, 1837-56); *Vocabulary of Egyptian Hieroglyphics* (1837); *The Triple Mummy-case of Aroeri-ao* (1858); *Egyptian Hieroglyphics: being an attempt to Explain their Nature, Origin, and Meaning* (1861); *Egyptian Antiquities in the British Museum Described* (1862); *The Decree of Canopus* (1869); *The Rosetta Stone* (1871); and *Hebrew Inscriptions from the Valleys between Egypt and Mt. Sinai* (2 parts, 1875-76). D. in London, July 28, 1881. A biography appeared in 1883, written by P. W. Claydon. CHARLES R. GILLETT.

**Sharpsburg**: borough; Allegheny co., Pa.; on the Allegheny river, and the Penn. and the Pitts. and West. railways; 5 miles N. E. of Pittsburg (for location, see map of Pennsylvania, ref. 5-B). It is in a coal-mining region, and contains rolling-mills, blast-furnaces, foundries, a State bank with capital of \$50,000, and two weekly newspapers. Pop. (1880) 3,466; (1890) 4,898.

**Sharpsburg**: a village in Washington co., Maryland; lying between the Antietam and Potomac rivers (see map of Maryland, ref. 2-D). It was the scene of the battle of Antietam Sept. 17, 1862. Pop. (1890) 1,163. See ANTIETAM.

**Sharpsville**: borough (organized in 1874); Mercer co., Pa.; on the Shenango river, and the Erie, the Penn., and the Sharpsville railways; 3 miles N. E. of Sharon, 11 miles S. S. W. of Greenville (for location, see map of Pennsylvania, ref. 8-A). It is in a coal-mining region, is engaged in the manufacture of pig iron, and contains 7 churches, 2 public-school buildings, a private bank, and a weekly newspaper. Pop. (1880) 1,824; (1890) 2,330; (1895) estimated, 3,000.

EDITOR OF "ADVERTISER."

**Shashanq**: See SHISHAK.

**Shasta, Mount**: See ROCKY MOUNTAINS.

**Shas'tra** [from Sanskr. *śāstra*, order, command, sacred book, deriv. of *śā-*, order, instruct, govern]: a name applied to the authoritative books of the Hindus upon religion and civil and religious law. The principal works of this class are collectively called *Dharma-śāstra*, or "Law Shashtra."

**Shatt-el-Arab**: See EUPHRATES.

**Shaw, ALBERT, Ph. D.**: journalist and author; b. at New London, O., July 23, 1857; graduated in 1879 at Iowa College, Grinnell, Ia.; became a journalist in Iowa; also studied at Johns Hopkins University; in 1883 became connected with the Minneapolis *Daily Tribune* as an editorial writer, but completed his work at Johns Hopkins, and received from that institution in 1884 the degree of Ph. D.; returned to Minneapolis and became chief of the editorial staff of the *Tribune*, which position he held until 1891, with the exception of a year and a half (1888-89) in Europe, which was devoted largely to the study of municipal government. He declined professorships in several colleges, and in 1890 became the founder and editor of the American edition of

fifteen volumes of grammars and dictionaries of Indian languages (1860-74); edited *The Historical Magazine* (1859-65); and published *The Catholic Church in Colonial Days* (1883); *The Hierarchy of the Catholic Church in the United States* (1886); *Life and Times of Archbishop Carroll* (1888); and three of five projected volumes on *The History of the Catholic Church in the United States*. D. at Elizabeth, N. J., Feb. 22, 1892. Revised by G. J. HAGAR.

**Sheaffe**, Sir ROGER HALE: soldier; b. in Boston, Mass., July 15, 1763; obtained a commission in the British army, 1778, through Earl Percy, whose headquarters had been at his mother's house in Boston three years before; served in Holland 1799, and in the expedition to the Baltic 1801; served in Canada 1802-11, and again 1812-13; had risen to the rank of major-general in 1811; took command of the British forces at the battle of Queenstown, after the death of Gen. Brock, and succeeded in inflicting a serious defeat upon the American invaders, for which service he was made a baronet Jan. 16, 1813; defended York (now Toronto) against the attack of Apr., 1813; became full general in 1823, and colonel of the Thirty-sixth Regiment in 1829. D. in Edinburgh, July 17, 1851.

**Shearman**, THOMAS GASKELL: lawyer and writer on economic subjects; b. in Birmingham, England, Nov. 25, 1834. His parents removed to New York when he was nine years of age; he was educated privately; was admitted to the bar in 1859; has practiced law for many years in New York and Brooklyn; was counsel for Henry Ward Beecher in his trials; Republican in politics from 1858-80; since 1880 has devoted most of his time, outside of business, to the propagation of free-trade ideas, always declining public office; joint author of *Law of Practice and Pleadings* (1861-65); *Law of Negligence* (four editions, 1870-88); and author of *Talks on Free Trade* (1881); *Does Protection Protect?* (1883); *Pauper Labor of Europe* (1885); *Distribution of Wealth* (1887); *The Single Tax* (1887); *Henry George's Mistake* (1889); *Who Own the United States?* (1889); *Crooked Taxation* (1890); *Natural Taxation* (1891).

**Shearwater**: any one of several birds of the genus *Puffinus*, and the family *Procellariidae*. The greater shearwater (*Puffinus major*) is from 18 to 20 inches in length, and the Manx shearwater (*P. anglorum*) about 15. They are often seen hundreds of miles from land. The majority are brown or cinereous above and white below; but the sooty shearwater (*P. fuliginosus*) is an almost uniform sooty brown; the tail is rather long and rounded; the feet large; the tarsus shorter than the middle digit; the nasal tubes are short, flat, and obliquely truncated, instead of being pronounced, as in the true petrels. See *PROCELLARIIDÆ*.

Revised by F. A. LUCAS.

**Sheathbill**: any bird of the family *Chionididae*. Only two species are known, and both are inhabitants of the southern hemisphere—one, *Chionis alba*, being native to the Falkland islands, etc., and the other, *Chionis* or *Chionarchus minor*, peculiar to Kerguelen's island. Much difference of opinion has prevailed among naturalists respecting the relations of these birds to others in the class, some having regarded them as waders (*Grallæ*), others as swimmers (*Longipennes*), and others still as gallinaceous forms. They are now generally placed with the waders, near the peculiar plover-like *Glareola*, but they also have undoubted affinities with the gulls. In their economy and habits they strongly resemble pigeons and fowl; according to Kidder, who studied the species of Kerguelen's island in life, the "observer is first struck by the strong resemblance which *Chionis* bears to the pigeons in general appearance, gait, and mode of flight. The general shape of the body is of an ordinary columbine character, the head being notably small, as usual in that group, the neck short and full, and the body plump; the tail, moreover, having but twelve rectrices." "The feet, in almost every particular, are thoroughly gallinaceous, even to the character of the marginal fringe of the toes." In color, however, they recall rather the characteristics of the gulls than of either gallinaceous or columbine forms. "On the other hand, the bird's omnivorous diet, habits under confinement, easy domestication, dislike of water, entire inability to swim, and many other points in its habits are strongly gallinaceous characteristics, by so much removing it from the vicinity of either grallatorial or natatorial birds." Nevertheless, the indications furnished by the skeleton outweigh all such superficial correspondences, and conclusively prove that the birds in question are derivatives from gull-like (and therefore primarily natatorial) types, but modified for terres-

trial life. They are omnivorous in diet, feeding upon vegetable substances (seaweeds, etc.), molluscs, and eggs. *Chionis alba* has a total length of 17 inches or more, and *C. minor* about 14 or 15 inches. They are called white paddy by whalers.

Revised by F. A. LUCAS.

**Sheathing**: a covering for a ship's bottom, made of sheet copper, and first introduced about 1800. It not only serves to protect wooden ships from boring-shrimps, teredos, and other small destructive animals, but to a great extent it prevents the fouling of the bottom by seaweeds and barnacles.

**Sheba**, or **Saba** [from Heb. *Shvāhā*, or *Shebhā*: cf. *shebhā*, seven]: the name of three persons in the Old Testament: (1) A great-grandson of Ham (Gen. x. 7), who appears to have settled somewhere on or near the shores of the Persian Gulf. (2) The tenth of the thirteen sons of Joktan (Gen. x. 28), who settled in Southern Arabia, and gave his name to the kingdom of the Sabæans, whose queen visited Solomon in Jerusalem (1 Kings x. 1-13). (3) A grandson of Abraham and Keturah (Gen. xxv. 1-3), whose descendants were nomads, in close connection with the descendants of the Hamitic Sheba mentioned above. The same name in a slightly different form occurs in the Old Testament as that (4) of the Benjamite who revolted against David, was defeated by Joab, and beheaded by the people of Abel-Beth-maachah, where he had taken refuge; (5) of a Gadite (Chron. v. 13); and (6) of a town in Simeon.

Revised by S. M. JACKSON.

**Sheboygan**: city (settled in 1836, chartered as a village in 1846, incorporated as a city in 1853); capital of Sheboygan co., Wis.; on Lake Michigan, at the mouth of the Sheboygan river, and on the Chi. and N. W. Railway; 52 miles N. of Milwaukee, and 137 miles N. of Chicago (for location, see map of Wisconsin, ref. 6-F). It has an excellent harbor and a large lake commerce, particularly in lumber, coal, and tan bark. A line of steamers connects the city with Milwaukee, Chicago, and other points on the lake, and the railway and its branches make the city the trade-center of a large and rich agricultural region. There are two public parks, one of which, Fountain, contains an artesian well, whose waters are strongly impregnated with mineral salts and form an important article of commerce. The city is lighted by gas and electricity, derives its supply of water from the lake, is well sewered, and has an efficient street-railway service. Among the public institutions are 15 churches, high, grammar, intermediate, and primary schools, kindergartens, Roman Catholic and Lutheran parochial schools, Day School for the Deaf, hospital, insane asylum, and Home for the Friendless. In connection with the public schools is a library of 3,000 volumes. There are 2 State banks with combined capital of \$300,000, and 3 daily and 7 weekly newspapers. The assessed valuations in 1892 aggregated \$5,415,980. Sheboygan is particularly noted for the manufacture of chairs and other furniture. There are 5 chair-factories, which employ about 2,000 persons and turn out 7,000 chairs per day. About 40,000 feet of lumber are used daily in the manufacture of furniture. The various manufacturing industries employ about 5,500 persons, who receive in wages about \$225,000 per month. Other important establishments are 2 manufactories of enameled ware, 2 boot and shoe factories, 3 foundries and machine-shops, 2 tanneries, 2 carriage-factories, 2 breweries, and manufactories of toys, office and hotel furniture and fixtures, venetian folding-beds, venetian-blinds, wire-mattresses, and excelsior bottle-wrappers. There are also dry docks, brick-yards, lime-kilns, a ship-yard, and 5 large cheese-warehouses. Pop. (1880) 7,314; (1890) 16,359; (1894) 21,018. J. E. RIORDAN.

**Shechem**: See *NABLUS*.

**Shechi'nah** [from Late Heb. *shekhināh*, dwelling, presence, deriv. of *shākhan*, dwell]: a name which first appears in the Jerusalem Targum to designate the Divine Presence wherever it exists in a special manner, but more particularly as manifested in the holy of holies within the ancient sanctuary of Israel.

**Shedd**, WILLIAM GREENOUGH THAYER, D. D., LL. D.: theologian; son of a clergyman; b. at Acton, Mass., June 21, 1820; graduated at University of Vermont in 1839, and at Andover Theological Seminary in 1843; was pastor of the Congregational church in Brandon, Vt., 1844-45; Professor of English Literature in the University of Vermont 1845-52; Professor of Sacred Rhetoric and Pastoral Theology at Auburn Theological Seminary 1852-53; Professor of Ecclesiastical History and lecturer on pastoral theology in And-

sought for in all the mutton breeds. Medium-sized lambs of quick development, compact build, and good quality stand high in favor in the markets, and they can be raised at a minimum of cost. It is generally considered more profitable to dispose of them before they pass the age of one year.

THOMAS SHAW.

**Sheepshead:** a well-known fish (*Archosargus probatocephalus*) of the family *Sparidae*, found along the Atlantic coast of the U. S. south of Cape Cod, but most abundant in the warmer waters. The name is given in allusion to a fancied resemblance of the head to that of a sheep, produced by the form and color as well as the cutting teeth of the jaws. The body is deep and robust with the back arched; the dorsal fin has twelve spines and eleven rays, and is preceded by a recumbent spine; the anal fin has three spines and ten rays; the color is gray, with about seven blackish bands; the front teeth are broad and incisor-like, the lateral teeth molars, and in several rows. The sheepshead sometimes exceeds 2 feet in length, although averaging less. It is one of the most esteemed fishes found in American waters, and on account of the delicacy of its flesh has been likened to the English turbot. It is also highly regarded as a game-fish. It feeds chiefly on molluscs and crustaceans, and its molar teeth and stout jaws are eminently adapted for breaking shells. The fresh-water drum (*Haplodinotus grunniens*) is among the fishes loosely called sheepshead in the U. S.

**Sheep-tick:** a wingless parasitic insect (*Melophagus ovinus*) of the order *Diptera* and family *Hippoboscidae*, often extremely annoying to sheep. There are various arsenical washes which will destroy them; a solution of carbolic acid is also recommended for the purpose.

**Sheeraz:** See SHIRAZ.

**Sheerness:** a strongly fortified seaport in Kent, England; on the right bank of the Medway, at its junction with the Thames; 52 miles by rail E. of London (see map of England, ref. 12-L). The harbor is safe and commodious, and, being almost at the mouth of the Thames estuary, is often crowded with vessels. The Government dockyard, with wet and dry docks, storehouses, etc., covers 60 acres. The principal trade is due to the oyster-fisheries. Sheerness is also a favorite summer resort. Pop. (1891) 13,841.

**Sheffield:** town; in the West Riding of Yorkshire, England; at the junction of the Sheaf and the Don; 41 miles E. of Manchester and 165 miles N. N. W. of London (see map of England, ref. 7-H). It is situated at the foot and on the slopes of a range of hills, and is generally well built, a street-improvement scheme having been carried out after 1875. Noticeable among its public buildings are the parish church of St. Peter, erected in the reign of Henry I.; St. Mary's Roman Catholic church (1850); the Cutlers' Hall, the Albert Hall, the new market-hall (1851), and the new town-hall, crowned with a statue of Vulcan. Among educational institutions are the Firth College (1879), with thirteen professors or lecturers, the Technical School, the Wesley College, and the Free Grammar School. The St. George's Museum, founded by Ruskin in 1890, contains a collection of engravings, minerals, etc., and the Mappin Art Gallery has a fine collection of pictures. There are several public parks and extensive botanical gardens. The cutlery business of Sheffield dates from very early times. The Sheffield whittle of Chaucer was the common knife used by those whose social rank did not permit them to carry a sword. The Cutlers' Company was founded in 1624, but Sheffield was of little importance up to the middle of the eighteenth century. Sheffield Castle, rebuilt in 1270, was the place of imprisonment of Mary Queen of Scots (1572-86). It was taken by the parliamentary army in 1644, and shortly afterward was demolished. Sheffield is the center in England of the manufacture of knives, files, saws, carriage-springs, boilers, stoves, grates, buttons, and all kinds of agricultural, mechanical, medical, and optical instruments. Silver-plating and britannia metal were both invented here, and have given rise to a comprehensive manufacturing industry. Since 1871 rails, railway-springs, tires, steel blocks for naval and military artillery, and armor-plates have been largely manufactured. Sheffield returns five members to Parliament. Pop. (1894), 338,316.

R. A. ROBERTS.

**Sheffield:** city (founded in 1884); Colbert co., Ala.; on the Tennessee river, and the Birm., Shef. and Tenn. Riv., the Louisv. and Nashv., and the Memphis and Charleston railways; 2 miles W. of Tusculum, the county-seat (for location, see map of Alabama, ref. 1-B). It is in an agri-

cultural region, and contains 8 church organizations, several public schools, 5 blast-furnaces, and 2 weekly papers. Pop. (1890) 2,731; (1894) about 1,200. EDITOR OF "REAPER."

**Sheffield, JOHN,** Duke of Buckinghamshire and Normanby; statesman and poet; b. in England in 1649; succeeded his father as Earl of Mulgrave 1658; served in the Dutch wars of 1666 and 1672; became privy counselor and lord chamberlain in 1685; favored the revolution of 1688; was made Duke of Normanby in 1694, lord privy seal and Duke of Buckinghamshire in 1703, and built in St. James's Park the residence now known as Buckingham Palace and belonging to the crown. He was said to have been an early lover of Queen Anne; was author of some poems which enjoyed fame during his own generation, and was a friend of Dryden, to whose memory he erected a monument in Westminster Abbey. D. Feb. 24, 1721. Besides minor poems he wrote a metrical *Essay on Satire* and an *Essay on Poetry*. His poetical works were first printed in 1723.

**Shehâb-Eddin:** See CHEHAB-EDDIN.

**Shehr, or Sahar:** town; in South Arabia, on the Gulf of Aden; manufactures coarse cotton cloth, and carries on a brisk general trade, though it has no harbor, but only an open roadstead. Pop. probably 5,000. Four miles E. remains of another town of the same name, once important, but now a decayed fishing-village.

E. A. G.

**Sheik** [from Arab. *sheikh*, *shaykh*, elder, venerable, man, chief, deriv. of *shākha*, grow old, be old]; a title among Arabs applied to the head of a tribe. Among Mussulmans in general it is prefixed to the name of a religious dignitary, or one versed in theology, or a reputed saint.

**Sheikh-ul-Islam:** See MUFTI.

**Shell, RICHARD LALOR:** patriot and orator; b. at Drumdowney, Tipperary, Ireland, Aug. 17, 1791; was educated at the Jesuit College, Stonyhurst, England, and graduated at Trinity College, Dublin, 1811; studied law at Lincoln's Inn; was called to the bar at Dublin 1814; wrote several successful dramas; contributed *Sketches of the Irish* to Campbell's *New Monthly Magazine*, republished in the U. S. by R. S. Mackenzie (New York, 2 vols., 1854); became an effective popular orator in the agitation for Roman Catholic emancipation; was chosen by the Catholic Association in conjunction with O'Connell, to represent that body at the bar of the House of Lords 1825; was active in promoting the election of O'Connell to Parliament in 1828; was himself chosen member for Milburne Port shortly after the passage of the Relief Act 1829; was returned for the county of Louth 1831, and later for Tipperary and Dungarvan; became noted as a brilliant and effective parliamentary orator, and aided O'Connell for several years in his campaign for the repeal of the Union, until 1838, when he accepted the sinecure post of commissioner of Greenwich Hospital. He subsequently became vice-president of the Board of Trade, member of the privy council 1839, and judge-advocate-general 1841; was master of the mint 1846-50, and was appointed minister to Tuscany 1850. D. in Florence, May 2, 1851. His *Memoirs* were written by W. Torrens McCullagh (2 vols., 1855); a collection of his *Speeches* was published in London, 1845, and his *Speeches, Legal and Political*, in 1855. —His younger brother, Sir JUSTIN SHELL, became major-general and minister to Persia, and aided his wife in the preparation of a valuable work, *Glimpses of Life and Manners in Persia* (1856).

Revised by H. A. BEERS.

**Shekel** [from Heb. *sheqel*, shekel (liter., a weight, deriv. of *shāqal*, weigh; cf. Gr. *σίκλος*, shekel); a standard weight among the ancient Israelites, and also a coin of gold, silver, or copper, originally of a shekel's weight. The shekel of the sanctuary (Ex. xxx. 13; Num. iii. 47) was made of silver and was equal to 20 gerahs (Ezek. xlv. 12), or about 54 cents. There were other kinds of shekels. The gold shekel was worth about \$5.69; the copper shekel, a little more than 3 cents.

Revised by S. M. JACKSON.

**Shelburne:** a seaport; capital of Shelburne County, Nova Scotia; 141 miles S. W. of Halifax (see map of Quebec, etc., ref. 8-B). It has a very fine harbor. Shelburne Light on Cape Roseway, are in lat. 43° 38' N., lon. 65° 15' W. There is excellent water-power, afforded by the river Roseway. Fishing, commerce, and ship-building are extensively pursued, and the port is one of the best in the province. The place has lost greatly in importance. During the war for American independence it was the center of loyalist influence, and then had about 12,000 inhabitants. Pop. 2,500.

Shelley, James, first Governor of Kentucky; b. near Louisville, Ky., Dec. 11, 1764; son of Gen. Evan Shelley; received a thorough classical education; became a surveyor in 1784; a member of the Kentucky bar in 1787; a company commander in the battle of Point Pleasant 1774; a major-general 1784; a commissioner of the frontier 1777; a member and speaker of the Virginia House of Delegates 1779; and 1780; received distinguished service at King's Mountain Oct. 3, 1780; married Miss Marion 1781, and had a family of 10 children and numerous soldiers 1783-92, in which he was sent to the North Carolina Long staffs, from which he received a vote of thanks and a sword, settled in Lexington, Ky. (then Virginia), 1788; was a member of the first council came about 1791, Governor of Kentucky and served 1814-36; joined Gen. Harrison at Canada 1812 and distinguished record by his command in & part in the battle of Tippecanoe, for which Congress voted him a gold medal; appointed to post of Secretary of War 1815, and was afterwards with Gen. Jackson in negotiating a treaty with the Chickasaw Indians 1818; *He is* Translated into English by W. Barclay in 1920. His services as commissioner of the council at Lexington in 1800 of the Western and Southern States, and as the command a college at Shelbyville, Tenn. His son James b. 1784, served as major in the war of 1812; he was a well educated and died in Sand. 1846.

[illegible]

**Shelbyville** is the capital of Shelby co. Ind.; on the Ohio river, and the Chicago, Cincinnati and St. Louis and the Chicago, Erie and St. Louis railroads; 24 mi. S. N. E. of Evansville; on the N. W. of Indianapolis; the leading seat of agriculture and stock raising in the county. It is a well-merited resort for the summer, and has many fine parks, gardens, and a fine collection of art, etc., and a series of musical lectures are given there. It is a public school town. A hospital

**Shelbyville** (town), capital of Shelby co., Ky., on the Louisville and Nashville and the Southern railroads, 20 miles W. of Frankfort. Altitude 115 ft. (Lansdown). One of the largest cities of Kentucky and S. Ky. It is situated on a high, sloping bank of the Mississippi, growing, wheat and corn raised. State bank, with an academy and lot. **SHelbyville** 2 weeks in 1890-1891. St. Louis and School. **SHelbyville** 1 post-office, monthly, up and down, 1890-1891. **SHelbyville** 1 college, founded in 1840, and **SHelbyville** Med. Academy, 1890. **SHelbyville** 1890-1891, 1890-1891, 1890-1891, 1890-1891.

**Shelbyville**, town, capital of Bedford co., Tenn., on the Paduca River; and the Nashville, Chattanooga & St. Louis Railway, 60 miles E. S. E. of Columbus, Ill.; on the N. W. corner of the county. See map of Tennessee, vol. I, p. 19. It is an important grain and stock-raising community. In 1870 it had a large iron-works and a foundry. In 1890 a national bank with capital of \$100,000 was organized with a capital of \$200,000 and a monthly and three-monthly newspaper, and has a lumber, a machine and paper factory, sugar-lumber yards, tanneries and a saw-mill, ship, cotton and woolen mills and flour, meat and planing mls. It is a shipping point for telegraph and telephone poles and paraphernalia. The town and its vicinity were the scene of numerous military operations in 1862, 1863, 1864 and 1865. Pop. (1890) 4,961. (Engl. B. 221.) (1907 estimated with annexed area.)

**Sheldon, Rowland Alexander, A. M., Ph. D.**, scholastic leader, Perry Center, N. Y., Oct. 4, 1922; received at Hamilton College, Clinton, N. Y.; superintendent of schools, Syracuse, N. Y., Apr. 1951-Apr., 1953; superintendent of schools, Oswego, N. Y., May, 1953-Sep., 1960; principal of Oswego State Normal and Training School since 1940. Author of *Manual of Elementary Instruction* (1952); *Lessons on 100 facts* (1957); and a four-book set of second book chapters, C. H. T.

**Sheldon, Edward** 1871-1959, Ph. D., phonologist. B. at Waterville, Me., Nov. 21 1871. Studied in Waterville and Colby University; graduated at Harvard 1875; studied at Berlin, Leipzig, and Paris 1874-77; assistant in zoology and anatomy at Harvard 1875-84; Assistant Professor of Zoology and Phonology at Harvard 1884-90; appointed editor and postmaster 1890; secretary of the American Philological Society since its organization, 1890. His work has chiefly been in the field of phonetic and historical phonology, particularly as relative to the European languages. He has also done much in lexicography. The first edition of the *Living Language of America*, Aushen of *A Short Treatise on Epigraphy* (1876), *Short Systems of a Universal French Phonetic System* in *Metre*, in *European Music*, *Language*, *Music* (1877); etymologies in Webster's *International Dictionary* (1890); *Origin of the English Syntax of the Letters in Harvard Studies and Notes* is cited in 1893; 1894; also various articles in the *Modern Language Notes*, the *Transactions of the Modern Language Association of America* and *The Modern Notes*. D. J. W.

**Sheldon, Graham**, b. 13; childhood; B.A. Oxon., Oxf. Univ., England, July 10 1938; graduated at Oxford 1917; was Fellow of All Souls' College 1922; obtained the degree of Bachelor 1924, and the degrees of Doctor and Newtonian; was appointed warden of All Souls and candidate to Charles J. May, 1935; was elected from the second step and progressed far beyond to the next rank 1937-38, based on decision until the retirement; became Bishop of London 1939, Archbishop of Canterbury, 1960, and Chancellor of Oxford University 1967 and held for that position, 1968-69; f. 1969; the famous Sheldonian chapel, opened 1969. D. at Lambeth Palace, Nov. 6, 1971.

**Sheldon Henry Levy** (b. D.: pianist and educator; b. Newburgh, N.Y., Mar. 12, 1896; received at Cornell University, Ithaca, CA, B.S., 1917; Boston University, S.F.B., 1921); and Leipzig University, music theory and Music Conference of the Methodist Episcopal Church, 1922; member of Music-Wisconsin Society, 1924-29, president.

professor (1876-82) and Professor (since 1882) of Historical Theology in Boston University. He has published *History of Christian Doctrine* (2 vols., New York, 1886) and *History of the Christian Church* (5 vols., 1894). A. O.

**Sheldrake, or Shieldrake** [*sheldrake* is from Eng. *sheld*, variegated, spotted + *drake*; cf. O. N. *skjöldungr* (< *skjöldr*, a patch): *shieldrake* is identified with the secondary meaning of *skjöldr*, shield, given in allusion to the markings on the breast]: a river-duck of either of the genera *Tadorna* and *Casarca*. The common sheldrake (*Tadorna tadorna* or *cornuta*) is about the size of a goose, and has a red bill with a basal protuberance, head and neck green, with a white collar below, and a brown belt extending across the upper portion of the back. The shoulders and a median abdominal stripe are black, the speculum is green, and the rest of the plumage is white. It is found on sandy seacoasts in the Old World, making nests lined with down

The common sheldrake of Europe.

in abandoned rabbit-burrows. The ruddy sheldrake or Brahminy duck (*Casarca rutila*) is found mostly in South-eastern Europe and in Asia. *Casarca tadornoides* and *C. variegata* inhabit Australia and New Zealand respectively, and are plain-colored. The so-called sheldrakes of North America are mergansers.

**Shellac, or Shell-lac:** See LAC.

**Sheller, ALEKSANDR MIKHAILOVICH:** author; b. in St. Petersburg, Russia, July 30, 1838; educated at the university in that city; interested himself in questions of popular education, and founded a school for the poor which, at first very successful, incurred the suspicions of the Government and came to an end in 1863. In the same year he published his earliest verses, and in 1864 *Gnilyta Bolota* (Dank Marshes), a novel that had numerous successors, among the best of which are *Khleba i Zrelisch* (Bread and Amusements); *Des rubtal-Shechepki lettat* (When Wood is cut Splinters fly); and *Chuzhie Grekhi* (The Sins of Others). In 1877 he became editor of the *Zhivopisnoe Obozrenie*; he has also written on questions of religion and sociology, and is especially known for a *History of Communism* in three volumes. A. C. COOLIDGE.

**Shelley, MARY WOLLSTONECRAFT (Godwin):** author; daughter of William Godwin and Mary Wollstonecraft; b. in London, England, Aug. 30, 1797; educated in accordance with the peculiar social theories of her parents; married the poet Shelley Dec. 30, 1816, after having lived with him two years previously to the death of his first wife. She was the author of *Frankenstein, or the Modern Prometheus* (1818), a singular novel, displaying great power, of *Valperga* (1823), *Lodore* (1835), and other less successful romances; contributed to *The Cabinet Cyclopaedia* a series of biographies of eminent literary and scientific men of France, Italy, and Spain, and edited the works of her husband, with biographical prefaces and notes (1839-40). D. in London, Feb. 21, 1851. See the *Life* by Mrs. Julian Marshall (2 vols., 1889).

Revised by H. A. BEERS.

**Shelley, PERCY BYSSHE:** poet; b. at Field Place, near Horsham, Sussex, England, Aug. 4, 1792. His grandfather, Bysshe Shelley (b. at Newark, N. J., 1731), acquired a large fortune, was made a baronet in 1806, and died Jan. 6, 1815.

His father, Timothy, b. Sept., 1753, married, in 1791, Elizabeth, daughter of Charles Piffold, of Effingham, Surrey. The domestic surroundings of the poet were unfortunate, neither of his parents having given him suitable training or inspired him with affection—a circumstance to which much of the waywardness of his career may be attributed. He received his early education at a school taught by the parish clergyman at Warnham; entered at the age of ten St. Ann's School, Brentford, where he was noted rather as an insatiable reader than as a successful student; entered Eton College in 1805; was addicted to experiments in chemistry; read much upon ghosts and the "occult sciences"; was careless of his tasks, but translated half of Pliny's *Natural History* for his own satisfaction; wrote an incredible amount of fragmentary verses, mostly "poor stuff," as he afterward perceived; composed, with his cousin Medwin, one or more plays and novels, and with another cousin, Harriet Grove (of whom he was deeply enamored), a romance entitled *Zastrozzi*, which was printed in 1810, and, strange to relate, brought him £40; printed also a volume of poems, "by Victor and Cazire," which he quickly withdrew from circulation, and of which no copy is known to be extant, and another romance, *St. Irvyne*, all within the same year (1810) in which he entered University College, Oxford; published under the pseudonym of *Margaret Nicholson* a volume of burlesque poems; was expelled from his college Mar. 25, 1811, for having printed a pamphlet entitled *The Necessity of Atheism*; went to London with his friend Hogg, who was also expelled in connection with the same affair; was left without support by his offended father, but received occasional supplies from the savings of his sisters, then at school; eloped to Scotland with one of their schoolfellows, Harriet Westbrook, the beautiful daughter of a retired innkeeper, and married her in Edinburgh, Sept., 1811; effected a settlement with his father, by which he received a small annuity; traveled with his wife to York and Keswick, where he met Southey and perhaps De Quincey; proceeded to Dublin, Feb. 12, 1812, where he printed three revolutionary pamphlets, addressed one or more political meetings, and fancied that he had been requested by the police to leave the city; went to the Isle of Man, to North and South Wales, Devonshire, and Carnarvonshire, making but brief residences at any point, after flying visits to Dublin and Killarney, finally settled in London, May, 1812; printed early in 1813 *Queen Mab*, his first poem of real literary merit, a production strongly tinged with anti-religious fanaticism. His first child, Ianthe, was born in June, 1813. Shelley was remarried in London, Mar. 24, 1814, but soon found his married life uncongenial; separated from his wife, settling upon her nearly all his disposable income, and about this time conceived a passion for Mary Godwin (daughter of William Godwin and Mary Wollstonecraft), which was fully returned. As neither of them had any respect for the marriage bond, they saw no difficulty in consulting their own inclinations, and proceeded to Switzerland, traveling as man and wife; returned to England at the close of 1814. In consequence of the death of his grandfather he obtained an annuity of £1,000 and his father's succession to the baronetcy (Jan., 1815); studied surgery during the winter of 1815-16, and daily walked a London hospital; wrote in 1815 his second poem of permanent interest, *Alastor, or the Spirit of Solitude*, published, with other poems, in 1816; proceeded to the Lake of Geneva in the spring of 1816; resided there some months in daily intercourse with Byron; returned to London in the autumn; legalized his connection with Mary Godwin by marriage Dec. 30, 1816, Harriet having shortly before (Nov. 10) drowned herself in the Serpentine; conducted an unsuccessful chancery suit against Mr. Westbrook (Harriet's father) for the custody of his two children, decision being given against him by Lord Eldon on the ground of atheism Aug. 23, 1817; settled at Great Marlow, Buckinghamshire, where he played the part of a country gentleman; made about this time the acquaintance of Keats and the brothers James and Horace Smith, and became very intimate with Leigh Hunt; published in 1818 *The Revolt of Islam* (originally called *Laon and Cythna*), a grandly conceived, sublime, and highly original poem, but with many inequalities and blemishes; suffered much from pulmonary disease, which led him in Mar., 1818, to leave England for the last time; traveled with his early friend Hogg to Italy, residing successively at Milan, Pisa, Leghorn, and the Bagni di Lucca; visited Byron at Venice, remaining there some weeks; completed *Rosalind and Helen* (published 1819), a poem of little value; translated, or rather abridged, the *Symposium* of

[illegible]Reviewed by Shirley Ann Thomas.

Shell-heaps, animal deposits constituting a leading source of organic material remains of South America, and one of the most important for all kinds of studies.

Shells and *Arca*. Fine, deep-sea shells are the common mollusks of the interesting people, and their contents vary with the nature of the food supply. They, clams, mussels and numerous varieties of univalves yield a very large amount of compact and durable refuse. In some cases the shape and height of the bays were modified for domestic and defensive purposes and when the sites became the seat of a settlement the shells were utilized in building houses, but they are found here only as accumulations of refuse, far from the fine mass reliable records of the food habits, the customs, arts, industries, and movements of the people. Scores of these bays cover areas 10, 20, or even 50 acres in extent. On the shores of some of the Atlantic coast bays the deposits are practically continuous for many miles and finally back from the water for distances of many miles, a few feet to half a mile or more according to the nature of the ground. It is estimated that in the State of Texas alone the oyster-banks cover an area of upward of 100,000 acres. The deposits are heaviest where favorable currents are encountered in profile shallows, and it is not uncommon to find them from 10 to 25 feet deep. A depth of 10 feet is occasionally reported, and certain deposits in Texas are said to be 100 feet deep. The shells on the oyster-banks are a deep rich oyster, and where decay is well into the shells the deposit are exceedingly fertile. In many cases the shells were placed on sites and covered by a layer

A. Mays's Creek, Mich., a single or false tree stands out of place in a forest of oaks suitable for this purpose. *Manis* and *Agave*.—To see under the small-leaved *Manis* are a few trees from which they could be taken as representing a simple and rather hard forest of oaks and manis in Florida, especially the fresh-looking young trees, the latter depositing, as well as more or less, according to the lower beds, indicating a more gradual deposition and considerable lapse of time, while the more bushy and undulating of the younger and the more leafy of the *Manis* would be 100 years

could never be composed of anything so momentary that I feel bound to state the circumstances under which some of the records are assumed to have passed since their accumulation by the Bureau of Entomology and Plant Quarantine will not so well illustrate the general conditions on which the records are made. In some instances the forms of life offered by the natural food plants have changed in character or have seasonally decreased in abundance or size or have entirely disappeared. These changing conditions are an index of age but not a defect or variability one. In the matter of species of animals, when remains occur in these artificial deposits one finds it with an ease but that from the living or historic species at the location in which they occur.

*Art and People.*—The American visitors who resorted to the shores of the sea to search for food, and not a peaceful people, and did not belong to a particular period of time or stage of culture. Some of the most advanced and civilized people came past the interior of the country and took no part in the interior history, but merely all grades of culture at represented in the art of those periods. In some regions the Indians resorted to the fisheries at several successive ages, and in such cases the relics left do not fully represent the art of the people. The animals and implements were to a large extent prepared for temporary and local use, and are geographically mixed, but in passing along the coast from Maine to Mexico the artificial contents of the shell lands of each section represent somewhat fully the art resources of the adjacent regions. For example, rude wood-carved pottery is found in the northern islands, stamped ware in southern, painted ware in those of the Gulf States, and highly elaborated and artistic ware in the deposits of the western and southern Gulf shores. The art and people represented by the potteries, hence, certainly are those of which limited value has been obtained through other sources.

**Shelly's Case.**—a celebrated case at law, decided in 1840, and reported in the first part of *Lord's Cases Reports*. It constitutes one of the landmarks of the English law of property, and established a technical rule of real property law known as the Rule in Shelly's Case, which may be stated as follows: When a person takes an estate for life, under a deed or will, and in the same instrument there is a limitation by way of remainder to his heirs, or to the heirs of his body as a class of persons, the limitation to the heirs merely operates to enlarge the estate of the person to whom the life-estate is given; if the remainder be to the heirs of his body, he takes an estate for life tail; if to his heirs generally, an estate for fee simple. The rule had two applications, however, to the limitation of a remainder to any particular person, who might, nevertheless, in the deed of the life-tenant. Thus a limitation of a life-estate to A, with remainder to his eldest son and the heirs of the issue, was not within the rule. The rule itself has been abrogated by statute in New York and many other States, and in such jurisdictions a limitation of this kind effected as it would otherwise effect according to the terms of the conveyance. See *ESTATE, FEE, REMAINDER, RESTAINTION* and consult text-books on real property, especially LEASE and WILLING and the *Commentaries of Blackstone* and Kent.

DANIEL W. HARRISON.

[illegible]

**Shelter Island:** island and town; Suffolk co., N. Y., between the Peconic and Orientals Bays; near the western extremity of Long Island (for location, see map of New York, vol. 8, fig. 1). It is reached by ferry from Greatport on the Long Island Railroad; is about 14 miles long and 1 mile wide; contains several pretty bays and small fresh-water lakes; is a popular summer resort and a Maritime summering place; and has two large hotels and many facilities for boating and fishing. The island (though long-erected to the Northmen tradition, was acquired by Lord Stirling) and for many years was under the jurisdiction of Greatport. Pop. (1900) 700. (1900) 700.

**Shema'kha** (anc. *Kamachia*): town of Russia; in Transcaucasia; on the Pirsaghut, at an elevation of 2,230 feet. It is fortified, and has large and well-stocked bazaars and manufactures of silk and cotton stuffs. Much wine and fruit are produced in the vicinity. Pop. (1892) 22,139.

**Semitic Languages**: same as SEMITIC LANGUAGES (q. v.).

**Shenando'ah**: town (founded in 1870); Page co., Ia.; on the Nishnebotne river, and the Burlington Route, the Humeston and Shen., and the Omaha and St. L. railways; 19 miles N. E. of Hamburg, 40 miles S. E. of Council Bluffs (for location, see map of Iowa, ref. 7-D). It is the center of a rich agricultural region, and contains 12 churches, the Western Normal College (opened in 1881), 3 public-school buildings, 2 national banks with combined capital of \$115,000, a private bank, and a semi-weekly and 3 weekly newspapers. The vicinity includes among its industries some of the largest wholesale nurseries in the West. Pop. (1880) 1,387; (1890) 2,440; (1895) 3,100. EDITOR OF "SENTINEL."

**Shenandoah**: borough; Schuylkill co., Pa.; on the Lehigh Val., the Penn., and the Phil. and Read. railways; 18 miles N. by E. of Pottsville, the county-seat, and 105 miles N. W. of Philadelphia (for location, see map of Pennsylvania, ref. 5-H). It is in the heart of the richest coal district in the anthracite region, the development of which has given it rapid growth. Six of the largest collieries in the coal region are within the borough limits, and eight others, equally productive, are within the radius of a mile. The borough has gas and electric-light plants, an electric railway connecting adjoining towns and villages, 2 national banks with combined capital of \$200,000, 3 building and loan associations, each local and serial, and a daily and 2 weekly newspapers. There are 18 churches, 7 public-school buildings (valued at \$60,000), a public library connected with the schools, 2 parochial schools, a brewery, 2 hat and cap factories, and other industries. Shenandoah was laid out in 1862, and incorporated as a borough in 1866. Pop. (1880) 10,147; (1890) 15,944; (1895) estimated, over 17,000.

M. E. DOYLE, EDITOR OF "SUNDAY MORNING NEWS."

**Shenandoah River**: a stream which rises in Augusta co., Va., and flows N. E. 170 miles to the Potomac at Harper's Ferry, W. Va. The north fork joins the main stream at Front Royal. The Shenandoah affords great water-power. During the civil war its valley was the scene of many military operations, and was laid waste by Gen. Sheridan in 1864.

**Shen'di**: town of Nubia, on the Nile, in lat. 16° 38' N.; was a place of some commercial importance before the Mahdist revolt. Almost the entire population of the town and district perished of famine in 1889. C. C. A.

**Shenshin**, AFANASII AFANASIEVICH: poet, who has written under the name of Fet (that of his mother by a first marriage); b. in the government of Orel, Russia, Nov. 23, 1820; studied in the University of Moscow, and from 1844 to 1856 served in the army, after which he settled in the country. His first volume of verses was published in Moscow in 1840. As a writer Fet belongs to the school of pure art. His short poems, though at times lacking in warmth, are characterized by perfect form and delicate grace. He has also made excellent translations of the whole of Horace and Juvenal, Goethe's *Faust*, Shakspeare's *Julius Caesar* and *Antony and Cleopatra*, etc. A. C. COOLIDGE.

**Shensi**, shen'see' [literally, western defiles]: a province of China, bounded N. by Mongolia, E. by the Hwang-ho (which separates it from Shansi) and Honan, S. by Hupeh and Szechuen, and W. by Kansuh. Area, 67,400 sq. miles. S. of the Tsing-ling range it is mountainous and well wooded; N. of it the Loess (q. v.) formation prevails, and everything is yellow. The houses are made of yellow earth, vegetation is covered with yellow dust, and even the atmosphere is seldom free from a yellow haze. The chief rivers are the Wei (a long, shallow affluent of the Hwang-ho), which flows E. along the northern base of the Fu-niu and Tsing-ling ranges (some of whose peaks reach an elevation of 11,000 feet), and the HAN-KIANG (q. v.). Iron and coal abound, but are not much worked, except near the upper waters of the Han. Being a loess region, Northern Shensi is unfit for rice cultivation. Wheat, barley, pulse, millet, maize, ground-nuts, poppy, hemp, tobacco, and cotton are extensively grown. Wheat is the staple. Capital, Si-ngan-foo. Pop. about 8,500,000. R. L.

**Shenstone**, WILLIAM: poet; b. at the Leasowes, near Halesowen, Shropshire, England, in Nov., 1714; studied at Pembroke College, Oxford, and passed his life in retirement on his hereditary estate, writing elegies, ballads, odes, and

pastorals which had considerable popularity. The Spenserian poem entitled *The Schoolmistress* (1742), the *Pastoral Ballad* (1743), and the well-known stanzas *Written in an Inn at Henley*, are the only ones remembered. D. at the Leasowes, Feb. 11, 1763. His *Works and Letters* were collected in 3 vols., 1764-69. An edition of his *Poems*, by Gilliland, with a memoir, appeared at Edinburgh in 1854, and his *Essays on Men and Manners* were republished at London in 1868. Shenstone was also one of the best amateur landscape-gardeners of his time. Revised by H. A. BEERS.

**She'ol**: the transliterated Hebrew word, meaning a hollow place, a cave, used in the Revised Version of the Bible to denote the place of departed spirits. It therefore corresponds with Hades in classical Greek literature. In the Authorized Version it is translated by pit, grave, hell. S. M. J.

**Shepard**, CHARLES UPHAM, M. D., LL. D.: geologist; b. at Little Compton, R. I., June 29, 1804; graduated at Amherst College 1824; studied botany and mineralogy at Cambridge under Nuttall; taught those branches at Boston; was for two years assistant in the laboratory of Prof. Schuman at New Haven, and for one year lecturer at the Brewster Scientific Institute at New Haven; employed on a Government commission to investigate the methods of sugar-culture and manufacture in the Southern States 1832-33; lecturer on Natural History at Yale College 1830-47; associate of Dr. James G. Percival in the geological survey of Connecticut 1835; Professor of Chemistry and Natural History at Amherst 1845-52, and in the Medical College at Charleston, S. C., 1854-61; afterward became again Professor of Natural History at Amherst; was author of a *Treatise on Mineralogy* (1832; 3d ed. enlarged, 1855), and of a *Report on the Geology of Connecticut* (1837). D. May 1, 1886.—His son, CHARLES UPHAM SHEPARD, JR., M. D., born at New Haven, Oct. 4, 1842, graduated at Yale College 1863, and in medicine at Göttingen, Germany, 1867; became Professor of Chemistry at the Medical College of Charleston, S. C., in 1867. He wrote many papers on mineralogy, and has been active in the development of the phosphate industries of South Carolina and Florida. Revised by G. K. GILBERT.

**Shepard**, ELLIOTT FITCH, LL. D.: lawyer; b. at Jamestown, Chautauqua co., N. Y., July 25, 1833; was educated at the University of the City of New York; was admitted to the bar in 1858. During the civil war he raised the 51st New York Volunteer Regiment, which was called in his honor the Shepard Rifles. In 1876 he was prominent among the founders of the New York State Bar Association; and shortly before his death founded the American Sabbath Union. He was owner and editor of the *New York Mail and Express*. D. in New York, Mar. 24, 1893.

**Shepard**, THOMAS: clergyman; b. at Towcester, Northamptonshire, England, Nov. 5, 1607; graduated at Cambridge, 1627; became a preacher at Earle's-Colne, Essex; was silenced for nonconformity in 1630. He emigrated to Massachusetts, arriving at Boston, Oct. 3, 1635; succeeded Thomas Hooker as pastor of the church at Cambridge, Feb. 1636; was influential in founding Harvard College; published *New England's Lamentation for Old England's Errors* (London, 1645); *The Sound Believer* (1645); *The Clear Sunshine of the Gospel breaking forth upon the Indians in New England* (London, 1648; reprinted New York, 1865); *Theses Sabbaticae* (1649); and other theological works. After Hooker's death he was esteemed the most learned and skillful exponent of Puritan theology in New England. D. at Cambridge, Aug. 25, 1649. He left numerous works in MS., some of which were published in England, especially *Subjection to Christ* (1652), to which was prefixed a *Life* of Shepard by Samuel Mather and William Greenhill; *The Parable of the Ten Virgins Opened and Applied* (London, folio, 1660; new eds. 1839, Aberdeen, 1838 and 1853); and various collections of *Sermons*. He left an *Autobiography*, first printed at Cambridge (1832) for the Shepard Congregational Society. A collected edition of his *Works* appeared at Boston (3 vols., 1853), with a memoir by Rev. Horace Alger, of Cambridge. A memoir by Cotton Mather may be found in the *Magnalia Christi Americana* (best ed. Boston, 1855, 2 vols.). Revised by S. M. JACKSON.

**Shepardson College**: See DENISON UNIVERSITY.

**Shepherd-dog**: any one of the breeds of domestic dogs which are trained to assist in attending the flocks of sheep. Of all strains of shepherd-dogs the Scotch collie is the most celebrated. It is one of the most sagacious and docile of dogs. A good Scotch collie should have a long, narrow

Richmond. On the 25th he rejoined the army, having destroyed the dépôts, trains, and track at Beaver Dam and Ashland stations, liberated 400 Union men, and defeated the enemy's cavalry at Yellow Tavern, where their cavalry leader, J. E. B. Stuart, was mortally wounded. The outer line of works around Richmond was taken, but the second line was too strong to be carried. Resuming the advance, the battle of Hawes's Shop was fought May 28; Cold Harbor was occupied on the 31st, and held until the arrival of the infantry. On June 7 Sheridan, with two divisions, started around the left of Lee's army and destroyed the Virginia Central Railroad in the rear. The Richmond and Fredericksburg railroad was struck at Chesterfield, and the Virginia Central was again cut at Trevilian's, where he routed Wade Hampton (June 11); next day he tore up the railway nearly to Louisa Court-house, when, on the advance toward Gordonsville, an indecisive engagement took place; not hearing from Hunter, who was to meet him here, he withdrew, rejoining the army June 19. On Aug. 7 the Middle Department and departments of West Virginia, Washington, and Susquehanna were constituted "the Middle military division," and Sheridan assigned to command of the same. Numerous severe cavalry skirmishes occurred during August and early in September, but no general engagement, although the two armies lay in such position—the Confederates under Gen. Early on the west bank of Opequan Creek, covering Winchester, and Sheridan in front of Berryville—that either could bring on a battle at will. The imperative necessity of having the unobstructed use of the Baltimore and Ohio Railroad and the Chesapeake and Ohio Canal led Grant to take the initiative, although Sheridan's defeat would have exposed Maryland and Pennsylvania to invasion; but before giving orders to attack he visited Sheridan (Sept. 16), the latter expressing such confidence of success that Grant gave him but two words of instruction: "Go in!" Three days later, at the crossing of the Opequan, he attacked Early, whom he routed after a vigorous battle, and captured 3,000 prisoners and 5 guns. Early rallied his army at the strong position of Fisher's Hill, where, on the 22d, he was again defeated, with heavy loss, and pursued to the mountains. Sheridan devastated the valley on his return, rendering it untenable for an enemy's army. He was then (Sept. 20) appointed a brigadier-general in the regular army. On Oct. 19 Early, after surprising the Union army in the morning, was disastrously defeated, owing to the arrival of Sheridan from Winchester. (See CEDAR CREEK.) The thanks of Congress were bestowed upon Sheridan and his army, and Nov. 8 he was appointed major-general in the regular army. On Feb. 27, 1865, starting out with 10,000 cavalry, he destroyed the Virginia Central Railroad, the James River Canal, and immense quantities of supplies, and defeated Early again at Waynesboro, rejoining Grant before Petersburg Mar. 27. Sheridan had now a force of about 9,000, and in subsequent operations was under the immediate orders of Gen. Grant. He commanded at the battle of FIVE FORKS (q. v.) with his customary vigor. The loss of this battle compelled Lee to evacuate Petersburg. Sheridan pursued the flying army to Sailor's Creek, where he captured 16 guns and 400 wagons. When the Sixth Corps came up a combined attack resulted in the capture of upward of 6,000 prisoners. On Apr. 8 four supply-trains were captured at Appomattox Station, and at Appomattox Court-house the advance of Lee's army was resisted until dark. On the morning of the 9th the enemy endeavored to break through his dismounted command, but abandoned the attempt when Sheridan, moving aside, disclosed the infantry behind. Mounting his men, Sheridan was about to charge when the white flag betokening surrender was displayed in his front. In June, 1865, he was placed in command of the military division of the Southwest, of that of the Gulf in July, of the department of the Gulf, Aug., 1866, and of the fifth military district (Louisiana and Texas) Mar., 1867. In Sept., 1867, he was transferred to the department of the Missouri, continuing in command until Mar. 4, 1869, when he was promoted to be lieutenant-general, and assigned to command of the division of the Missouri, headquarters at Chicago, assuming command Mar. 16. In 1870 he visited Europe and witnessed the Franco-German war. During the political disturbances in Louisiana in 1875, Gen. Sheridan was sent to New Orleans, returning to Chicago on quiet being restored. He assumed command of the army Nov. 1, 1883; was appointed general June 1, 1888. Author of *Personal Memoirs of P. H. Sheridan* (1888). D. at Nonquitt, Mass., Aug. 5, 1888.

Revised by JAMES MERCUR.

**Sheridan, RICHARD BRINSLEY BUTLER:** dramatist; son of Thomas Sheridan, actor and author, and Frances Chamberlaine, author; b. in Dublin, Ireland, Sept., 1751; educated in Dublin and at Harrow School; published a rhymed translation of Aristænetus, Aug., 1771; married Miss Linley, a beautiful oratorio singer, of Bath, in 1773; brought out his first comedy, *The Rivals*, at Covent Garden, Jan., 1775; followed it in November with an opera, *The Duenna*, for which his father-in-law composed the music, and which was acted seventy-five nights the first season; became part-purchaser of Garrick's half of Drury Lane theater in June, 1776; produced *A Trip to Scarborough* Feb., 1777, altered from Vanbrugh's *Relapse*; and in May followed it with *The School for Scandal*, the most successful comedy of manners in the English language; became owner of one-half of Drury Lane 1778; wrote *Monody on Death of Garrick* 1779; brought out the farce of *The Critic, or a Tragedy Rehearsed*, Oct., 1779. Elected a member of The Club, he became a friend of the leading wits and statesmen of the time; was elected to Parliament from Stafford 1780; was Secretary of the Treasury 1782; cultivated oratory with great success; crowned his fame as a public speaker by two great speeches against Warren Hastings, one in bringing charges in Parliament, Feb., 1787, and one on the trial at Westminster Hall, in June of same year; held his own in debate even against Pitt; revised Thomson's adaptation from Kotzebue, *The Stranger*; rebuilt Drury Lane 1784; produced in 1799 his patriotic play, *Pizarro*, also an adaptation from Kotzebue; became treasurer of the navy and a privy counselor in 1806; was ruined by the burning of Drury Lane 1809; made his last speech in Parliament 1812. Having fallen into habits of dissipation and carelessness in money matters, his last years were harassed by the importunities of creditors, pursuing him even to his death-bed. D. July 7, 1816, and was buried in Westminster Abbey. His *Life* was written by Thomas Moore (1825), who also edited his plays, admitting one piece, *The Camp*, which he did not write. His *Speeches* have been collected in five volumes (1816). *The Rivals* and *The School for Scandal* were published in 1884, with biography, introductions, and notes, by the present writer. BRANDER MATTHEWS.

**Sheridan, THOMAS:** actor and author; b. in 1721 at Quilca, near Dublin, Ireland (the residence of Dean Swift); educated at Trinity College, Dublin; became an actor 1743; played tragedy at Covent Garden theater 1744 and at Drury Lane 1745; was by some considered a rival of Garrick; was manager of the Dublin theater 1746-55; was ruined by a wanton riot; withdrew temporarily from the stage; became a successful teacher of elocution at London, Oxford, and Cambridge, and in Scotland and Ireland; returned to the stage 1760; was pensioned by George III.; was acting manager of Drury Lane 1776-79, after his son obtained control of that theater; published several works on elocution; edited the works of Swift (1784); wrote his *Life*, and was author of a *General Dictionary of the English Language* (1780) of considerable phonetic value. D. at Margate, England, Aug. 14, 1788. Revised by BRANDER MATTHEWS.

**Sherif, she-reef** [Arab. *sherif*, noble]: a title; applied by Mussulmans to descendants of Fatima, the daughter of the prophet Mohammed. The Sherif of Mecca is the guardian of the KAABA (q. v.), and chief dignitary of the city. E. A. G.

**Sheriff** [M. Eng. *shereve* < O. Eng. *scir-gerefa*; *scir*, shire + *gerefa*, reeve, officer]: a county officer with administrative and generally also judicial functions.

In England, Ireland, and Wales the sheriff is the chief officer of the crown, in every county or shire, who does all the sovereign's business in the county, the custody of the county being committed to him alone by letters patent of the crown. The office of sheriff is one of the most ancient and honorable known to the English law. The custody of the county is said to have formerly been committed to the earl or (Lat.) *comes*, and anciently the sheriff, whose Latin title is *vicecomes*, was his deputy. The earls in time became unable to transact the business of the county, and the burden was laid on the sheriff, who is now entirely independent of the earl.

Sheriffs were formerly chosen by the inhabitants of the several counties, but now by statute they are annually appointed by the crown (on nomination by the judges and the great officers of the crown) on Nov. 12, and the person appointed must have sufficient land within his county or bailiwick to answer the crown or the people. The discharge of the office is compulsory, and within one month after a

[illegible]

As the Keeper of the King's peace he is the first man in the nation, and appears in order to any turbulent element during the most critical of all. He may apprehend and arrest any man who breaks the peace, or attempts to break the peace, he may detain any one in a cage to keep the peace, he is ordered to punish all traitors, murderers, and other criminals, and commit them to jail. He is also to defend the country against any of the King's enemies, and for this purpose, as well as for the purpose of keeping the peace, or apprehending traitors, he may command all the people to assemble to attend him. See Prince Alexander's

The second, an inferior officer of court, is also bound to execute commands issuing from the high court of justice, and to attend to the judgment when they come into the court of the inferior. It is not, however, his duty to serve all processes by which the court may be brought, without he has a party taking service, or to comply, for the courtesy he owes, upon a proper order, with a writ taken severally from the defendant to force the defendant to satisfy his grant; he executes commands issued by the court without making any; and in any action or cause by law and custom he comes to trial, champion and defend the cause, when the case is determined he must see the judgment and sentence of the court carried into execution, because therefore he is liable like other inferior officers, to be removed for the negligence or improper discharge of his duty. To persevere himself against liability for mistake he may, however, at death, escape from the proper party a bond to satisfy it.

When entering a rural process, the sheriff may break open a window door or shut door, or other building, but a process may not force an entrance into a house, although when once admitted he may break through a door, and he may break the outer door of build- ings, and other dwellings. It is about the sheriff's business to be careful to preserve the rights of the crown within his jurisdiction, as is to be seen in his writs, his taskbook, and in the celebrated books, laws, and constitutions, and in the statute books, etc.

Although the sheriff's authority extends in general over every county there are many liberties exempt from his jurisdiction in which he cannot crown grants, the execution of legal process, etc., is bestowed upon other persons. These liberties though still designated, are now partly subject to the supervision and control of the sheriff.

the sheriff, for the better execution of the duties imposed upon him, has under him many inferior officers—an under-sheriff, a deputy, and bailiffs; and these under-officers may, in some cases, give these officers an embargo of 450*l.* and the sheriff himself is forbidden to "not to form" his party for any part of it. The under-sheriff, deputy, and bailiffs of the sheriff are, in all respects his agents, and any persons or law officers who act which are purely administrative in their nature, and not any which are judicial. Their duty, with respect to, he is responsible for all their defaults done in the name of office, every when willful, and intentional, or in violation of law. To prevent himself he may appoint them bonds with securities for their good behavior. The under-sheriff is the chief local judge of the county. His jurisdiction in civil matters extends to all persons, and is not limited by bond, or obligation, to the sheriff, or to his parties, but real, or personal nature, and quantity. All civil matters not especially committed to some other officer, has original jurisdiction in general, except in cases of a lease, which do not himself as a parish, or a lease of land from Scotland, and he may thus receive them from the county, and generally even the civil jurisdiction of these a term.

... called the "S. S. the Chief" in the chief of...

intensive character of such society, and his personal desires and passions are essentially the same as to England. In many respects pertaining to the external and external world of the law, whether they are concerned. He is not, however, the administrative life of any of all the suffering countries, setting a firm, but only, aligned with the time of suffering, after that their passions and desires. He is, however, a member of all, and his law is not based on the principles of the executive branch of the U. S. Government. He is generally elected by popular vote for a fixed term, usually three years, but in a few States the electoral process is appointed by the Governor or will be elected. Of his common-law political functions the only one retained is the execution of laws by the aid of a jury to certain classes of cases in which defendants have much to gain.

For a full statement of the subject, see the details of the proceedings in questions and answers in numerous copies of *London England*, a pamphlet and tract I sent the *Rev. and Duties of Sheriff of Scotland*, (1876), *Esquay's Manuscript of the Law of Scotland*; *Miller's History of Scotland*; *Bell's Dictionary of the Law of Scotland*; *Black's Institutions for Sheriff, Clerks, and Constables Clergy*, (1874), and *Crosby's Duties of Sheriff, Clerks, and Constables* (ed. of New York, 1918).

**Sherrinck, Thomas, D. D.**: bishop and author, son of Dean William Sherrinck; born in London, England, in 1678; educated at Eton; graduated at Cambridge 1696; was master of the Temple for many years, 1704 and was made a prebendary of London 1715, vice-chancellor of Cambridge 1714, dean of Christchurch Nov. 1715, prebendary of Norwich 1719, Bishop of Bangor Feb. 4, 1729, of Rochester 1734, and of London 1749, being elected in 1747 the Archbishop of Canterbury. He took an active part in the Heterodox movement in supporting to Dr. Hoadly (1726), wrote several controversial works on Christian theology, of which the most celebrated were *The Use and Abuse of Prophecy* (1726) and *Trial of the Witnesses of the Resurrection of Jesus* (1729), and published four volumes of his *Discourses at the Temple Church* (1754-55), which gained him a high reputation as a pulpit orator. D. in London, July 18, 1766. His works were edited by T. S. Hughes, D. D., London, 5 vols. 1830.

**Sherlock, William, D. D.**—clergyman and author; b. in Southwark, London, England, 1641; educated at Eton; graduated at Cambridge 1660; took orders in the Church of England; became pastor of St. George's, Southwark Lane, London 1682, parson of St. Paul's 1684, minister of the Temple 1684, and Dean of St. Paul's 1691, in which year he at first refused to take the oaths of allegiance to William and Mary, but subsequently took them; published a pamphlet in justification of his course, *The Case of Allegiance due to Sovereign Powers Stated* (London, 1691), which caused a great sensation and elicited many replies. D. at Hantsport, June 19, 1707. Author of over sixty publications, chiefly theological and controversial, of which the *Vindication of the Doctrine of the Trinity* (1686) directed against Dr. South, and the *Practical Discourse concerning Death* (1689; 2d ed. 1785) made a great impression at the time, but are now little read. Other works are *The Judgment* (1692) and on *The Divine Providence* (1694; edited by T. D. Summers, Nashville, Tenn. 1863; 3d ed. 1875).

**Sherman:** city, capital of Garza co., Tex., on the Hous. and Tex. Cent. the Mo., Kew. and Tex., the St. L. S. W., and the Tex. and Pac. railways; 10 miles S. of the Red river, and 67 miles N. of Dallas (for location, see map of Texas, vol. 2-1). It is a wheat, corn, cotton, and fruit region, and within 50 miles of the great Ardmore coal-fields, and has large manufacturing and shipping interests. It contains one of the largest concentrated mills in the South, a cotton-gin (cost about \$250,000), and said to be the largest in the world; several flour, saw, and planing mills; foundries and machine-shops, marble works, cigar, furniture, carriage, harness, and mattress factories, and brick-yards. There are 7 churches, American College for boys (Presbyterian, St. Joseph's Academy (Roman Catholic), St. Anna Institute, the North Texas Female College, a commercial college, improved water-works, electric street lights and railway, a national bank with capital of \$500,000, a State Bank with capital of \$200,000, and 2 daily and 3 weekly newspapers. The city lies on altitude of about 1,000 feet above sea-level. Pop. (1880) 6,613; (1890) 7,285.

Sherman, CHAS. DUNSTON; poet; b. at Pack-Kill N. Y.  
May 6, 1861. He was educated at Columbia College and

Harvard University; became a fellow of Columbia in 1887, and afterward instructor in the Columbia School of Architecture. He has published *Madrigals and Catches* (1887); *Lyrics for a Lute* (1890); and, with John K. Bangs, *New Waggings of Old Tales* (1888).

**Sherman, JOHN:** clergyman; grandson of Roger Sherman; b. at New Haven, Conn., in 1772; graduated at Yale College 1792; was pastor of the First Congregational church at Mansfield, Conn., from Nov., 1797, to Oct., 1805, when he left that post on account of having adopted Unitarian principles; was for a short time pastor of a Unitarian church at Trenton Falls, N. Y., where he established and conducted an academy. D. at that place Aug. 2, 1828. He was the author of *One God in One Person Only* (1805), the first elaborate defense of Unitarianism that appeared in New England; and *Philosophy of Language Illustrated* (1826).

Revised by G. P. FISHER.

**Sherman, JOHN:** statesman; b. at Lancaster, O., May 10, 1823; brother of Gen. W. T. Sherman; was admitted to the bar 1844; was a delegate to the Whig conventions of 1844 and 1848; sat in Congress 1855-61; was Republican candidate for the Speakership 1859, but was defeated after a prolonged contest; became chairman of the House committee of ways and means; was re-elected to Congress 1860, but before taking his seat was chosen U. S. Senator; re-elected 1866 and 1872; was long the chairman of the Senate committees on finance and on agriculture; took a prominent part in debates upon finance and the conduct of the war, was one of the authors of the reconstruction measures adopted 1866-67, and was appointed Secretary of Treasury Mar. 7, 1877. He was elected U. S. Senator from Ohio Jan. 18, 1881; elected president *pro tem.* of U. S. Senate Dec. 7, 1885; re-elected U. S. Senator Jan. 13, 1886, continuing president *pro tem.* of the Senate, but he resigned the latter office Feb., 1887. In 1888 he was a prominent candidate for the presidential nomination, which was finally awarded to Harrison. He was re-elected to the Senate in 1893.

**Sherman, ROGER, M. A.:** signer of the Declaration of Independence; b. at Newton, Mass., Apr. 19, 1721; was in childhood apprenticed to a shoemaker, and followed that occupation until 1743, when he settled at New Milford, Conn., and joined an elder brother in keeping a small store; studied privately law, politics, and mathematics; was chosen county surveyor 1745; made for several years the astronomical calculations for an almanac issued in New York; studied law; was admitted to the bar 1754; sat for several years in the colonial assembly; removed to New Haven in 1761; was assistant governor nineteen years (1766-85), judge of common pleas and of the superior court twenty-three years; treasurer of Yale College 1766-76; sat in Congress from 1774 until his death; was one of the five members of the committee to draft the Declaration of Independence 1776; served on many important committees on the board of war and ordinance and on the treasury board; assisted in codifying the laws of Connecticut 1783; was one of the framers of the original Articles of Confederation 1777, and an active member of the Federal constitutional convention 1787; U. S. Senator 1791-93; and mayor of New Haven from 1784 till his death in that city July 23, 1793.

**Sherman, THOMAS WEST:** soldier; b. at Newport, R. I., Mar. 26, 1813; graduated at the U. S. Military Academy July, 1836, when he was assigned to the artillery as second lieutenant and sent to Florida, where he served against the Indians until 1842; was subsequently employed in recruiting and in garrison until 1846; was promoted captain in May, 1846. In the war with Mexico he commanded his battery at Buena Vista, and was breveted major; again in garrison and on frontier duty 1848-61, in April of which latter year he attained a majority in his corps, and was assigned to guard the Philadelphia and Baltimore Railroad and to restore communications with Washington. On May 14 he was promoted to be lieutenant-colonel, and three days later appointed brigadier-general of volunteers. In the Port Royal expedition (Oct., 1861) he commanded the land-forces, which he had organized, continuing in command in South Carolina until the end of Mar., 1862, when he was assigned to the Army of the Tennessee as division commander, participating in the Corinth campaign (April to June). Transferred to the department of the Gulf, he commanded a division in the vicinity of New Orleans until May, 1863, when he joined the expedition to Port Hudson, and in the investment of the place commanded the second division Nineteenth Corps, forming the left wing of the besieging army.

In the assault of May 27 he lost a leg while leading the assaulting column. Colonel of artillery June 1, 1863. Returning to duty in Feb., 1864, he held various commands in Louisiana until 1866, when he was mustered out of the volunteer service. He was breveted brigadier-general and major-general for gallantry, and Dec. 31, 1870, was retired from active service with the full rank of major-general. D. at Newport, R. I., Mar. 16, 1879. Revised by JAMES MERCEUR.

**Sherman, WILLIAM TECUMSEH, LL. D.:** soldier; b. at Lancaster, O., Feb. 8, 1820; son of Judge Charles R. Sherman. From 1829, when his father died, he was reared in the family of the Hon. Thomas Ewing; in July, 1836, he was appointed a cadet at the U. S. Military Academy, and in July, 1840, he graduated and was appointed a second lieutenant in the Third Artillery; first lieutenant Nov., 1841. He served in Florida until 1842; was in garrison at Fort Mifflin, S. C.; in 1846 he was ordered to California, serving as acting assistant adjutant-general of the department of California until Feb., 1849, when he was transferred to San Francisco on similar duty on the staff of Gen. Persifor F. Smith, commanding the division of the Pacific. Ordered to New York in Jan., 1850, as bearer of dispatches, he was married on May 1 to Ellen, daughter of Thomas Ewing, then Secretary of the Interior. In September of that year he was transferred to the commissary department, with the rank of captain, and stationed at St. Louis and New Orleans until Mar., 1853, when, after a six months' leave of absence, he resigned from the army Sept. 6, 1853, to engage in the banking business in San Francisco; removed to New York in 1857, in which year the affairs of his firm were closed. In 1858 he removed to Leavenworth, Kan., where he practiced law until July, 1859, when he was elected superintendent of the proposed military academy in Louisiana. The institution was opened Jan. 1, 1860, as the Louisiana State Seminary of Learning and Military Academy, and Sherman remained at its head until Jan. 18, 1861, when he addressed a letter to the Governor asking to be relieved "the moment the State determined to secede." His request was soon after granted, and in the latter part of February he left for St. Louis, where for a short period he held the presidency of a street-railway. On May 14, 1861, he was appointed colonel of the Thirteenth Regular Infantry, and soon after his arrival in Washington was placed in command of a brigade in Tyler's division, which he led at the battle of Bull Run, July 21. On Aug. 3 his commission of brigadier-general of volunteers was issued, to date from May 17, and Aug. 24 he was ordered to duty in the department of the Cumberland under Gen. Anderson, succeeding to the command of that department Oct. 8, 1861, but was relieved in November and sent to Missouri. After a brief service on inspection duty he was (Dec. 23) placed in command of the camp of instruction and post of Benton Barracks, whence in Feb., 1862, he was transferred to Paducah, Ky., to aid in the operations then in progress on the Tennessee river. Here he organized the division which he subsequently commanded at the battle of Shiloh (Apr. 6-7), where his conduct did much to check disorder and overcome the shock of the unexpected onset. Gen. Halleck reported that Sherman's firmness at the 6th saved the day. Grant officially announced that he was indebted to Gen. Sherman for the success of the battle. The advance upon and siege of Corinth next followed, resulting in the evacuation of that place May 29. In the meanwhile (May 1) he had been promoted to be major-general of volunteers. In July, having been assigned to command the district of Memphis, he occupied that place of the 21st, where he remained until called upon in December by Gen. Grant to take command of the expedition for the capture of Vicksburg. As this movement was intended to be a surprise, the preparations were hastily executed. Embarking his troops Dec. 21, a landing was effected on the 26th at Johnston's Landing, some 12 miles up the Yazoo. On the 29th the attempt to carry the position by assault was bravely made, but without success, and, owing to the surrender of Holly Springs, which overthrew Gen. Grant's plan of co-operation, re-enforcements were arriving to the aid. Sherman returned to Milliken's Bend, where Gen. McPherson took command Jan. 4, 1863. Sherman was assigned to the Fifteenth Corps, which took a leading part in the assault and capture of Arkansas Post (Fort Hindman) on the 11th.

In the Vicksburg campaign which succeeded, Sherman bore a prominent part with his command—in the expedition to Steele's Bayou to the Yazoo (March); the feint upon Haines'

**Sherwood Forest:** a hilly region in the west of Nottinghamshire, England, between Nottingham and Worksop, about 25 miles in length by 8 in breadth. It was once a royal hunting-forest, and known to legend as the scene of Robin Hood's exploits. It is divided into farms, and it includes the town of Mansfield, several villages, and many parks and gentlemen's country-seats. The soil is gravelly and usually unproductive.

**Shetland (or Zetland) Islands:** a group of about 100 islands, of which 23 are inhabited, in the Atlantic Ocean between lat. 59° 50' and 60° 52' N., and belonging to Scotland. Area, 551 sq. miles. Pop. (1891) 28,711. The largest island is Mainland, with the town of Lerwick; among the others are Yell, Unst, Barra, and Foula. They are all treeless, high, and rocky, presenting steep, abrupt, and bold coasts, with fine natural harbors, and a rugged, wild surface in the interior. In the valleys some oats, barley, and potatoes are cultivated. The climate is mild and damp. Many cattle and sheep are reared, but the principal occupation of the inhabitants is fishing, especially for cod and herrings, giving employment to 7,500 men and 300 boats. Eggs form an important article of export. See Hibbert, *A Description of the Shetland Islands* (new ed. 1892).

**Shevchen'ko, TARAS GRIGOROVICH:** the greatest of Little Russian writers; b. Feb. 25, 1814. He was the son of the serf of a German landed proprietor in the government of Kiev, and from his childhood was exposed to brutal treatment, but picked up the rudiments of an education, early showing a talent for song and also for painting, which caused him to be apprenticed to a house-decorator in order to learn that business. In 1832, with his master, he moved to St. Petersburg, where he attracted the interest of the poet Zhukovskii and others, who bought his freedom. At first all went well with him, but in 1847, owing to some of his writings and to his participation with KOSTOMAROV (*q. v.*) in a society of which the Government disapproved, he was banished as a common soldier to the Asiatic frontier of the empire. In this vicinity he passed the next ten years, part of the time in prison and forbidden to write or paint. After the accession of Alexander II., the intercession of powerful friends procured his pardon, but although he began to compose again his health was broken and he died in St. Petersburg, Feb. 26, 1861. Shevchenko's *Kobzar*, a volume of lyrics in the Little Russian dialect, appeared in 1840 (new ed. 1860), and achieved great popularity. The deep poetic sympathy for the life of the people in these pieces made their author the idol of his countrymen, while the hopeless sadness and pessimism of his tone were the natural result of his own experiences. In 1841 he brought out *Haidamaki*, a Cossack epic, also the only Russian one with claims to greatness, and this was followed by *Hamalia, Maiak*, and other pieces. See article in the *Revue des Deux Mondes* (1874), and *The Peasant Poets of Russia*, by W. K. Morfill, in *The Westminster Review* (July, 1880). A. C. COOLIDGE.

**Shibboleth** [from Heb. *shibboleth*, ear of corn, stream, deriv. of \**shābhal*, increase, flow]: a test or password by which one's rank in society is indicated. It is recorded in Judges xii. that after Jephthah's victory over the Ephraimites the men of Gilead detected their fugitive enemies by requiring them to pronounce the word *shibboleth*, which the Ephraimites called *sibboleth*, and thus betrayed their origin; whereupon they were put to death.

**Shield** [O. Eng. *scield*: O. H. Germ. *scilt* (> Mod. Germ. *schild*): Icel. *skjöldr*: Goth. *skildus*]: a buckler, a broad defensive weapon carried upon the arm to protect the body from blows and missiles. Most savage nations employ shields of some form, and all the nations of antiquity used them, as in mediæval Europe, down to the general introduction of gunpowder in warfare. The shield is of great importance in heraldry. For practical use, shields were of leather, wood, basketwork, etc. See HERALDEY.

**Shieldrake:** See SHELDRAKE.

**Shields:** the name of two towns of England, about 8 miles from Newcastle, opposite to each other on the Tyne, near its entrance into the North Sea—North Shields on the northern bank, in the county of Northumberland; South Shields on the southern, in the county of Durham (see map of England, ref. 4-1). North Shields has two docks—the Northumberland, of 55 acres, opened 1857, and the Albert Edward, of 24 acres, opened 1884. There are large exports of coal and coke and imports of timber, grain and esparto-grass. North Shields forms part of the borough of TYNE-

MOUTH (*q. v.*). The total tonnage entered and cleared at both ports, exclusive of that coastwise, was, in 1893, 3,540,869. South Shields is an old town, but is well built in its modern part. It has a town-hall, public library and museum, marine school, etc., and a park of 45 acres. The south pier, a breakwater nearly a mile in length, was begun in 1854, and is not yet completed (1895). The Tyne docks of the North Eastern Railway, covering 50 acres, are chiefly used for shipping coal and coke. The harbor is lined with ship and boat yards, and alkali, glass, and iron works. On an eminence overlooking the harbor are the remains of a Roman station where coins, portions of an altar, etc., have been dug up. South Shields sends one member to Parliament. Pop. (1891) 78,431. R. A. ROBERTS.

**Shields, CHARLES WOODRUFF, D. D., LL. D.:** educator; b. at New Albany, Ind., Apr. 4, 1825; graduated at Princeton College (1844) and Theological Seminary (1847); was pastor of Presbyterian churches at Hempstead, Long Island, 1849-50, Philadelphia, 1850-65; and since 1865 has been Professor of the Harmony of Science and Revealed Religion in Princeton College. He has published *The Presbyterian Book of Common Prayer according to the Revision of the Westminster Divines* (New York, 1864; 4th ed. 1886), *Liturgia Expurgata* (Philadelphia, 1864; 3d ed. New York, 1884); *Philosophia Ultima, or Science of the Sciences* (vol. i., New York, 1877; 3d ed. 1889; vol. ii. 1889); *Order of the Sciences* (1884); *Religion and Science in their Relations to Philosophy*; *Essays on Church Unity* (1891); *The Historical Episcopate* (1894); and *The Question of Unity* (1894). C. K. HOYT.

**Shi-Hwang-Ti:** See CHI-HWANG-TI.

**Shi'tes** [Arab. *shiah*, sect]: the most numerous of Musulman heretical sects. Their main characteristics are rejection of the Sunna (see SUNNITES) and extravagant devotion to Ali, the son-in-law of the prophet Mohammed and the fourth caliph. The most advanced maintain that the revelation of the Koran was intended by God for Ali, but given to Mohammed through an error of the archangel Gabriel. The majority, however, are content with denouncing the first three caliphs, Abubekir, Omar, and Othman, as usurpers, and asserting that Ali was the rightful successor of Mohammed. The memory of the tragic death of Ali by murder, and of his two sons, Hassan and Houssein, by poison and murder, inflames the Shi'tes to this day beyond conception and is annually commemorated with bloody rites. The bitterness of hatred between the Sunnites and Shi'tes has never been equaled even in the most envenomed wars of Christendom. To kill one Shi'te is declared by the Sunnites more acceptable in the sight of God than the slaughter of seventy Christians. In the treaties imposed by the Ottomans on Persia the first clause has commonly stipulated that the Persians who are Shi'tes, should not hereafter curse the memories of the first three caliphs. The Shi'tes are found mainly in Persia, India, and among the Tartars. They number probably not more than 18,000,000, and are divided into many minor and hostile sects. E. A. GROSVENOR.

**Shikarpur:** town: in the Presidency of Bombay, British India; in a low, level, regularly inundated, but fertile and not unhealthful plain; in lat. 27° 57' N., lon. 68° 45' E.; 15 miles W. of the Indus, with which it communicates by a canal (see map of N. India, ref. 5-A). It is an entrepôt for transit trade between the Bolan Pass and Karachi. Pop. (1891) 42,004.

**Shiko'ku:** the third in importance of the islands forming the empire of Japan: between lon. 132° and 135° E. and lat. 32½° and 34½° N.; area, 6,855 sq. miles. The mean temperature is about 59° F. The island comprises the provinces of Tosa, Awa, Sanuki, and Iyo. The surface is hilly, and there is no mountain over 4,600 feet high. The chief towns are Kochi, Matsuyama, Takamatsu, and Tokushima. Pop. (1891) 2,827,397. J. M. P.

**Shill'aber, BENJAMIN PENHALLOW:** humorist; b. in Portsmouth, N. H., July 12, 1814; entered a printing-office at Dover 1830; was a compositor at Demerara, Guiana, 1835-37, and in the office of *The Boston Post* 1840-47; was editorially connected with the latter paper 1847-50, acquiring celebrity by his "sayings of Mrs. Partington"; was printer and editor of *The Pathfinder* 1850-52; proprietor and editor with Charles G. Halpine ("Miles O'Reilly") of *The Clubbag* 1850-52; returned to the *Post* 1853-56, and was one of the editors of *The Saturday Evening Gazette* 1856-66; retired to his home at Chelsea, Mass., and devoted himself to

which are regarded as of great value. He was elected president of the American Institute of Mining Engineers in 1880, and president of the American Society of Civil Engineers in 1890. D. at Homewood, Pa., May 5, 1892.

**Shinshiu, or True Doctrine** (known also as *Ikko- or Monto-shiu*): a powerful sect of Japanese Buddhists, having their headquarters at Kioto, in the great *Nishi* (West) *Hongwanji* temple. Its founder was a man of good family, Shinran Shonin (1173-1262 A. D.), who studied as a lad at Hiyeizan. (See Kioto.) The Shinshiu sect finds salvation in the "extinction of passion," a doctrine at once the cause and effect of salvation, which salvation is called Nirvana. The doctrine of "help from another" is also taught, and Amita, or "the boundless" Buddha, is relied upon for the completion of merits and a rebirth into paradise. In this sect there is less difference than in any other between laymen and priests, the latter being allowed to marry and to eat flesh and fish.

J. M. DIXON.

**Shinto** (liter., Way of the Gods): the ancient cult of the Japanese, which has scarcely a title to be classed among religions, having no moral system and no eschatology. It has passed through three phases: the early stage, when it was part and parcel of the national life, and was as much political as religious; the second stage, when it had to struggle with the powerful and profound system of Buddhism, which almost swallowed it entire; and the modern stage, when a brilliant band of literary men sought to rescue it from the obscure condition into which it had fallen. These strove to identify it with a reformed patriotism and a restored imperialism, and their views finally triumphed in the restoration of 1868. The first period may be considered to have lasted until about A. D. 550, and its history is told in the *Kojiki* and the *Nihongi*, written a century and a half later—books which may be called the Japanese scriptures, in so far as they are concerned with the creation of the race and its early history from a religious standpoint.

Probably about the year 400 A. D. the ancestral worship out of which Shinto developed was so far organized that the home was no longer deemed sufficient, and a separate temple was erected. Over it was placed as custodian, or chief priestess, a daughter of the Mikado. When Buddhism arrived from the West in the sixth century it seems to have adopted wholesale the Shinto pantheon, and all that remained distinctive of the old ritual was the *gohei*. From this era is to be dated the term *Shinto*, way of the gods, in contrast with *Butsudo*, or way of Buddha, both Chinese terms. The *gohei* (liter., august cloth or present) was originally a piece of hempen cloth hung on the sacred *sakaki* (*Cleyera Japonica*) in honor of the gods. The material was changed successively to cotton, silk, and finally to paper. In modern temples all that is visible to the eye of the worshiper is a mirror and a bundle of these zigzag paper-cuttings attached to a rod. The paper is usually white, but on occasion a succession of *gohei* may be seen—yellow, red, black, white, blue—in honor of the gods of wood, fire, earth, water, and metal respectively. The wand plays a considerable part in the divination with which Shinto became associated during the thousand and odd years of its eclipse. The god was supposed to come in answer to the worshiper's call and to possess the wand, and through it the *gohei*, the whole rite resembling closely the Shamanism of Northern Asia. The priests of Shinto seem to have made clever use of the phenomena of water boiling on mountain heights at a low temperature, and of the heat-absorbing qualities of salt, in their ordeals of water and fire. See *Esoteric Shinto*, by Percival Lowell, in vols. xxi.-xxii. of the *Transactions of the Asiatic Society of Japan*.

The Tokugawa shogunate strongly favored Buddhism, with its gorgeous ritual and magnificent temples; but a reaction toward the simplicity of early Japanese life and customs set in among native scholars, Mabuchi (1697-1769), Motoori (1730-1801), Hirata (1776-1843) being the most prominent. This movement is known as the revival of pure Shinto, and was directly hostile to the dual rule under the shogunate. Satsuma, always less Buddhist than the rest of Japan, led the restoration movement in 1868, and the result was altogether favorable to Shinto, which became the only state religion. Buddhist temples were stripped, "purified," and handed over to Shinto keeping. The revived religion, however, proved entirely too feeble to supplant Buddhism and quickly lost ground. "Pure Shinto," indeed, was largely the fad of scholars, for Buddhism had appropriated and assimilated almost everything that was dear to the people in their old religion.

The Shinto temple proper (*yashiro* or *jinja*) differs from the Buddhist *tera* (monastery or temple) in being that a destitute of furniture, smaller, and usually double. The inner shrine (*honsa*) at the back contains, carefully inclosed in a succession of boxes, the sword (if a male deity), or mirror (if a female), which is jealously guarded as the sacred treasure of the place. With this mirror the mirror exposed to view in the outer shrine or oratory (*haiden*) has nothing whatever to do, being a loan from Buddhism. Worshippers ascend the steps in front, strike the temple-gong with a mallet provided for the purpose, smite or rub their hands together, and then depart after throwing some coins on the floor. The entrance to the temple is a torii, or sacred arch. Shinto morality is practically a Rousseau-like following of natural impulses, and proclaims neither heaven nor hell; its priesthood is not a caste, nor wholly devoted to a religious life; it is largely a form of hero-worship, and intensely national; and its chief deity is Amaterasu, goddess of the sun, from whom the Mikado traces his descent.

Other deities are Susano, a kind of Mars, presiding over the moon; and his daughter Uga-no-mitama, popularly worshipped as Inari, the goddess of rice. Most of the deities appear to be deified human beings. See article on Inari for Japanese mythology, the *Introduction to the Kojiki*, *Transactions of the Asiatic Society of Japan* (vol. x.), and various articles in these *Transactions* by Ernest Satomura. J. M. DIXON.

**Ship-building**: naval architecture, or the art of designing and constructing vessels for navigation, and more particularly the larger vessels, or those which carry men, whether intended for war or for commercial purposes. It is impossible to state with any degree of accuracy the portion of the globe in which ship-building originated. Among razor-knives found in Denmark, belonging to the "bronze age" in Europe, are several with representations thereon of galleys which compare favorably with those of ancient Rome. The Phœnicians were the greatest commercial people of ancient history, and, instructed by the Egyptians, seem to have been the first to make material progress in the construction of vessels. Among the paintings in the tomb of Rameses the Great is a representation of a naval combat between the Egyptians and a people supposed to be Phœnicians, whose ships are propelled by sails. A biblical reference to the power of Tyre, capital of Phœnicia, describes its vessels and their construction: the planking being made of the fir-trees of Senir (Hermont), the masts of cedars of Lebanon, the oars of the oaks of Bashan, the rowing-benches of ivory, and the sails of fine linen of Egypt. Reference is also made to mariners, pilots, captains, and men of war, showing the progress made in the arts of ship-building and navigation. A peculiar feature in the construction of the ships of the Egyptians was the planking, which was about 3 feet square, and was laid overlapping, like shingles upon a roof, being fastened to the ribs or frames by wooden tree-nails. According to Herodotus the Nile vessels were fitted with rudders at the stern, thus antedating the application of that invention to sailing vessels by several centuries. The vessels of the Phœnicians served as models to the Greeks, whose ships of the height of their civilization, show a marked resemblance to those of the dwellers in Tyre.

**Ship-building in Europe.**—The nations of the north of Europe developed a class of vessels which, from specimens found buried in mounds in Scandinavia and Denmark, show a remarkable knowledge of the forms of least resistance, together with the strength of materials and their proper distribution, and suggest that the influence of the Phœnician ship-builders had in some way penetrated to the north of Europe.

Cæsar, in his history of the campaign against the Veneti in the year 54 B. C., states that their ships were built of tire of oak, and designed to endure the force and violence of the tempests; the rowers' benches were fastened by iron spikes; instead of cables, they secured their anchors with chains of iron. A Roman ship of the time of Trajan, sunk in Lake Ricciola, was raised after more than 1,300 years. The planking was of pine and cypress, covered on the outer side with sheets of lead fastened with copper nails.

The Greeks and Romans had a peculiar method of girding their vessels with long hempen cables, which, passing through holes at the stern-post, continued all around the vessel fore and aft immediately under the wales; as the hulls were undergirded transversely in the same manner

[illegible][illegible]

The same success has also been the art of ship building where the same concentrated results. "The old proportions were well suited to the speed of sailing ships and a complete set of six things were all adapted for practical seaward comfort and still more so for propulsion." The steam navy today and for propelling power has been altered at its most active stage, as a result of which it has completely lost the way.

[illegible]

in the difficulty of obtaining the necessary strength of material for gut-wirety ships have been confined to the expense of their advantages are the most serious and have been exaggerated and exaggerated from the fact that before this water they may be exposed to the sea. It is by a small hole above the bottom of the ship and under the gunwale thus making them to resist a long time without flooding. The the other side of the bottom of the material of which they are made is made of a material which is not necessary.

[illegible]

the buoyancy of the water acting in an opposite direction through a point which is the center of gravity of the volume of displacement, called the center of buoyancy. When the vessel is at rest in an upright position the two points lie in the same vertical plane. The position of the center of buoyancy is calculated about two axes—one taken at the load-line and the other at the mid-length of the vessel. In order that the vessel may float at a given draught at the bow and stern, the center of gravity of the vessel in a fore-and-aft direction must lie in the same vertical line with the center of buoyancy of the immersed body. When these points are thus located the vessel is said to be in trim and proves the correctness of the designer's calculations, for in order to ascertain with accuracy the position of the center of gravity of the vessel the weight of each particle that goes to make up the entire vessel must not only be calculated, but also its moment about some point in the length taken as an axis. In a similar manner, the vertical center of gravity must be determined in order to ascertain its distance, called the metacentric height, below the metacenter of the vessel. The metacenter is a point above the vertical center of buoyancy at a distance equal to the moment of inertia of the load-water plane divided by the volume of water displaced. The metacentric height is a measure of the initial stability of the vessel, but not of the range of stability. (See *HYDROSTATICS, Stability of Floating Bodies*.) For good easy behavior the metacentric height should not exceed 3 feet, and for safety not be less than 18 inches, provided that the vessel has a reasonable amount of free-board or height out of water. There are many other calculations that can be made in regard to the stability of the vessel in various conditions of load or when some of the compartments are filled with water.

The plans necessary to give a clear idea of the design are given below, but these must be supplemented by detail plans of the principal parts of the vessel: 1. Plan of lines, or half-breadth and body plan. 2. Midship section. 3. Profile in-board. 4. Deck plans. 5. Cross-sections. 6. Sail plan.

The plan of lines shows the form of the vessel, and is in reality the "traces" of planes taken at right angles to each other throughout the ship. From these the shape of the vessel is laid down full size upon the mould-loft floor. The midship section is taken at the mid-length of the vessel and shows the character of the framing, the disposition and thickness of the plating of sides and bottom, decks, bulkheads, stringers, etc., in fact, all the parts upon which the strength of the vessel depends. If the vessel is not built according to the rules of one of the insurance companies, plans and calculations showing the strength of the structure must accompany the application, and this involves considerable mathematical investigation, for the ship must be taken as a girder, and the maximum stresses the material is subject to calculated for the top and bottom flanges of the girder. The inboard profile gives the location of the principal weights in a fore-and-aft direction, the spacing of the frames, the location of bulkheads, the distances between the decks, the position of cargo hatches, and the portions devoted to cargo, coal, passengers, crew, etc. The deck plans and cross-sections show the general arrangement of the deck framing and plating, and the arrangement of the cabins and passenger accommodations. The sail plan gives the general outside appearance of the vessel, with the amount of sail carried, the height of masts, etc. The many questions of handling cargo quickly and effectively, of steering-gear for controlling the vessel, providing sufficient sail-power to prevent the vessel falling off in the trough of the sea when the machinery is disabled, the working and stowing of lifeboats, give the designer occasion for the careful application of scientific and experimental data. The work involved in the preparation of the design for a war-vessel is of a much more complex nature. The features of speed, armament, protection, accommodation, and endurance are so thoroughly interwoven and depend so much one upon the other that the emphasizing of any one feature must be at the expense of some of the others. Thus the most thorough and scientific investigation must be made of the vessel in all its features to enable the maximum of efficiency to be attained in the ship as a whole.

**Laying Down.**—The form of the vessel or the lines having been determined in the draughting-room, the frames or ribs are next drawn full size upon the floor of a building known as the mould-loft, in order that moulds or scurve-boards may be made, to which each frame is shaped or bent. To facilitate the work in the loft, the ship is divided into two parts called the fore and after bodies, being divided by

an imaginary line amidships, or a point near which the curvature of the lines is reversed. On the bodies are laid off the edges of the plating, the line of the stringers and keelsons, the undersides of the decks, the outline of the floors, etc. For the wooden vessels the moulds represent the shape and taper of the frame timbers. Pieces of timber are then selected and worked exactly to the moulds, their edges beveled to conform to the curvature of the vessel taken from the mould-loft floor, and the joints or butts carefully doweled together. For metal vessels the moulds are made to show the shape of the outer edge of the frame and the line of the floors; the object in thus moulding, shaping, and bending the frames is to have them their true shape, so that when put together they shall form the outlines of a vessel, agreeing with the plan of the naval architect, and giving, when the planking or plating is fastened to them, the complete outline of the hull. While this part of the work is going on, the shipwrights are preparing the foundation and laying the keel-blocks upon which the vessel is to be built.

**Ordering Material.**—For convenience in ordering the material of an iron or steel vessel an exact model of it is made in wood on a scale  $\frac{1}{4}$ th or  $\frac{1}{8}$ th of full size; on this model are marked off the stations or the frames, the deck-lines, the edges of the plating and stringers, and the plates laid off in their proper lengths so as to have a proper shift of the butt-joints. The dimensions of the frames and plates are then measured from the model, and after verification as to width in the loft are sent to the mills. An allowance is made for machining the plates, or such of them as form the outer strakes, for the inner strakes are often placed on the ship without planing the edges, the ends only being machined in order to have close joints for calking metal to metal.

**Keel-blocks.**—As the entire weight of the vessel must come upon the keel-blocks, it is essential that they shall have a very firm foundation, such as piling or concrete; they generally slope lengthwise toward the water, and are placed about 4 feet apart from center to center. Each block is built up of several pieces of timber, the bottom pieces offer of sufficient length to serve as a foundation upon which to build up the supports of the launching ways; the upper pieces are in some yards so put together as to permit of being removed from under the keel without splitting, while in others the removal of the blocks is effected by splitting out the cap pieces. The blocks are generally given an inclination to the foot of from five-eighths of an inch in heavy vessels to three-quarters of an inch in light ones, to facilitate launching.

**Keel.**—The first operation, be the ship of wood or metal, is to place the keel upon the blocks; if the vessel is of metal the keel may be constructed after one of several methods. The bar-keel consists of a plain bar in suitable lengths with scarfed butts, the plating of the garboard strakes being flanged or turned down against the bars, and riveted through and through. Another variety is the side bar-keel, which is built up of three parts, the middle piece extending above the keel proper to a depth equal at least to the floors, and the garboard strakes being riveted through in a manner similar to that employed with the ordinary bar-keel; this is one of the strongest of keels, and also one of the most costly. Another variety, and one that, in these days of cellular or double-bottom construction, finds general acceptance, is the flat keel; this consists merely of flat plates bent to shape. If the keel laid is a bar-keel of either type, the garboard strakes are at once put in place to afford a landing for the frames. The stem and stern post are set up, and, if the vessel is of wood, the deadwood and other pieces in the center line are bolted in place.

**Stem and Stern Post.**—The stem of a metal vessel is usually a simple forging rabbeted to receive the ends of the plating—that is, a recess is cut in it on each side so that the plates may end in it and form a fair and flush surface. The stern-post, if of a single-screw vessel, is quite an elaborate forging, although of late years castings of steel have been substituted for forgings with great success. The post is made up of two parts in one, first the post proper on which the plating ends, and through which the screw-shaft passes, forming incidentally a part of the stern bearing, and second the rudder-post or the support of the rudder; the two connected form a continuous frame about the propeller. In twin-screw vessels the stern frame is scarcely less elaborate, for provision is usually made for heeling thereon the shaft brackets or struts which support the screws. The frame must also receive the ends of the hull-plates and support the rudder.

require. In addition to the vertical stiffening, horizontal webs are sometimes worked on the opposite side of the bulkhead, with their ends securely bracketed to the ship's side.

**Decks.**—The upper deck, to which is carried the full scantling of the vessel, plays a very important part in the structural strength. The arrangement of the material subject to longitudinal stress may be compared to a beam of which the upper deck is the top and the keel the bottom flange, the outside plating forming the web of the beam; therefore in vessels of large size this deck is plated completely over in order to secure for the top flange of the girder the proper sectional area. On the ends of the beams are worked stringers of heavier plating than the balance of the deck-plating, making good connection with the sheer strake by means of heavy angle bars; the space between the stringers is filled in with plating as required. In wooden vessels the strength at the deck is made up through the waterways, thick strakes, and clamps, which are strong pieces of timber or plank running longitudinally.

The remaining decks of an iron vessel are worked in a manner similar to the upper deck. Where the frames pierce the plating staple-angles are sometimes worked about the frames to make them water-tight. Deck beams should be supported by stanchions; so far as possible these should be in the midship line, but for convenience of staterooms and deck arrangements they are sometimes worked two to a beam, and placed beside the joiner-work bulkheads.

**Fastenings.**—The fastenings of a wooden vessel are composed of copper and iron bolts, iron spikes, and treenails of wood. The plank is fastened generally by spikes or treenails, except at the butts, which are bolted. For additional security the frames, outside and inside planking, are often fastened together by through-bolts, driven from the outside and riveted on washers against the inside of ceiling. The deck plank is usually fastened by spikes. The fastenings of a metal vessel consist almost entirely of rivets, which are hammered into place while hot.

**Calking.**—When the planking is fastened the seams or slight spaces between the edges of the plank are filled with oakum, and this is driven in with great care until it is as hard as the plank. To hold the oakum the planks are laid with a slight bevel outward, about  $\frac{1}{16}$ th of an inch for each inch of thickness of plank; otherwise the oakum would be easily forced through the seam. An improved method is to cut a recess in the edges of the plank about midway of the depth, so that the oakum will spread into the recess and render it impossible to be driven through. After the calking the seams are paid with hot pitch or marine glue. In metal vessels all water-tight work must be calked metal to metal, that is, a slight layer of metal must be driven over against the adjacent metal until the joint is absolutely tight. This work was formerly done entirely by hand; now a calking-tool operated by compressed air or electricity is used, the blows being given with great rapidity.

**Launching.**—The vessel has been built resting upon the keel-blocks and shores; while here the shafting and propellers have been put in place, the rudder hung, the bottom painted, and all work below the water-line on the outside surface finished. Now the vessel is to be transferred from the fixed keel-blocks to a movable platform which shall allow the vessel to move easily and without damage into the water. This is done by building on each side of the vessel, about one-fourth of the breadth of beam from the keel, a platform or foundation to which the weight of the vessel shall be transferred. In laying the keel-blocks the bottom pieces were made of sufficient length to allow of their forming the foundation for this platform. On these are built up the groundways, which are shored to prevent spreading and are capped with strong pieces of timber, 3½ to 4 feet wide, with smooth upper surfaces; on these are laid the bilgeways, which are also large smooth pieces of timber, free to slide with the vessel; on the bilgeways are constructed the cradles, which are fitted to the ship's bottom; between the cradles and the bilgeways are fitted rows of long wedges of such thickness that when driven up the vessel will be lifted from the keel-blocks, and the weight brought to bear on the groundways. The upper surface of the groundways and the bottom surface of the bilgeways are coated with tallow, and the bilgeways secured to the groundways by pieces of plank at the bow so that they can not move until they are sawn asunder. Then the wedges are set up until the keel-blocks can be removed and all clear for launching; when all is clear, the planks at the bow

are sawn off, and the vessel, resting only on the greaser surfaces, begins slowly to slide down the inclined plane. She soon gains headway, and in a few seconds is in the water. After launching, the fitting of the joiner work and cabins, the putting together of the machinery, stepping and securing the masts and rigging of the ship, are proceeded with until the vessel is complete in all respects.

PHILIP HICHBORN.

**Ship-canals:** canals intended for the passage of ships proper; hence, therefore, canals to connect sea with sea, and thus by a short cut to obviate a long ocean navigation. Such canals are usually laid across an isthmus or peninsula. The Suez Canal is an apt instance; so also are the projected canals across the Central American isthmus and the isthmus of Florida. The CALEDONIAN CANAL (*q. v.*) of Scotland is an instance of a class of minor ship-canals. In another sense ship-canals are those proposed to connect routes of natural navigation (rivers or lakes), by allowing a passage of the vessels, whatever they may be, used in such navigation. To this class belong many of the works described in the cyclopædia under separate heads—e. g. the ILLINOIS AND MICHIGAN CANAL (*q. v.*); see also the article CANALS.

The importance of a navigable connection between the Atlantic and Pacific Oceans through the isthmus which connects North and South America calls for a condensed view of the chief plans proposed at different dates, and of the natural obstacles baffling them all up to the present. From the era of the Spanish conquest of America the search for the secret of the supposed natural strait was carried on along the whole coast-line of the two continents; and when this ceased, the possibility of the construction of an artificial route began to be discussed. Governments, companies, and individuals have devoted much time and money to the search for a practical route for a ship-canal. Tehuantepec, Honduras, Nicaragua, Chiriqui, the Isthmus of Panama (or Darien), and the Atrato river, have all figured in connection with this question, and a full statement of the various surveys and projects made prior to 1866 will be found in the report of the superintendent of the U. S. Naval Observatory (Admiral C. H. Davis), made in compliance with a resolution of the U. S. Senate (*Ex. Doc. 624*). See also *Engineering* (London), in a series of articles entitled *The Nicaragua Canal* (Feb. 24, 1893, *et seq.*).

The results of the surveys since 1875 of the American isthmus for ship-canals and their substitute, the ship-railway, will be found under *Nicaragua Canal* and *Panama Canal*, below, and in the article SHIP-RAILWAYS. Since 1875 important results at both Nicaragua and Panama have proceeded from efforts to construct the canals. The remaining projects have ended either in surveys and estimates, or in lapsed concessions from the governments on whose territory the canals were to have been constructed.

**Panama Canal.**—Across the Isthmus of Panama occurs, next to Nicaragua, the greatest depression yet found on the isthmus, the summit-level of the railway being 287 feet above sea-level. The route from Porto Bello or Chagres to Old or New Panama has been the established line of communication since 1658, nearly coeval with the first settlement in America. A survey was made in 1843 by the French engineer, M. Garela (*ingénieur-en-chef des mines*), of which the report was printed in the *Journal of the Franklin Institute*, and in the French *Journal des Ponts et Chaussées* (1844). George M. Totten, chief engineer of the Panama Railroad, subsequently made an estimate for a canal with locks, to cost from \$60,000,000 to \$115,000,000, according to the summit-level adopted. The survey was renewed by the U. S. Government, by Commander E. P. Lull, U. S. navy, resulting in the location of a practicable line for an interoceanic ship-canal, 26 feet deep, from the Bay of Aspinwall on the Caribbean Sea to Panama on the Pacific.

In 1879 Count Ferdinand de Lesseps made an appeal to the several nations to send delegates to a proposed congress to meet in Paris, to decide upon the route and the plan for an interoceanic canal between the Atlantic and Pacific Oceans through the American isthmus. On May 15 of that year the congress met in Paris. Twenty-four countries were represented. Count de Lesseps was elected president. The congress decided that a canal with a constant level was desirable, and that this canal should be by way of Limón Bay to Panama.

Immediately after the adjournment of the congress the Universal Interoceanic Canal Company was organized under

note the undertaking. For a full history and complete statement of facts see the *Florida, Atlantic, and Gulf Ship-canal Company*, published in New York (1881); also report of Gen. Quincy A. Gillmore, in the annual report of the chief of engineers U. S. army (1880).

**Cape Cod Ship-canal.**—To shorten the distance and avoid the dangers of navigating around Cape Cod a proposition for a ship-canal between Barnstable Bay on the north and Buzzard's Bay on the south has been brought forward. Probably the best route follows a natural depression between Sandwich on the north coast and Monument, at Buzzard's Bay, on the south, a distance of about 8 miles. At an earlier geological period this depression was a sea-channel separating Cape Cod from the mainland, and it is so low even now that within the nineteenth century the storm-tides have met each other.

Many examinations, surveys, and reports were made from 1776 to 1878, when Clemens Herschel, C. E., made an exhaustive report on the subject, and estimated the cost of a canal and jetties with a depth of 18 feet at mean low water, and a width of 111 feet, at \$2,000,000 in cash.

Although the State Legislature has granted many charters to different companies, yet very little actual work has been done on the construction of the canal. There are (1895) several bills for charters before the present session of the Legislature.

**Suez Canal.**—According to Diodorus Siculus (B. C. 60) there was a canal from the Gulf of Pelusium (not far from the present terminus of the canal) to the Red Sea. It was begun by Necos, continued by Darius, and finished by Ptolemy II. The canal was said to be wide enough for two galleys to pass abreast.

For the modern canal nothing was done except to make careful surveys until 1849, when the project of a ship-canal was finally taken up, to be carried through by Count Ferdinand de Lesseps. After the route had been carefully surveyed and favorably reported on, the Viceroy of Egypt granted the first concession to M. de Lesseps in Nov., 1854. At Constantinople, where de Lesseps had an interview with the prime minister, the project was favorably received; but through the interest of the representative of Great Britain, Lord Stratford de Redcliffe, the sanction was not given. In order to place the subject prominently before commercial nations de Lesseps wrote to the principal foreign ministers, asking that they would name engineers of high rank, and would secure their uniting in a commission to examine the routes for a ship-canal. The commission met and appointed a sub-commission to prosecute the study of the proposed route on the ground, which they did, and presented to Said Pasha a preliminary report dated Alexandria, Jan. 2, 1856. The commission rejected the plan for an indirect canal from Alexandria as "inadmissible from a technical and an economical point of view," and reported in favor of a direct route, making an estimate of 200,000,000 francs as the cost of the work. A second concession was given on Jan. 15, 1856, the terms of which were designed to satisfy the opposition which had already begun in Great Britain, and to guarantee fair returns to the stockholders who might invest. The viceroy made an official declaration for himself and his successors, subject to the ratification of the sultan, that the canal and all its ports should be open at all times as a neutral highway to every merchant ship passing from one sea to another, without any exclusive distinction or preference to persons or nationalities. The statutes which were to govern the company fixed its capital stock at 200,000,000 francs.

The Egyptian Government engaged to furnish a contingent of the fellaheen, and the work was at once begun. The location of the northern terminus of the canal was changed from Pelusium to Port Said. The first work on the canal was at this terminus, and was begun on Aug. 25, 1859, by de Lesseps in the presence of about 150 persons. For a description and illustration of the artificial harbor at Port Said, see HARBORS.

From Port Said the distance across the isthmus in a direct line is about 70 miles. The length of the canal is 100 miles, of which over 60 per cent. is through shallow lakes. The material excavated was usually sand, but in places it was necessary to blast through strata, 2 or 3 feet in thickness, of solid rock. The total excavation was 80,000,000 cubic yards.

On account of the complications with Great Britain and its opposition to the construction of a canal, obstructions were placed in the way of the work from time to time which greatly delayed its completion and increased its cost. The

most important result was the withdrawing of the fellaheen from the work by peremptory orders from the British Government to the viceroy. Although the work was delayed by this, it served to bring into use a much more extensive plant of machinery, specially constructed to perform work hitherto done by men. The appliances thus used were various and very efficient. With them the contractors excavated 50,000,000 cubic meters, with the assistance of less than 4,000 men and in the space of less than five years. The work was all performed in daylight.

The canal was formally opened by vessels from nearly all the maritime nations of Europe on Nov. 17, 1869. The canal at that time was in a very imperfect state, not being fully completed in width and depth, but the company has since finished the work and maintained the depth needed. The canal has a sufficient depth and width to permit the safe passage of ships drawing 25 feet of water. The following table shows the increase in the number of ships, tonnage, and receipts:

| YEAR.     | Number of vessels. | Net tonnage. | Receipts from tolls and passengers. |
|-----------|--------------------|--------------|-------------------------------------|
| 1870..... | 486                | 435,911      | * \$59,152                          |
| 1875..... | 1,494              | 1,887,578    | 5,296,157                           |
| 1880..... | 2,026              | 3,057,421    | 7,501,627                           |
| 1885..... | 3,624              | 6,335,753    | 12,423,254                          |
| 1890..... | 3,389              | 6,890,094    | 12,882,542                          |
| 1891..... | 4,207              | 8,698,777    | 16,789,113                          |
| 1892..... | 3,559              | 7,710,000    | 14,999,175                          |
| 1893..... | 3,841              | 7,710,000    | 14,183,722                          |
| 1894..... | 3,352              | 8,089,108    | 14,770,061                          |

\* Computed at 5 francs to the dollar.

In the concession it was laid down that the maximum charge was to be 10 francs per ton "of capacity." The business of the canal became so great that it was necessary to widen and deepen it. This work is (1895) nearly completed. The new dimensions are 31.2 feet depth; bottom width, 108.2 feet; surface width, 420 feet; area of prism, 8,240 sq. feet. There are sidings—called *gares*—excavated for the passage of vessels at several points; the radius of the curves is 2,000 feet. The cost of the canal as originally completed was \$95,000,000.

**The Corinth Canal.**—This canal extends from the Bay of Corinth to the Gulf of Athens. It was across this isthmus that the Athenians, 800 years before Christ, hauled their triremes, which are thought to have been of about 150 tons burden. The canal saves 185 miles (342 km.) from Adriatic ports and 95 miles (178 km.) from Mediterranean ports. The average tolls are 18 cents per ton and 20 cents per passenger. The length of the canal is 3.9 miles (6,290 meters), part of which is excavated in alluvial soil and part in calcareous and granitic soft rock. There is no lock or tunnel, it being a sea-level canal. There are generally quiet harbors at each end, but jetties are (1895) being constructed for further protection. The width of the canal is 22 meters (72 feet) at bottom, and 24-20 meters to 28 meters (79½ to 92 feet) at the low-water level. The depth of the canal below low-water level is 8 meters (26½ feet). The heaviest cutting is about 79 meters (259 feet); the average cutting is 45 meters (147½ feet). The amount of material excavated was 11,500,000 cubic meters (14,453,400 cubic yards). The total cost was nearly \$5,000,000. The work was begun in 1884, but suspended at various times by financial embarrassments. It was completed so as to permit its inauguration by the King of Greece on Aug. 6, 1893, but it was not opened to navigation until Nov. 9, 1893. Owing to the slips of the canal sides, developed in the original excavation, it was found necessary to construct retaining walls for rather more than half of its length. The total amount of masonry in these walls and used in protecting the slopes of the cuttings was 165,000 cubic meters (216,000 cubic yards).

**Cronstadt and St. Petersburg Canal.**—This is a work of great strategical and commercial importance to Russia. The plans were matured in 1874, and work was begun in 1877. The canal and sailing course in the Bay of Cronstadt are about 16 miles long together, the canal proper being 6 and the bay channel 10 miles, and extend from Cronstadt, on the Gulf of Finland, to St. Petersburg. The available depth prior to its construction was 9 feet in the river. The canal, opened in 1890, is navigable for vessels drawing 20½ feet; its greatest width is 350 feet and its least width 220 feet; the total cost was \$9,000,000. For a descriptive and historical sketch, see London *Times*, Oct. 17, 1884.

the headquarters of Gen. Braddock's army, and the site of several colonial forts built to protect the settlers from Indians. Pop. (1890) 2,213; (1890) 2,188.

JOHN C. WAGNER, EDITOR OF "NEWS."

**Shippigan'**: post-village in Gloucester co., New Brunswick; on the Gulf of St. Lawrence, near the northeast angle of the province: 254 miles N. of St. John (see map of Quebec, etc., ref. 3-1). It has a magnificent harbor, which serves as a port of refuge, and important herring, cod, and mackerel fisheries. It occupies an important point in the scheme to shorten the transatlantic passage. It is the proposed terminus of the Continental Railway, and from this port ferry-steamers are to cross to St. George's Bay, Newfoundland. Just beyond Shippigan is the wide flat island of Miscon, said to be the best district for plover in the Dominion. Pop. 2,500, nearly all French-Canadians. M. W. H.

**Shipping-articles**: See SEAMAN.

**Shipping, Law of**: the body of rules governing the ownership and employment of vessels, as well as the relations and conduct of persons engaged in their navigation. It is a branch of MERCANTILE LAW (*q. v.*).

**What is a Ship?**—The term has a very broad signification in this branch of the law, unless narrowed by a statute. Whether a particular water-craft is subject to the rules of shipping depends not on its size, form, capacity, or means of propulsion, but upon the use for which it was designed and to which it is put. Hence a floating elevator, a steam-dredge, and a floating bath-house have been treated as ships, because intended and employed for navigation and transportation. A bath-house built on several boats, with a view to its transportation whenever and wherever desired, is to be deemed the permanent cargo of the boats. *Public Bath No. 13, 61 Federal Reporter, 692.*

**Ownership of Vessels**.—This may be acquired by capture (see *The General Usages of War* under INTERNATIONAL LAW), by operation of law, as in the case of the bankruptcy or the death of the former owner, or by contract between the former and the present owners. A contract to purchase a vessel from a ship-builder and to pay the price in installments as the work progresses does not pass the title to the purchaser until the vessel is in a deliverable state and the purchaser is notified thereof, unless the parties stipulate that it shall pass sooner. Such has been the rule always in the U. S. (*Clarkson vs. Stevens, 106 U. S. 505*), and was finally established in Great Britain by the House of Lords in *Seath vs. Moore, 11 Appeal Cases 350 (A. D. 1886)*.

The present sale of a chattel passes title to the purchaser at common law, although the contract is oral, and the chattel is not delivered nor the price paid, except in cases within the statute of frauds. (See FRAUDS, STATUTE OF.) This rule is believed to apply to ships in the U. S. British courts, however, declare that "a ship is not like an ordinary chattel: it does not pass by delivering, nor does the possession of it prove the title to it," and that as well by the law merchant as by the Merchant Shipping Act (17 and 18 Vict., c. 104, §§ 55-65) a bill of sale is necessary to the transfer of title from the seller to the purchaser of a ship.

Because of the costliness of ships and of the risks and repairs incident to them, it has been customary from an early period for several persons to unite in their ownership. Generally the title of such persons is that of part-owners and not of partners—a form of title much older than that of partnership (see PART-OWNERSHIP), although by agreement they may constitute themselves partners. If part-owners of a vessel can not agree as to its employment, English mercantile law permits the majority in value to "employ it upon any probable design," upon their giving a stipulation to the dissenting owners, in a sum equal to the shares of the latter, either to restore the ship or to pay the value of such shares. Such dissenting owners then bear no part of the expense and reap none of the profits of the adventure. This rule is based on the idea that ships "are built to plow the sea, and not to lie by the walls"—that their employment is a matter of public concern. If the part-owners are equally divided, the court will decide between them. In the U. S. it has gone to the extent of ending such conflicts by forcing a sale of the vessel, but in Great Britain it never exercised such power until authorized by statute. (24 Vict. c. 10, § 8).

**Liability of Owners**.—English maritime law determined the liability of ship-owners for the conduct of persons in charge of the vessel on their behalf by the common-law rules of agency. (See AGENT.) In case of loss occasioned by their agents, their responsibility was coextensive with the

loss. Such was not the rule of the general maritime law of Europe. By that rule innocent owners were chargeable for the acts of the master and crew to the extent of their interest in the ship only, and if the ship was lost their liability was at an end. The reason given by Grotius for this rule is that men would be deterred from owning and operating ships if they were subject to the fear of an indefinite liability for the acts of the master. This fear induced Parliament to limit the liability of ship-owners (see preamble to 7 Geo. II., c. 15), although British legislation has not adopted fully the doctrine which prevails on the Continent; it leaves innocent owners responsible, in many cases, to the value of ship and freight immediately before the injury, although the ship be destroyed or injured by the same act, or afterward on the same voyage. (See 17 and 18 Vict., c. 104, § 503, and 25 and 26 Vict., c. 63, §§ 54-56.) The U. S. Government has abolished the English rule which it inherited, and has adopted the continental rule, graduating the liability by the value of the ship after the injury as she comes back into port, and the freight actually earned; and enables the owners to avoid all responsibility for acts done without their privity or knowledge, by giving up the ship and freight, if still in existence, in whatever condition the ship may be; and without such surrender subjects them only to a responsibility equivalent to the value of the ship and freight as rescued from the disaster. U. S. Rev. Statutes, §§ 4282, 4283; *The Scotland, 105 U. S. 24.*

**Master's Duties and Powers**.—The master is responsible for the proper navigation of the ship, and is entitled to the obedience of all the officers and crew. He is bound to exercise due care and skill in keeping the vessel in a seaworthy condition, and in properly guarding all interests committed to him by the owners of the ship or of the cargo. Accordingly, he has authority to make contracts relative to the usual employment of the ship and to its repairs and necessities. He may even sell it when the prosecution of the voyage becomes impossible and immediate necessity to sell exists. His power to pledge the ship and crew is described in the articles on BOTTOMRY and RESPONDENTIA (*qq. v.*). When the vessel is in her home port, or subject to the supervision of the SHIP'S HUSBAND (*q. v.*), the master's implied authority is greatly limited.

**Nationality and Registration**.—The registration of British ships begins with the Navigation Act of 1660 (13 Car. II., c. 18, § 10), whose professed object was "the increase of shipping and encouragement of the navigation of this nation, wherein, under the good providence and protection of God, the wealth, safety, and strength of this kingdom is so much concerned"; but whose real objects, according to Blackstone, were dealing a blow to the sugar islands and "clipping the wings of those our opulent and enterprising neighbors." (1 *Commentaries* 418.) Under this act ships might be registered as a rule by English owners, whether built in England or elsewhere; but a statute of the next year required them to be of English building. (13 and 14 Car. II., c. 11, § 6.) This remained the policy of Great Britain until 1850. The subject is now governed by 17 and 18 Vict., c. 104, which provides that any ship may be registered which is owned by natural-born subjects, or by persons legally naturalized or denized, or by corporations established under the laws of, and having the principal place of business within, the British dominions. Unless registered, a ship is not to be recognized as a British ship, so as to be entitled to any of the advantages or to the protection enjoyed by such a ship, or to use the national flag or to assume the national character.

The registry laws of the U. S. are based upon an early act of Congress (ch. i. of 1792) which copied very closely the English statute then in force. (26 Geo. III., c. 60.) Only vessels built within the U. S. and belonging wholly to citizens thereof, and vessels which may be captured in war by citizens of the U. S. and lawfully condemned as prize, or which may be adjudged to be forfeited for a breach of the laws of the U. S., being wholly owned by citizens, or vessels wrecked in the U. S. and purchased and repaired by a citizen, in case the repairs cost three-fourths of the value of the vessel when repaired, can be registered (U. S. Rev. Stat., §§ 4132 and 4136), with the exception of a limited class provided for by ch. 63 of the laws of 1892 and other special statutes. The place of registration is the vessel's home port. In order to register a vessel, the owner must take and subscribe the oath required by statute, must give a bond that the certificate of registry shall be used solely for this vessel, must produce a certificate of construction from the carpenter

ready for transportation. The vessel, resting on blocks along its keel and bilges, is supported on platform-cars 38 feet wide, carried on 240 wheels, arranged in four lines to run on two tracks of standard gauge, 18 feet apart between

of the gate proper is 17 feet lower, or 13 feet below high water spring tide, and retains a minimum depth of 32 feet in the basin. The lifting-dock at the inner end of the basin is 270 feet long. Vessels will be able to enter or leave during the high stages of the tide, while the excellent anchorage off shore, and the large storage capacity of the basin, insure a continuity of traffic uninterrupted by the fluctuations of the bay. This pioneer ship-railway is (1895) more than three-fourths finished. Awaiting the completion of this great work are many others that are projected, and whose construction will doubtless quickly follow.

FIG. 1.

centers. The gridiron on which the ship and cradle move up and down in the lifting-dock is like the deck of a bridge with floor-beams arranged in pairs, slightly separated to admit the hydraulic presses between them, and are connected in the usual way by track-stringers under the rails. The hydraulic presses are 25 inches in diameter and twenty in number, and are designed to lift a vessel carrying 1,000 tons of cargo, together with the cradle and gridiron, a total weight in all of 2,500 tons. They are placed 21 feet apart longitudinally and 64 feet transversely, and have a maximum stroke of 40 feet. The cross-heads on the inner cylinders or rams are attached to the floor-beams with eye-bars.

When a vessel is to be lifted the gridiron, with a cradle on its tracks, is lowered, and the vessel is hauled into position with hydraulic capstans. Water is then forced into the presses until the keel-blocks are brought to a bearing; next the bilge-blocks are drawn into place and the pumps are again started, raising the gridiron in less than ten minutes to a position where its tracks are slightly above those of the railway. A connected system of heavy iron chocks, supported by the masonry, is then moved under the ends of the girders by hydraulic power, the gridiron is lowered to a bearing on them, and its tracks are connected with those of the railway. Two locomotives will haul the ship across the isthmus in less than two hours, and the lifting-dock at the other end by a reverse operation quickly replaces it in the water.

The track is composed of rails weighing 110 lb. per yard, laid on very heavy ties, some of which extend under all four rails. It is stone-ballasted, on the most solid cuttings and embankments, and is characterized by smoothness and rigidity.

A novel feature is the way in which the difficulties arising from the immense tides of the Bay of Fundy are overcome. A basin 500 feet long and 300 feet wide is constructed at the south end. The entrance-gates and seawalls are of heavy masonry, the top being at the common level of the top of the lifting-dock and railway. The top

about 300 miles, while the country through which it is to run favors facility and permanence of construction.

**Columbia River Railway.**—A boat-railway along the Dalles of the Columbia river, U. S., between Three Mile Rapids and Celila, is under way, Congress in Aug., 1894, having appropriated \$100,000 for the preliminary work. The novel feature of this work is the proposed use of one-degree curves on the railway. The track would be similar to the Chignecto ship-railway, and the general features are also alike with some variation in details to suit the flat-boat traffic for which it is designed.

**The Tehuantepec Railway.**—This was first proposed by Capt. James B. Eads in 1879, and with characteristic energy, in a few years, in the face of almost universal opposition, he pushed through all the stages of preliminary surveys, detailed plans, congressional inquiries, procurement of concessions from Mexico, and some actual construction at a cost of more than half a million dollars. A table of the distances the railway would save is unnecessary, for it is plain that lengths and breadths of continents are involved. With the opening of the Suez canal, one of the two great barriers to interoceanic navigation was removed. The completion of the Tehuantepec ship-railway would remove the other.

Tehuantepec was selected as the proper location because of its greater proximity to the U. S., its superior advantages

FIG. 2.

in distance and time to the main more healthful climate, the easy gra

pass C. A. Schott was enabled to trace out with chalk on the iron gun-turret (sides 11 inches thick) of an ironclad vessel its magnetic equator, and found its plane inclined to the horizon at an angle of nearly 90° dip; after revolving the turret 180°, the line of no polarity again was traced out, when the plane, passing through the intermediate horizontal position, gradually approached its former place after a lapse of about twelve hours; it probably takes weeks before the fixed position is reached, depending on the action of the iron. Inside such turrets the magnetic intensity is very much weakened, but 12 per cent. was found to be left in the above case. The reader is referred to Sir George B. Airy's *Treatise on Magnetism* (London, 1870) and to the *Admiralty's Manual for the Deviations of the Compass*, by Capt. F. J. Evans, R. N., and Archibald Smith (London). This manual is the standard work on the subject of the deviation of the compass.

The earth's magnetic force has been represented by three component forces, to the ship's head, to the starboard side, and to the keel respectively; similarly, the components of the combined total magnetic force of earth and ship are in these directions; their respective differences or components of disturbance can be expressed by linear equations possessing each a constant and three coefficients, which are to be determined by experiment for each ship and position of compass, and must be numerically worked out by application of the method of least squares.

The general character of the deviation in wood-built sailing ships, with compass as usual on the quarter-deck and over the middle fore-and-aft line of the ship, is found as follows: No deviation when heading (magnetically) N. or S.; greatest deviation when heading (magnetically) E. or W.; deviation easterly when head in eastern semicircle, and westerly when head in western semicircle. In steam-vessels, with the compass aft, these directions of no and maximum deviation will often be found displaced by several degrees, yet preserving their general symmetrical character. In the southern (magnetic) hemisphere the deviations are reversed, though for steam-vessels they may be only partially changed. In iron-built ships an individual character has to be recognized. The points of no deviation are shifted from the N. and S. points, and lie nearly in the direction (by compass) of the ship's head and keel while building; they may not be opposite to each other, nor be removed exactly at right angles from the point of maximum deviation. In general, the deviation is easterly when the part of the ship which was S. in building is E. of the compass; westerly when W. The deviation described above is technically known as the semicircular deviation, and may be expressed by  $B \sin \zeta + C \cos \zeta$ . In the general deviation formula  $\delta = A + B \sin \zeta + C \cos \zeta + D \sin 2\zeta + E \cos 2\zeta$ , the angle  $\zeta$  being the azimuth or the compass-bearing of the ship's head reckoned from the disturbed magnetic meridian positive to the eastward; it is a constant, generally small, + if easterly deviation is in excess. +  $B$  is approximately the deviation at E., and +  $C$  at N.; in the last terms of the harmonic function involving  $2\zeta$ , and which are technically known as the quadrantal deviation, +  $D$  is the mean deviation approximately at N. E. and S. W.; the coefficient  $E$  is generally small or zero; the deviation  $\delta$  is reckoned + when the N. end of the needle is drawn to the E.; and the above empirical expression applies, provided the deviation on any course does not much exceed 20°, or about two points, in which latter case the formula becomes more complicated. The correct magnetic course will be  $\zeta = \zeta + \delta$ . The semicircular deviation rarely exceeds 10° in wood-built vessels, but in iron-built ones may reach double and treble this amount. The quadrantal deviation seldom exceeds 1° or 2° in wood-built ships, but in iron-built ones may reach three or four times this amount. The semicircular deviation is principally due to the effect of permanent or sub-permanent magnetism. The quadrantal deviation, which undergoes no change with a change in the ship's place, is mainly due to the effect of induced magnetism.

The heeling error in wood-built ships is not appreciable, but in iron-built ones it may be serious; generally, the error vanishes with the ship's head at or near E. or W., and attains a maximum value with headings at or near N. or S. The sign of the error changes with a change from the northern (magnetic) to the southern hemisphere. In the northern (magnetic) hemisphere, with the compass above the upper deck, the majority of iron ships have the N. end of their compass-needle drawn to windward, and in the southern hemisphere to the leeward. The heeling error is

due to the joint disturbing effect of the vertical components of permanent and of induced magnetism.

The values of the coefficients  $A, B, C, D, E$ , are found directly from observations, the deviation of the compass being observed with the ship heading in a number of equidistant points around the horizon, usually either 32, 16, or 8. If the deviation is observed on four cardinal compass-points,  $D$  remains indeterminate; if on four quadrantal compass-points,  $E$  remains indeterminate. These observations are made by swinging the ship (or allowing it to swing by the tide), and noting for the several headings the bearing of a distant object, or by reciprocal bearings if the locality is confined, or when at sea by azimuths of the sun, the local time and latitude being known. The deviations being determined for a number of points, they may be plotted on what is known as Napier's diagram, and graphically interpolated by drawing a curve with a free hand through the several fixed positions. The deviations for any compass course will then become known. They may also be tabulated. If we deduce numerically the coefficients  $A, B, C, D, E$ , we can compute directly the values of  $\delta$  for plotting or tabulation. In either case we know the correct magnetic course corresponding to the disturbed or compass course, as well as the reverse of the compass course belonging to any correct magnetic course.

It has been remarked that inside iron turrets the magnetic intensity is greatly diminished; the same is the case with nearly all iron ships, the directive force of the needle being diminished. The relative horizontal force is found by means of the number of oscillations in a given time of a small needle, and the proportion of the disturbed to the undisturbed horizontal force, usually called  $\lambda$ , is determined from oscillations in four equidistant azimuths. It is usually less than 1, and is closely connected with the coefficient  $D$ , as may be surmised from the fact that  $\lambda$  is due to the effect of the horizontal induction of soft iron.  $D$  and  $\lambda$  are nearly constant. A knowledge of the value of  $\lambda$  is of importance; by its assistance the values of  $B$  and  $C$  may be found without swinging the ship from observations of  $\delta$  and  $\lambda$  on one course; similarly, observing on two courses, we may determine  $B, C, D$  and  $\lambda$ . The value of  $\lambda$  is further needed in the computation of the heeling error, which is expressed—

$$\left(D + \frac{\mu}{\lambda} - 1\right) \tan \theta \cdot i \cdot \cos \zeta$$
 for a heel of the vessel of +  $i$  degrees to the starboard. Here  $\mu$  is the ratio of the disturbed vertical force at the compass to the earth's vertical force; it is found by means of oscillations of the dipping-needle in the plane of the magnetic prime vertical;  $\mu$  changes with a change in the geographical position;  $\theta$  is the magnetic dip. It is therefore not actually necessary to heel the ship in order to determine the heeling deviation. It should be added to the general deviation table.

The mechanical correction of the deviation of the compass is properly resorted to in case no suitable position for the standard compass can be found where the deviations are comparatively small; in ships built head S. (northern hemisphere), and intended for navigation in northern magnetic dips, the compass should be placed as far forward as practicable. It may also be elevated 3 or 4 yards above deck. The semicircular deviation may be corrected mechanically, either by means of two magnets or by one magnet; the quadrantal deviation may be corrected by a mass of soft iron placed near the level of the compass; the same may be effected by the mutual action of two compasses placed side by side; the heeling deviation may be corrected by the application of a vertical magnet. In mechanically corrected compasses there is always some danger that, with change of geographical position, loss of magnetism of magnets, and change in the sub-permanent magnetism of the hull, deviation may reappear, though the disturbing force may have been completely neutralized in one place and at one time. It is therefore never to be trusted, and, as a rule, deviation tables should be formed whether mechanical corrections have been applied or not.

An excellent collection of important memoirs, entitled *A Series of Papers from the Transactions of Foreign Societies by Poisson, G. B. Airy, A. Smith, F. J. Evans, W. W. Rindell*, with other papers and documents, has been published by the British Admiralty.

C. A. SCHOTT.

Revised by FRANK H. BIGELOW.

**Ships of War:** vessels built and armed for offensive or defensive purposes. Modern war-ships include the tor-

smooth-bores and two 8-inch Parrott rifles. Though her speed was only about 6 knots at the best, this vessel performed most valuable and effective service throughout the war, both before fortifications and on the blockade. In a period of about six months she was struck some 193 times, but never forced to go into a home port or to depend upon outside assistance for repairs. The *Monitor* (*g. r.*) was built of iron under the superintendence of, and from an original design by, Ericsson. The opportune appearance of the *Monitor* in Hampton Roads in Mar., 1862, and her successful combat with the *Merrimac*, gave a fictitious value to this vessel as an example of naval architecture. Nevertheless, these vessels performed invaluable services and furnished the type of modern coast-service ironclads and a system of armament which has been followed in the most powerful ironclads of recent construction. At the termination of the war it was determined to build four sea-going double-turreted monitors without overhanging armor-shelf at either the end or the sides. These were the *Miantonomoh*, the *Monadnock*, the *Terror*, and the *Amphitrite*. Their hulls were of wood, and were armored with laminated plates an inch thick, with a total thickness of 6 inches at the sides and 12 inches on the turrets. The *Miantonomoh* made a voyage to England, where she attracted much attention, and was no doubt the progenitor of the *Devastation*; the *Monadnock* was sent around Cape Horn to San Francisco. In 1874 these vessels were broken up and rebuilt into the double-turreted monitors of the same names.

*Improvements in the Construction of Ironclads.*—During the period of the civil war in the U. S. construction of ironclads proceeded rapidly in Europe, but until a later period it was more influenced by the developments in artillery than by the results of the war. The introduction, in 1864, of the 7½ and 15½ ton guns into the French armaments made the *Flandre* class ineffective before they were completed. In 1865 the *Océan* was begun, and later the *Marengo*, the *Suffren*, and the *Friedland*, after the same type, only the latter being completely of iron. They were protected at the water-line by 8-inch armor. The armament consisted of four 23-ton guns mounted in a central battery protected by 6½-inch armor, and four 15½-ton guns in barbette turrets at each of the four corners, projecting beyond the sides of the ship, and armored with 6½-inch plates. The *Friedland* differs from the other ships in having only two barbettes, each armed with a 23-ton gun. In 1868–69 a fourth group of ships was begun, the *Richelieu*, the *Colbert*, and the *Trident*, plated with 9-inch armor and very similar to the preceding group, the excess of 1,200 tons displacement being devoted mainly to armor and armament. The hulls of these ships were constructed of wood, except the extremities forward and abaft of the central battery, which were of iron. Such was the construction of the French ironclad navy up to the time of the Franco-German war.

E. J. Reed, appointed in 1862 to the office of chief constructor of the British navy, undertook the building of the *Bellerophon*, in which the cellular system of construction was first fully introduced, realizing a considerable saving in weight with great increase in the strength of the structure, and obtaining a system of water-tight subdivision which is the only protection against rams and torpedoes. Designs for the best mode of defense combined with the most powerful means of attack sprang up with the rivalry between guns and armor. For masted ships Capt. Coles advocated the turret system and Mr. Reed the broadside system, each striving to give the utmost protection armor could afford to the battery and other vital parts, while enabling the largest guns to be worked safely under these defenses. The broadside system armored the battery and the water-line, while the sides and the upper portions of the ships remained much as in the older frigates. The turret aimed at lower sides, as offering less target to the enemy, while affording an all-round protected fire. In 1862 the *Enterprise*, the *Favorite*, and the *Research* were adapted to Mr. Reed's principle—the belt and the battery—upon which, also, with the addition of indented ports at the corners of the battery, to give wider range of fire, were built the *Pallas*, the *Penelope*, the *Bellerophon*, and the *Hercules*. In the *Sultan* an upper-deck battery with four guns was added. On the *Sultan* pattern the *Audacious* and several other vessels were built. As the guns increased in size the batteries decreased and the guns became fewer, but the belt remained.

The *Monarch*, ordered in 1865, was designed as a sea-going rigged turret-ship having 7-inch armor, a free-board of 14 feet, and an armament of four 25-ton guns in two turrets

plated with 8-inch and 10-inch armor. Then came the *Captain*, a ship designed by Capt. Coles and Messrs. Laird in rivalry of the *Monarch*. She was intended to combine a low free-board with the qualities of a sea-going frigate, and the result of her first cruise seemed to indicate the value of the combination; but an investigation of the calamity of her capsizing in the Bay of Biscay, on the night of Sept. 6, 1870, with 500 men, only eighteen of whom were saved, showed that, in comparison with the other qualities, the small stability due to lack of free-board was a fatal error in her design. This disaster led to more complete and exact investigations of the stability of ships than had ever before been customary. A sea-going mastless turret-ship, or improved and enlarged monitor, was then devised, and three such ships were built—the *Devastation*, the *Thunderer*, and the *Fury*.

The *Devastation* is a mastless, twin-screw, sea-going turret-ship, 285 feet long, 62 ft. 3 in. beam; mean draught, 26 ft. 8 in.; displacement, 9,300 tons. Her sides, which rise 4 ft. 6 in. above the water-line right aft, are protected along the whole length by armor 12 inches thick; right forward this belt drops to 6 inches above the water-line, and is covered by an armored deck, 3 inches thick, arranged so as to give great support to the bow in ramming. Armor of the same thickness covers the deck aft. On the middle of the upper deck there is a raised breastwork about 150 feet in length, protected by 10-inch and 12-inch armor, covered by a deck 2 inches thick and 11 feet above the water, forming a glacis for two turrets, each containing a pair of 35-ton guns, protected by armor 12 and 14 inches

Fig. 1.—*Devastation*.

thick. All the necessary hatches, openings, smoke-pipes, etc., are led up by iron trunks to a light flying-deck which extends between the two turrets, slightly overlapping each. The sides of the vessel above the armor-belt are continued, forming an unarmored superstructure extending 9 ft. 3 in. above the water-line forward, and to the height of the breastwork throughout its length and slightly abaft it, the open deck aft having 4½ feet free-board. The trial at load-draught showed a speed of 13.84 knots, the engines developing 6,650 indicated horse-power. She carries 1,350 tons of coal, which enables her to steam 4,700 knots at 10 knots an hour.

In 1894 the *Devastation* was refitted throughout, supplied with new machinery and armament, and extensive internal rearrangement. The tables at the end of this article give the present outfit.

In the construction of the third ship, the *Dreadnought*—first named *Fury*—a new design was followed, making the breastwork of the same width as the ship itself—in other words, raising the armored side of the ship to a level with the upper deck of the breastwork. The *Dreadnought* was 35 feet longer and of over 1,500 tons greater displacement than the *Devastation*, and the armored belt was carried for the whole length of the ship at the same height above the water-line, increased to 14 inches thickness amidships. In 1885 this vessel, whose design was then sixteen years old, was commissioned as the flagship of the British Channel Squadron.

In 1872–73 the Italian first-class battle-ships *Duilio* and *Dandolo* were begun. They were the first vessels of the central-citadel type with revolving turrets *en échelon*. For their general design the naval authorities accepted the view of the British committee on designs, trusting for both buoyancy and stability to their unarmored raft. The principal dimensions are as follows: Length between perpendiculars, 340 ft. 11 in.; beam, 64 ft. 9 in.; mean draught, 26 ft. 7 in.; displacement at deep load-line, 11,200 tons.

*The "Admiral Class" of British Vessels.*—Following the *Inflexible*, the British built the *Ajax* and the *Agamemnon*, reduced copies of the first vessel, and then the *Colossus* and the *Edinburgh* of the same type, with 18 inches side-armor and armed with 43-ton breech-loading guns. A great gain was made in the speed of the latter two vessels over their predecessors, partly by a better form and partly by improved propelling machinery, by which much greater power has been obtained from the same weight of material. The "Ad-

FIG. 4.—Collingwood.

miral" class, of which the *Collingwood* was the first, begun in 1880, followed by the *Rodney*, the *Howe*, the *Anson*, the *Camperdown*, and the *Benbow*, in 1883-84, while following the same system of construction, have their battery mounted *en barbette*. This modifies the distribution of the armor by dispensing with the upper part of the citadel—necessary with turrets to protect their training, loading-gear, etc.—and allows the maximum thickness of the armor to be concentrated on the water-line where required to protect the machinery and the boilers. A part of the weight thus saved, and that due to the less weight of barbettes over turrets, is devoted to ordnance; for the *Howe*, the *Camperdown*, and the *Anson* carry four 66-ton guns each, the *Rodney* four 68-ton guns, and the *Benbow* has two 111-ton guns. In addition to the heavy guns they all carry six 6-inch guns in a machine-gun proof battery on the upper deck, between the barbettes.

*British Turreted Ships.*—The steady progress of France and Italy in the building of armored vessels of the first class had in 1884-85 aroused the attention of the British to the probability that if their rate of construction were to continue the French fleet would soon be superior to theirs, and eminent authorities contended that upon certain methods of comparison the French fleet was then the more powerful. The relative merits of the central-citadel type of British battle-ship and the completely armor-belted battle-ships of the type of the *Amiral Duperré* received careful attention, and though most serious allegations were made by Sir E. J. Reed, popularly considered an authority, against the safety of the citadel-ships when their ends were riddled by shot, the balance of favor seems to remain with the British type. As the result of this discussion Great Britain laid down in 1885 two turreted battle-ships, the *Victoria* (afterward sunk by collision with the *Camperdown*) and *Sans Pareil*, of 10,470 tons displacement each, the armament consisting of two 110-ton 16½-inch guns in a single turret forward, protected by 18-inch compound armor, and twelve 6-inch guns in broadside on the upper deck, protected by a 3-inch steel side and steel traverses. The citadel is 170 feet long and the armor 18 inches thick at the sides. Also were then begun the *Nile* and *Trafalgar*, two double-turreted battle-ships of type similar to the *Inflexible*, of 11,940 tons displacement. Their armor-belt is of unusual length and 20 inches thick. The two turrets, each mounting two 66-ton guns, are situated, like the *Dreadnought's*, on the middle line, but, unlike this ship, the *Nile* and *Trafalgar* have a broadside battery of eight 5-inch guns between the turrets. These vessels attained on trial in 1890 a speed of 17 knots.

These vessels were regarded when designed as the maximum displacement and power to be hereafter required, and indeed it was predicted by some authorities who favored the building of protected cruisers that these vessels might be the last ironclad battleships. They were hardly launched when the British authorities formulated in 1889 the most

extensive programme ever adopted by them. Under the title of the Navy Defense Act \$105,000,000 was appropriated for building and completing by Apr., 1894, 70 vessels to carry 566 guns, having an aggregate of 336,000 tons displacement and of 594,000 horse-power. These vessels comprise 10 armored battle-ships, 8 of the first and 2 of the second class; 40 protected cruisers, 9 of the first and 31 of the second class; and 18 torpedo-vessels. The distinguishing features of the programme were the rapidity with which the vessels were to be built, the great increase of engine-power and speed, and the increase in size and power of the armored vessels. Nine out of ten of these are barbette-vessels, in contrast to the recent turret-ships, and are of greater free-board and superior sea-keeping qualities to the earlier vessels. The *Royal Sovereign*, the first of these battle-ships, was completed in Apr., 1892. The rapidity of construction surpasses all previous records in the building of great war-ships, as the *Royal Sovereign* was laid down in Sept., 1889. This vessel is the largest battle-ship hitherto constructed for the British navy, and has six counterparts, named the *Renown*, *Repulse*, *Ramillies*, *Resolution*, *Revenge*, and *Royal Oak*. The eighth vessel of this class is a turret-ship, the *Hood*. The armament of the *Royal Sovereign* comprises four 13½-inch 67-ton guns, mounted in barbette in pairs, and firing a projectile weighing 1,250 lb. with a powder-charge of 630 lb.; ten 6-inch 100-pounder quick-firing guns, double-banked, the four on the main deck being mounted in casemates protected by 6-inch armor, while the six on the upper deck are mounted in sponsons; sixteen 6-pounder and twelve 3-pounder quick-firers, 8 small machine-guns, and two 9-pounder field-guns. The auxiliary armament is distributed all over the ship and extends from bow to stern. The ship is also fitted with seven torpedo-tubes, of which two are submerged. The following table gives the principal dimensions of the *Royal Sovereign* and her predecessor in design, the *Trafalgar*, and includes the results of actual trials for speed and power as obtained in smooth-water trials:

| DIMENSIONS, ETC.  | Royal Sovereign. | Trafalgar.   |
|---|------------------|--------------|
| Length.....   | 390 ft.          | 345 ft.      |
| Breadth.....  | 75 ft.           | 73 ft.       |
| Draught, mean.....  | 27 ft. 6 in.     | 27 ft. 6 in. |
| Displacement, tons.....   | 14,150           | 12,500       |
| Free-board } forward.....   | 19 ft. 6 in.     | 11 ft. 3 in. |
| } aft.....  | 18 ft. 3 in.     | 11 ft. 3 in. |
| I. H.-P. } natural draught.....   | 9,700            | 8,440        |
| } forced draught.....   | 13,300           | 12,900       |
| Speed } natural, knots.....   | 16.77            | 16.22        |
| } forced, knots.....  | 18.0             | 17.28        |
| Coal carried at the designed load-draught, tons.....                    | 900              | 900          |
| Coal endurance at 10 knots.....   | 5,000            | 5,000        |
| Total weight of armament, tons.....                                     | 1,410            | 1,065        |
| Weight of auxiliary armament, tons.....                                 | 500              | 435          |
| Height of heavy guns above water-line.....                              | 23 ft.           | 15 ft.       |

| } protective deck.....  | 3 in.            | 3 in.        |
| Total weight of armor and backing, including protective deck, tons..... | 4,560            | 4,400        |

*Growth of the French Navy.*—The modern navy of France dates from the close of the Franco-German war, when a programme was elaborated, according to which the armored fleet was to consist of 16 first-class ironclads, 12 second class, and 20 coast-service vessels of two classes. It was then definitely decided to use only iron or steel in future construction, a conclusion which was arrived at very tardily considering the progress upon the opposite side of the Channel.

The *Redoutable*, 8,800 tons, the first vessel built in accordance with the new programme, was begun in 1872 upon designs of M. de Bussy, and was then classed as a first-class ironclad. The *Dévastation* and *Poudroyant* (since named *Courbet*), ships of nearly 10,000 tons displacement, were begun in 1876 upon the same general plans as the *Redoutable*, masted, high free-board, central battery.

The *Amiral Duperré*, begun in 1876, has proved the type upon which the later French ships have been designed without substantial variation, excepting only that the later vessels have been fitted with military masts instead of the full ship-rig of spars and sails. The designers, believing that mastless low free-board turret-ships would not make good seagoing battle-ships, and in order to reduce the armored area and increase its thickness, discarded the central battery of the preceding first rates, which was also no longer suitable to the heavy guns required, and mounted on the *Amiral Duperré* four 13½-inch 48-ton guns, each in an armored bar-

British Battleship Royal Sovereign.

United States Protected Cruiser Columbia.

cipal dimensions are: Length, 348 feet; beam, 69½ feet; mean draught, 24 feet; free-board, 11½ feet; displacement, 10,300 tons. There is a belt of 18-inch armor extending over slightly more than half the length, rising 3 feet above the water-line, and extending 4½ feet below it. The under-water protective decks at the ends of the belt are 3 inches thick, and the armor-deck over the belt 2½ inches thick. Above the 18-inch belt and for the same length the side is covered with 5-inch armor to the upper deck.

The armament consists of four 13-inch guns mounted, two in a turret, one forward on the central line of the ship and one aft, each turret protected by 17-inch armor. At a higher level than these turrets are four others of 8½-inch armor, each containing two 8-inch guns. The battery is thus so arranged that four 8-inch guns fire straight ahead and four right astern, in addition to the 13-inch guns. There are also four 6-inch guns protected by 5-inch armor, two on each broadside on the main deck at the same level as the 13-inch guns. There are twenty-eight rapid-firing and machine guns and six torpedo-tubes. The battery of these vessels far exceeds that of any vessel in the world of their size, and equals that of any ship. The engines are of 9,000 I. H.-P., and a maximum speed of 16½ knots is expected, with a sustained sea-speed of 15 knots. The normal coal-supply is 1,400 tons, and the bunker capacity 1,800 tons.

The seagoing battle-ship Iowa was authorized in 1892 and begun in 1893. This vessel will exceed her predecessors in size by about 1,000 tons and in speed by a knot, but will be of about the same general design, although greatly improved by considerable increase of free-board forward and better security against interference of the lines of fire of the guns of the battery.

In 1895 Congress authorized two additional battle-ships and six composite gunboats of 1,000 tons displacement.

The Texas and Maine, begun in 1889, should be, according to the latest classification adopted in the British navy, rated as third-class battle-ships. The Maine has been officially called an armored cruiser in the U. S.

#### CRUISERS.

There no longer exists in the classification of war-vessels a definite size or class which may actually be distinguished as armored or unarmored, as was the case so recently as 1880. Then began the extensive introduction of armored decks in all classes of cruisers, and since then the rapid improvement in rapid-firing and machine guns, and also the improvement in machinery with greater possibilities of speed, have tended to a rapid increase in the size of cruisers, and an increased amount of armored protection by the use of thin armor-plating on the sides in addition to protective decks, armored protection for individual guns, and cofferdams of water-excluding material. The use of sails in the larger cruisers has practically disappeared, and the greater dependence upon fuel has also tended to increase the size of these ships in order to increase the supply of coal carried, and thus increase the endurance at sea under steam.

The following tabulated particulars relate to eight of the most important cruisers in the world:

| DIMENSIONS, ETC.                 | United States. |               |               | Spain,                | Russia,       | Great Britain. |              |              |

\* This table consists of actual trial data, excepting the Rurik and Powerful, given as designed.

*Cruisers of the U. S. Navy.*—The armored cruiser New York, begun in 1890 and completed in 1893, is of the same type as the Blake and Blenheim of the British navy, but slightly inferior in size and battery-power. She has an armored protective deck the whole length of the ship, extending 4 ft. 9 in. below the water at the side to a foot above the

water amidships; it is 6 inches thick on the slopes, 3 inches at the flats, reduced to 2½ inches at the ends of the vessel. In addition to this there is a belt of 5-inch armor in wake of the machinery spaces between the protective and main decks. Behind this belt is a cofferdam or cellular space 3 ft. 6 in. deep, extending all around the ship, filled with cellulose, a very light and water-excluding material. The armament consists of six 8-inch guns, two mounted in a barbettes forward plated with 10-inch armor, two similarly mounted aft, and one on each broadside amidships on the spar-deck. Twelve 4-inch rapid-firing guns are mounted in sponsons of 4-inch armor on the main deck, and eight 6-pounder guns in 2-inch armored sponsons on the same deck. The 8-inch guns are 25 feet and the 4-inch guns 16½ feet above the designed load-line. There are six torpedo-tubes for ejecting Whitehead torpedoes above the water-line, one forward and one aft and two on each broadside. There are twin-screws, and each screw has two sets of three cylinder triple-expansion engines, making four sets of engines, each in a separate water-tight compartment. It is estimated that the vessel can maintain at sea a speed of 18½ knots.

The first-class cruiser Brooklyn, authorized in 1892 and begun in 1893, is similar in design to the New York, but of greater size and armament.

The Columbia was built for the express purpose of preying upon commerce, and when begun in 1890 it was stated by the Secretary of the Navy that "no merchant vessel that she meets, armored or unarmored, can escape from her." She and her sister ship, the Minneapolis, are of 7,375 tons displacement, 412 feet long, 58 ft. 2½ in. beam, and 22 ft. 6½ in. draught. The Columbia is expected to maintain at sea a speed of 21 knots an hour. There are three screw propellers, one placed amidships as in ordinary single-screw ships, and one on each side, slightly forward of the middle screw. Each screw has a separate triple-expansion engine in an independent water-tight compartment. All the motive machinery and boilers are below the armored deck, which is 4 ft. 6 in. below the water-line at the sides and 1 foot above amidships; the slopes are 4 inches thick, and the flat 2½ inches. There is a cellular structure 5 feet wide extending the whole length of the ship at the outer edge of the protective deck. The coal carried at the designed draught is 750 tons, and the total capacity of the bunkers is 2,000 tons. The battery of this vessel is a light one, being only intended to cope with small cruisers and armed merchantmen; it consists of two 40-caliber 6-inch guns mounted in the open on the spar deck forward, one 8-inch gun aft, eight 4-inch rapid-firing guns in 4-inch steel sponsons on the main deck, and eighteen machine-guns of various sizes.

*Growth of the U. S. Navy.*—The navy of the U. S. began modern construction in 1883 by the building of the cruisers Chicago, Boston, and Atlanta, and the dispatch-boat Dolphin. During the period of the building and completion of these ships it became necessary also to establish in the U. S. the manufacture of the class of steel of which such vessels were built, and the construction of modern ordnance and ammunition. At this time twenty-five years had elapsed since the construction of powerful modern iron-

clads was begun abroad, and during the greater part of that period, since the close of the civil war, none of the new types of war-vessels had been built in the U. S., and the republic was absolutely without rank as a naval power. In effective force the navy was in 1886 rated as nineteenth among the nations. Thus the U. S. followed Japan, Turkey,

## Austria-Hungary.

FRANCIS T. BOWLEN.

**Ship-worm**: any bivalve of the family TEREDINIDÆ (q. v.).**Shipwreck** (in law): See WRECK.

**Shiras, GEORGE, JR., LL. D.**: justice U. S. Supreme Court: b. at Pittsburg, Pa., Jan. 26, 1832; educated at Ohio University, at Yale College, where he graduated 1853, and at Yale Law School; admitted to the bar at Pittsburg and practiced in that city; appointed associate justice of the Supreme Court of the U. S. July 19, 1892. The degree of LL. D. was conferred upon him by Yale University in 1883. C. H. T.

**Shiraz, shee'raaz, or Sheeraz**: town; capital of the province of Fars, in Persia; in lat. 29° 36' N. and lon. 52° 44' E. (see map of Persia and Arabia, ref. 4-H); situated at an elevation of 4,500 feet above the sea, in a valley made familiar by Moore's *Lalla Rookh*, and still celebrated for the abundance and excellence of its fruits of every description. Founded in 697, it was during more than five centuries a favorite residence of the Persian princes, and a seat of science and art. Sa'di and Hafiz were born, lived, and died here. Shiraz contains the tomb of Hafiz, and that of Sa'di is a few miles to the N. E. The city suffered fearfully from earthquake in 1812 and again in 1824. Rebuilt, it was almost destroyed by another earthquake 1853. It was again rebuilt, but on a less extended scale. Its manufactures and trade have greatly declined, but its wine, rose-water, carpets, and inlaid work are still famous in the East. Pop. about 25,000. E. A. GROSVENOR.

**Shire**: See COUNTY.

**Shiré, shee'ra**: river of Southeastern Africa, issuing from the Lake of Nyassa, in lat. 14° 28' S. It flows with many rapids and cataracts from the elevated plateau of the interior into the flat coastland, where it forms a broad, calm stream, navigable for the largest vessels, and joins the Zambezi about 90 miles above its mouth.

**Shirlaw, WALTER**: genre-painter; b. at Paisley, Scotland, Aug. 6, 1838. His parents removed to the U. S. in 1840, and in time he became a bank-note engraver; in 1870 he went to Munich, where he was a pupil of Raab, Wagner, Ramberg, and Lindenschmidt; became a National Academician 1888. His *Sheep-shearing—Bavarian Highlands* (1876), exhibited in 1877 at the National Academy, New York, attracted much attention. As an illustrator his designs for Goldsmith's *Hermit* are notable. Studio in New York. W. A. C.

**Shirley, JAMES**: dramatist; b. in London, Sept. 13, 1596; educated at Merchant Taylors' School, St. John's College, Oxford, and Catharine Hall, Cambridge; took orders in the Church of England, and obtained a curacy in Hertfordshire, but soon vacated it by becoming a Roman Catholic; taught for some time a grammar school at St. Albans, but, being unsuccessful, became a dramatic writer in London; had produced thirty-nine plays before the Great Rebellion; founded a classical academy at Whitefriars, and wrote several grammatical treatises. D. in London from exposure

consequent upon the great fire of 1666, and was buried Oct. 29. His *Dramatic Works and Poems* (6 vols., 1833) were first edited by Gifford and Dyce. He is regarded as the last of the Elizabethan dramatists. *The Traitor* (1631) is, by common consent, his best tragedy, and *The Lady of Pleasure* (1635) his best comedy. Revised by H. A. BEERS.

**Shirley, WILLIAM**: colonial governor of Massachusetts: b. at Preston, Sussex, England, in 1693; became a lawyer; settled in Boston, Mass., 1734; was commissioner for fixing the boundary-line between Massachusetts and Rhode Island; was royal governor of Massachusetts 1741-45; planned the successful expedition against Cape Breton 1745; was in England 1745-53; returned to Massachusetts as governor in the latter year; treated with the Eastern Indians 1754; explored Kennebec river, erecting there several forts; was commander-in-chief of the forces in British North America at the outbreak of the French war 1755; planned the expedition of Gen. Prideaux against Niagara, and proceeded himself as far as Oswego; was appointed lieutenant-general 1759; became afterward governor of the Bahama islands, but returned to Massachusetts, where he built a fine residence at Roxbury. D. at Roxbury, Mar. 24, 1771. Author of *Electra*, a tragedy; *The Birth of Hercules*, a masque; *A Letter to the Duke of Newcastle, with a Journal of the Siege of Louisbourg* (1745); and *The Conduct of Gen. William Shirley briefly Stated* (1758).—His son WILLIAM, an officer in the army, was killed at Braddock's defeat 1755.—Another son, Sir THOMAS, b. in Boston, became a major-general in the British army, was created a baronet 1786, and was governor of the Leeward islands. D. Mar., 1800.

**Shir'wa**: lake; a little S. E. of Lake Nyassa, Southeast Africa; formerly supposed to have as its outlet the Lujenda river, but discovered (1887) to be nothing more than a huge evaporating-pan with an area of about 350 sq. miles, into which a number of small rivers discharge. Its waters are brackish, are gradually drying up, and there is evidence that formerly the lake stood at a much higher level and discharged into the Lujenda river. C. C. A.

**Shi'shak**: the Hebrew name of the Egyptian king *Shashank*, first ruler of the twenty-second (Bubastite) dynasty (966-800 B. C.). He was probably of Libyan lineage, and at the close of the twenty-first (priestly) dynasty grasped the royal power which he had actually wielded previously. This was largely due to the increased influence of the Libyan mercenaries from whom the Egyptian army had been recruited since the time of Seti I. and Ramses II. The dominion of Egypt was much extended by Shishak, who waged war in Palestine against Rehoboam, King of Judah. His inscriptions on the south wall of the Temple of Amen at Karnak contain the names of 128 cities or regions in Palestine and Syria which fell into his hands. The list is really larger, but a considerable number of names are no longer legible. Jerusalem was among the captured places.

other important invention is that of a machine for sewing soles, which was improved by Gordon McKay. One of these machines in the hands of a good operator will easily sew on the soles of 800 pairs of women's shoes in ten hours. Originally, shoes made by the McKay process were not so well finished as to the inner part of the sole where the stitches came through, but this defect was overcome by the use of a smooth inner sole, cemented to the sole in such a way as entirely to cover the stitches. A later and more important invention is that of the Goodyear welt machine, as it is called, which has enabled manufacturers of shoes to produce footwear so closely resembling hand-work in appearance and durability as to render it extremely difficult to distinguish one from the other. Indeed in the best grades what difference exists may be fairly said to be in favor of the machine-sewed goods. A great part of the boots and shoes used in the U. S., especially the finer kinds, are made in large establishments in New York, Philadelphia, Baltimore, and other large cities, but more in several towns in Massachusetts, Maine, and New Hampshire; Lynn, Mass., is the greatest seat of this manufacture, and among the other large centers are Haverhill, Brockton, Milford, Marblehead, Worcester, Braintree, and Danvers, in Massachusetts; Portland, Augusta, and Lewiston, in Maine; Dover and Farmington, in New Hampshire. Until about 1890 the U. S. did but little export business in boots and shoes.

Revised by VAUGHAN SNIDER.

**Shoebill:** a large wading bird (*Baleniceps rex*) inhabiting the region of the White Nile, Africa. It is named from its large, peculiarly shaped beak, and is also termed whale-headed stork, although its affinities are rather with the herons. It stands nearly 5 feet high, is gray, and has a little recurved crest. F. A. L.

Shoebill.

**Shoebury:** a promontory in the county of Essex, England; on the northern shore of the estuary of the Thames, directly opposite Sheerness (see map of England, ref. 12-L). Shoebury was selected by the Government as the locality of experimental firing at armored targets and for trial of new guns. It is the seat of a school of gunnery, with artillery, barracks, batteries, targets, etc.

**Shoeing of Horses:** See FARRIERY.

**Shōgun** (Jap., liter., general, the Chinese *Tsiang-Kiun*): a Japanese military title, said to have been first employed by the Emperor Sujin in the first century B. C., when he divided the empire into four military divisions. The name began to have a political significance with Yoritomo (q. v.), who was appointed in 1192 *Sei-i-tai-Shogun*, or generalissimo, against the barbarians. Henceforward the shogunate more and more represented the real governing force in the empire, until in the seventeenth century the Tokugawas (see IYAYASU) became a real reigning dynasty. The empire was centralized afresh from Yedo, so that in 1868 when the emperor resumed power he merely fell heir to the bureaucratic system developed by these rulers. J. M. DIXON.

**Sholapur:** district and city in the southern part of the Bombay Presidency, British India; on the border of Haidarabad. The district lies between the parallels 17° 13' and 18° 35' N.; has an area of 4,521 sq. miles; is bleak and treeless, and generally flat or slightly undulating, and is subject to great irregularity in the amount of rainfall, making agriculture dependent on irrigation. Its silks, finer cotton cloths, and blankets have a good name, and the chief exports besides cloths are oil, oil-seeds, ghee, and turmeric. The population numbers about 600,000, mostly Hindus. The city of Sholapur, chief town and administrative headquarters of the district, is in lat. 17° 40' N., lon. 75° 57' E., near the Sina river (see map of S. India, ref. 4-D). It is a station on the Great Indian Peninsular Railway. It is one of the principal cotton-markets of the Dekkan. Pop. (1891) 61,915.

MARK W. HARRINGTON.

**Sho'mer, Shammer, or Jebel Shomer:** a territory, part of the great central plateau of Arabia; bounded N. by the Syrian desert, from which it is separated by mountains

9,000 feet high, N. E. by Irak Arabi, S. by the sultanate of the Wahabees, and W. by Turkish Arabia. The Arabs here have always remained in a savage condition, little influenced by the rise of the Mussulman empire. About the end of the eighteenth century they came under the power of the Wahabees, but since the overthrow of the latter have been independent. The country is divided into five provinces, said to contain eighty-six towns and villages, the chief of which is Hayel. Between it and Medina considerable trade is carried on. Corn and fruit are raised by artificial irrigation. Dates, cotton, horses, and asses are exported. Pop. of territory estimated at 450,000. E. A. G.

**Shooting Stars:** See METEORS.

**Shore:** See COAST.

**Shore, JANE:** mistress of Edward IV.; b. in London, England, about 1445; married a rich London goldsmith named Matthew or William Shore; became mistress of King Edward IV. about 1470, and of Lord Hastings after the death of the former, 1483. She was accused of witchcraft as an accomplice of Hastings, who was beheaded for that pretended crime, though the real reason for the proceedings against them was their known partiality to the cause of the young princes. According to More's account, Jane Shore was charged by King Richard III. with having withered his arm by her arts of sorcery; was committed to the Tower and her property confiscated; was never brought to trial, but was compelled by the Bishop of London to do public penance for impiety and adultery. The king's solicitor, Thomas Lynon, desired to marry her after the death of Hastings, but Richard tried to dissuade him, and whether the marriage took place is not known. She survived until after the accession of Henry VIII., and popular legend represented her as having died of hunger in a ditch—a version which long retained currency through the famous drama of Rowe bearing her name; but the legend was probably derived from the name of a London locality still called Shoreditch. Sir Thomas More bears emphatic testimony to her beauty, kindness, and wit.

**Shore, Sir JOHN:** See TEIGNMOUTH, BARON.

**Short, CHARLES, LL. D.:** educator; b. at Haverhill, Mass., May 28, 1821; received his early education at Bradford Academy and Phillips Andover Academy; graduated at Harvard 1846; classical instructor in Roxbury and Philadelphia 1847-63; president of Kenyon College, O., and Professor of Intellectual and Moral Philosophy 1863-67. On the death of Dr. Anthon, Professor of Greek in Columbia College, New York, Dr. Henry Drisler was transferred to the Greek chair, and Dr. Short succeeded Dr. Drisler as Professor of Latin in 1868. He edited, with additions, *Advanced Latin Exercises* in Schmitz and Zumpt's Latin Series (1860); revised Mitchell's *New Ancient Geography*; wrote an elaborate essay on the *Order of Words in Greek*, prefixed to Dr. Drisler's edition of Yonge's *English-Greek Lexicon* (1870); and, with Charlton T. Lewis, revised (1879) Andrews's *Freund's Latin Dictionary*. He contributed many articles, mostly critical, to reviews and other periodicals, chiefly to the *Bibliotheca Sacra*. He was from the outset a member of the American committee co-operating with the British committee in the revision of the English Bible. D. in New York, Dec. 24, 1886.

Revised by BENJ. IDE WHEELER.

**Short, WILLIAM:** diplomatist; b. at Spring Garden, Va., Sept. 30, 1759; studied at William and Mary College; was at an early age a member of the executive council of Virginia; accompanied Thomas Jefferson on his embassy to France as secretary of legation 1784; was appointed *chargé d'affaires* to France by Washington 1789 (being the first commission signed by him as President), and was subsequently minister to the Netherlands and to Spain, where in 1795 he concluded the negotiations which resulted in the treaty of friendship, commerce, and boundaries. D. in Philadelphia, Pa., Dec. 5, 1849.

**Shorthand:** See PHONOGRAPHY and STENOGRAPHY.

**Shorthorns:** a breed of beef-cattle which originated in the valley of the river Tees, between the counties of Durham and York, in England. They are often called Durham, shorthorned Durham, and Teeswater cattle. Since very early times the cattle of the northeastern coast of England have differed in type from those of other parts of Great Britain, and there are many reasons for believing that this is due to an admixture of the blood of the cattle of the adjacent countries of continental Europe, brought over at the time

**Unkagarits**—inhabiting the northwestern part of Utah, west of Utah and Great Salt lakes, and a strip in Eastern Nevada. They were one of the few Shoshonean divisions engaging in agriculture, and were scattered over the country as the springs and watercourses afforded arable land. According to some authorities the Gosiute are a mixture of Shoshoni and Ute. There seems to be no aboriginal name of the confederacy—a fact indicating very recent organization as such. Pop. (1890) 256.

**Paiute**.—The generally accepted idea is that the term originated from *pah*, water, and Ute, hence "water Ute"; more likely it is derived from *pai*, true, and Ute, thus signifying "true Ute." The name has been applied at various times to most of the Shoshonean tribes of Eastern Utah, Northern Arizona, Southern Idaho, Eastern Oregon, Nevada, and Eastern and Southern California, whereas it properly belongs exclusively to the Corn creek tribe of Southwestern Utah. Paiute, however, is a convenient divisional name for the tribes occupying the southwestern part of Utah, Central Nevada, and Northern Arizona, and including the Chemehuevi of Colorado river. Under it are also included the tribes of Southeastern California from the neighborhood of Owens valley along the eastern slopes of the sierras, and to the S. of Tulare Lake and E. of the Coast Range. The principal Paiute tribes are: Chemehuevi or Tantawats, formerly about the great bend of Colorado river and now attached to the Colorado river agency—population about 200; Kwaiantik-wokets, formerly E. of Colorado river, in Arizona, where they affiliated largely with the Navajo, and numbered 62 in 1874; Shivwits and Uinkarets in Northern Arizona—population 182 and 40, respectively, in 1874. There are 19 insignificant tribes or bands in California, among them the Mono (a term collectively applied), Keats, and Moquats; 17 in Nevada, and 8 in Utah (including the Kaivawits and Unkakaniguts). The Paiute population approximates 2,500, there being in Utah 500, Northern Arizona 500, Southern Nevada 1,000, and Southeastern California 500.

**Panamint**.—This division is linguistically related more closely to the Shoshoni than to any other of the tribes of the stock, and it is not improbable that they became detached from that body through the intrusion of the Gosiute, and gradually drifted to their later habitat in and around Panamint and Death valleys, between lat. 36° and 37°, Eastern California. A few individuals live in the mining town of Darwin, while about 150 are scattered in the desert country to the E. of Panamint valley.

**Paviotso** (strong, able).—These Indians form a confederacy of twenty-eight insignificant tribes, chiefly in Western Nevada, but extending into Oregon as far north as Lakes Harney and Malheur, and westward to about Warner Lake near the southern boundary, and Camp Bidwell in Northeastern California. The shores of Honey Lake in Eastern California were also occupied by them. In the east they extended to the Shoshoni territory in lon. 117° 30'. Their lowermost settlements were in Owens valley, Eastern California. Like many other tribes of this region, the Paviotso were early confounded with the Paiute, whom they closely resemble. Their extension north into the Pyramid Lake region of Western Nevada and into Oregon has been comparatively recent, having after a long conflict displaced the Saitika. They probably number about 4,000.

**Shoshoni**.—This is the most northerly division, and formerly occupied Wyoming, the entire central and southern parts of Idaho, except the area occupied by the Bannock, a small part of Eastern Oregon, Eastern and Central Nevada, and a small strip of Utah W. of Great Salt Lake. The Snake river country in Idaho is perhaps to be considered their chief seat, whence they are also called Snake Indians. In 1803 Lewis and Clark found the northern bands of the Shoshoni on the head-waters of the Missouri in Montana, but they had earlier ranged farther east on the plains, whence they had been driven into the Rocky Mountains by the hostile Atsina and Blackfeet, who early obtained firearms.

The more northerly and eastern Shoshoni were horse and buffalo Indians, and in character and warlike prowess compared favorably with most western tribes. Those of Snake river and to the south in Nevada represented a lower type, since most of this country was barren and comparatively devoid of large game. They depended for food to a large extent upon fish, supplemented by rabbits, roots, nuts, and seeds. The Shoshoni, more commonly than any others of the Shoshonean tribes, were called Diggers and Shoshokos (walkers). None of them were agriculturists. In general, the style of their habitations corresponded to the two types

of Shoshoni. In the north and east they lived in pole and skin lodges, but in the sage country to the west brush shelters were used, some of them in the Snake river region being mere roofless semicircles that afforded little protection against the wind and snow. There were many dialects corresponding to the degree of isolation of the several tribes, but mutually intelligible. The most important of the original divisions or bands of the Shoshoni are the Tukuarika or Sheep-eaters, Tussawehe, and Wihinash. They have materially decreased in numbers; those surviving are in Nevada: on Fort Hall and Lemhi reservations, Idaho (pop. 948 and 357 respectively); western Shoshoni reservation, Nevada (pop. 367), and the Shoshoni reservation, Wyoming (pop. 883). Their entire number approximates 5,000.

**Tobikhar**.—This term, meaning settlers, belongs strictly to a group of small tribes formerly about San Gabriel mission and Los Angeles, Southern California, but has been adopted as a group name to include the Shoshonean tribes who spoke related dialects, and lived about the missions of San Luis Rey, San Juan Capistrano, San Fernando, Los Angeles, San Bernardino, and San Gabriel. These formed the southwestern or coast division of the stock, and their remnants compose the bulk of the so-called Mission Indians, which embrace also a few representatives of the Yuman stock. The status of the Indians of this group and their relation to the State government have never been fully defined. They appear not to have been agriculturists prior to the mission period; hence upon the disestablishment of the missions some of the Indians returned to their primitive mode of life, while others practiced the rude arts of agriculture learned under mission sway. Notwithstanding their docile and submissive character the Tobikhar, like most of the Shoshonean tribes, were doubtless once of a more aggressive and warlike disposition, and were able to force their way to the coast through the Chumashan and Mariposan tribes on the north, and those of Yuman stock on the south. The population is about 2,200.

**Tusayan** (probably from the Navajo *Zilh-Tásdun*, signifying country of the isolated buttes).—The so-called province of Tusayan comprises seven pueblos on the summits of four mesas in Northeastern Arizona, about 50 miles E. of the Rio Colorado Chiquito, and about the same distance S. of the Rio San Juan. The pueblos constitute three groups: Walpi, Sichumovi, and Hano or Tewa in one; Mashongnovi, Shumopovi, and Shupaulovi the second, 7 miles westward; Oraibi the third, 8 miles still farther west. Six of these villages are inhabited by the Hopi (signifying "people," but improperly called by the opprobrious Zuni term Moki), the seventh pueblo, Hano, being occupied by a division of the Tewa tribe, of Tanoan stock, who left their kindred on the Rio Grande about 1680, and settled at Tusayan, where they maintain their distinctness. The Hopi afford the only instance of tribes of the predatory Shoshonean stock who have adopted a strictly pueblo life. Tusayan was known to the earliest Spanish explorers of the Southwest. Marcos of Niza in 1539 spoke of it under the name Totontec. It was first visited by whites in 1540, when Tobar and Padilla, and afterward Cardenas, of Coronado's army reached the so-called province from Zuni. Expeditions to Tusayan were also made by Espejo in 1583 and Oñate in 1598. Missions were established at the now ruined pueblos of Awatobi and at Mashongnovi and Shumopovi at an early date, but were abandoned upon the murder of the missionaries and destruction of the churches during the Pueblo revolt of 1680. Tusayan tradition seems to indicate that the present Hopi villages are a confederacy of phratries, or perhaps independent groups, who, after various wanderings, settled in one place. The union is not a close one, and tradition points to feuds and even to bitter wars between the towns, during one of which Awatobi (once the principal pueblo) was totally destroyed. Like the other Pueblo tribes, the Hopi have been agriculturists since first known to history. They early acquired possession of sheep, and are expert weavers, potters, and basket-makers. The estimates of population given by the early explorers are greatly exaggerated. They number about 1,750.

**Ute**.—This division formerly occupied the central and western portions of Colorado and Southeastern Utah, including the eastern part of Salt Lake valley and Utah valley. They extended also into New Mexico, occupying much of the drainage area of the Rio San Juan. None of the Ute were agriculturists, but they appear to have been always a warlike people, and their early possession of horses intensified their aggressive character. The various divisions or

**Stratford-upon-Avon** (late *Avonport*): capital of Stratford-upon-Avon, England, on the Severn, which is crossed here by three bridges, 42 miles W. by N. of Birmingham and 101 N. W. of London (see map of England, and B.C.). It is an old and picturesque town, though the streets are steep and narrow. The Norman castle still remains, and of the sixteenth-century the Church of the Holy Cross. St. Mary's church, a romantic building with a tower and spire, was founded in the thirteenth century. Among other buildings are the marketplace (1598), the theatre, rebuilt in 1851, and the town hall itself (1868). Stratford-upon-Avon, founded in 1201 as one of the seven great public schools of England, and has a rich environment. Near here on May 21, 1616, died W.

defeated Hotspur, and in 1644 the town was besieged by the parliamentary army. Shrewsbury sends one member to Parliament. Pop. (1891) 26,967.

**Shrike** [O. Eng. *scric*, thrush, (perhaps also) shrike: Icel. *shrikja*, shrike, liter., shrieker; cf. Eng. *shriek*]: any one of the *Laniidae*, a family of passerine birds. The best known North American species is the butcher-bird (*Lanius borealis*). They are noted for their habit of impaling insects and small birds upon the points of thorns.

**Shrimp** [cf. *shrimp*, another form of *scrimp*]: a name properly restricted to crustaceans of the genus *Crangon*, but

The shrimp.

more usually applied to any of the smaller long-tailed crustaceans. The common shrimp of Great Britain, *C. vulgaris*, is esteemed a delicacy as food.

**Shropshire**, or **Salop**: a west midland county of England; on both sides of the Severn, and bounded W. by Wales. Area, 1,319 sq. miles. The northern part is level, with the exception of the Wrekin (1,320 feet), and is chiefly under tillage; the southern is hilly, reaching 1,800 feet in the Cleve Hills, and mainly devoted to cattle-breeding. The county has a fine breed of sheep. There is a considerable production of coal and some of iron, limestone, and freestone. Pop. (1891) 236,324.

**Shrove-Tuesday** [from *shrive*, to confess sin]: the day preceding Ash-Wednesday, so called from the old custom of confessing and receiving shrift on that day as a preparation for the forty days' fast. It is in general a day of pleasure in most Roman Catholic countries. It is the Carnival of the Italians, the Mardi Gras of the French, and the Pancake-Tuesday of former days in England.

**Shu'brick**, WILLIAM BRANFORD: rear-admiral U. S. navy; b. on Bull's island, South Carolina, Oct. 31, 1790; entered Harvard in 1805, but was appointed midshipman June, 1806. He became lieutenant Jan., 1813; commanded a gunboat in Hampton roads in 1813, and assisted in the defense of Norfolk and the navy-yard at Gosport; in 1813 was transferred to the Constitution, and made two cruises, aiding in the capture of three ships of war, including the *Cyane* and the *Levant*; was awarded a sword by his native State and a medal by Congress; was promoted to the rank of commander 1820, and served at the navy-yards at Charlestown, Mass., and New York until Apr., 1826, when he was appointed to the command of the *Lexington*; in 1831 was commissioned captain; commanded the West India squadron 1838-40; was in command of the navy-yard at Norfolk, Va., Oct., 1840-Oct., 1843; chief of the bureau of provisions and clothing for the navy 1845-46; was appointed to command the Pacific squadron July, 1846, and during the war with Mexico captured several ports; was appointed to the lighthouse board Sept., 1852; placed in command of the eastern coast squadron for the protection of American fishermen July, 1853, and in September returned to Washington and resumed his duties as chairman of the lighthouse board; appointed president of board to prepare regulations for the navy Aug., 1857; commanded the Brazil squadron and Paraguay expedition 1858-59, returning to resume duty as chairman of the lighthouse board; was retired in 1861, but continued a member of the advisory board until 1870; was commissioned rear-admiral in 1862. D. in Washington, D. C., May 27, 1874.

**Shu'feldt**, ROBERT W.: rear-admiral U. S. navy; b. in Red Hook, N. Y., Feb. 21, 1822; entered the navy as a midshipman May 11, 1839; commanded several vessels on the coast during the civil war, and was actively engaged against the defenses of Charleston; commanded the flag-ship of the East Indian squadron during 1865 and 1866, and that of the Mediterranean from 1871 to 1873; in 1875 appointed chief

of the bureau of equipment and recruiting. He was consul-general to Cuba during the first year of the civil war—a place of great importance, which he filled with admirable judgment and discretion. Retired Feb. 21, 1884.

**Shullsburg**: city; Lafayette co., Wis.; on the Ch. Mil. and St. P. Railway; 24 miles E. by N. of Dubuque, 60 miles S. W. of Madison (for location, see map of Wisconsin, ref. 7-C). It is in an agricultural and lead-mining region, and contains 4 churches, 3 hotels, a national bank with capital of \$50,000, a State bank with capital of \$50,000, and two weekly newspapers. Pop. (1880) 1,168; (1890) 1,393; (1895) estimated, 1,400.

EDITOR OF "PICK AND GAD."

**Shu'magin Islands**: small archipelago of Alaska, in lat. 55° N., lon. 160° W., just E. of the peninsula of Alaska, from which they are separated by Unga Straits, consisting of Unga, Nagai, Popoff, Korovin, Big Koniushi, Little Koniushi, Simeonoff, and many smaller islands and islets. Unga is about 10 miles long by 7 broad, and contains the only settlement of any size on the islands, viz., the little town of Unga near the southeast angle. Nagai is about 30 miles long by 4 broad, and of very irregular shape. The islands are generally mountainous, are without tree-growth, have abundant rainfall, and several excellent harbors. Good lignite has been found on Unga. Salmon abound in the streams in early summer, and good cod-banks are near by. These islands were discovered by Lieut. Waxel in 1741, and were given the name of one of his sailors buried there. Area about 600 sq. miles.

MARK W. HARRINGTON.

**Shumla**: town; in Bulgaria, half way between Rustchuk and Varna; in a fertile plain, inclosed on three sides by inaccessible spurs of the Balkans and strongly fortified (see map of Turkey, ref. 3-D). It is also an important commercial center and manufactures leather, copper ware, and cloth. Pop. (1893) 23,517.

E. A. G.

**Shur** [Heb., wall]: the name applied by the Hebrews to the desert which bordered Egypt on the E. of the southern half of the Isthmus of Suez (Ex. xv. 22). Some have derived the name from the wall, 1,500 stadia long, which is alleged by Diodorus (i., 57) to have been built by Sesostris from Pelusium to Heliopolis for the defense of Egypt against the eastern Bedouin. (Trumbull, *Kadesh Barnea*, pp. 44 ff.) An *anbu haq* (wall of the ruler) in this region certainly is mentioned in a papyrus of the twelfth dynasty, but it antedated Sesostris-Ramses by more than the whole Hyksos period. In most of the Old Testament passages *Shur* seems to have been the name of a place near Egypt (Gen. xvi. 7, xx. 1, xxv. 18; 1 Sam. xv. 7, xxvii. 8), and it has been conjectured that it corresponded with the Egyptian *Anbu* (wall, Gr. *Gerrhon*), which probably lay near the Mediterranean to the N. of the isthmus, and was a fortified place on one of the highways to the East (Strabo, *Geogr.*, xvi., 2, 23).

CHARLES R. GILLET.

**Shurtleff**, NATHANIEL BRADSTREET, M. D.: antiquary; b. in Boston, Mass., June 29, 1810; graduated at Harvard 1831, and at the Medical School 1834; became a physician in Boston; mayor of Boston 1868-70. He was the author of *An Epitome of Phrenology* (1835); *A Perpetual Calendar for Old and New Style* (1848); *Passengers of the Mayflower in 1620* (1849); *Notice of William Shurtleff of Marshfield* (1850); *Genealogy of the Leverett Family* (1850); and *A Topographical Description of Boston* (1871), besides many minor publications and contributions to *The Genealogical Register*. He was the editor of the series of *Records of the Governor and Company of Massachusetts Bay 1628-86* 6 vols. 4to, 1853-54, and, with David Pulsifer, of the equally important *Records of the Colony of New Plymouth* (12 vols. in 11, 4to, 1855-61). D. in Boston, Oct. 17, 1874.

**Shusha**: town of Elisabethpol, Asiatic Caucasus, Russia; lat. 39° 46' N., lon. 46° 25' E.; formerly a fortress, on an isolated rocky hill, inaccessible on three sides; celebrated for its silk-culture, carpets, and horses; 70 miles S. by E. of the city of Elisabethpol (see map of Russia, ref. 12-G). The climate is rigorous. This place was formerly capital of the khanate of Karabagh, annexed by Russia in 1822. Pop. (1891) 26,806.

M. W. H.

**Shuvaloff**: another form of the name SCHUVALOV (q. v.).

**Sialagogues** [Gr. *σάλαιον*, saliva + *ἀγωγός*, leading, deriv. of *ἄγω*, lead]: drugs that cause an increased secretion of saliva. Mercury has this property more than any other substance, but as the increased salivary flow is simply one among many effects of a poisonous dose of the drug, the term sialagogue is not a proper definitive appellation.

European arts, sciences, and languages are taught, and for many years it has been the custom to send a few young Siamese abroad for a technical education.

**Government.**—The throne is hereditary, but the king may choose his successor in his own family. The legislative power is in the hands of the king, assisted by a council of ministers. The tributary states are ruled sometimes by their own princes, sometimes by a royal commissioner, and there is a strong tendency toward increased centralization. The kingdom proper is divided into forty-one districts under royal governors. The king's annual revenue is estimated at \$10,000,000, produced by a land-tax, customs, taxes on opium, spirits, tin mines, fruit-trees, edible birds'-nests, fisheries (in the order of the amount of revenue from each), and other sources. All taxes, except customs, are farmed. There is no public debt. The standing army consists of 12,000 men, well supplied with arms and artillery, is largely officered by Europeans, and is said to be in a very effective condition. All males of suitable years are subject to military duty. The Government has a small navy, and the mouth of the Menam is fortified at Paknam.

**Commerce.**—Bangkok, the capital, is also the commercial center and chief port. In 1898 the imports were valued at \$11,295,390 and the exports at \$22,285,570. About one-fourth of the imports in value was cotton goods, and of the exports five-sevenths consisted of rice. Other exports were teak, pepper, salt and dried fish, and bullocks and hides. Both imports and exports are chiefly exchanged with Hongkong and Singapore, and there is a considerable trade to the northward to the Shan states and Yunnan. In 1892 292 vessels (248 of them British) entered Bangkok, and 288 vessels (242 British) cleared from that port. A railway, 14 miles long, connecting Paknam, at the mouth of the river, with Bangkok was opened in 1893. A railway from Bangkok to Korat, 165 miles N. E., is under construction, and many others have been projected. Bangkok has an electric tramway in operation. Telegraph lines, with a total length of 1,780 miles, connect Bangkok with Chiangmai, Chantabun, and other Siamese cities; also with Saigon in Tonquin and Maulmein in Burma. There is a postal service with 98 stations outside of Bangkok (1890), and Siam belongs to the International Postal Union. In 1890 189,970 domestic and 219,170 foreign letters were handled. The unit of money is the *tical*, a silver coin worth forty-one cents in average exchange. Silver and bronze are coined in fractions of the *tical*, and paper money is current in multiples of this coin. The unit of weight is the *chang* (2½ lb., avoirdupois); and of length, the *niu* (1½ English inches) or the *wah* (48 niu = 80 inches).

**History.**—The Siamese apparently came from the north and first appear in history in 575 A. D., when they founded Labong, about lat. 18° N., in the Upper Menam valley. The date of introduction of Buddhism among them is put at 638 A. D. They pressed steadily southward as invaders until in the thirteenth century they had reached the gulf and peninsula, and had apparently more territory than they have now. In 1350 they made Ayuthia the capital, and it so continued until 1782, when the Government removed to Bangkok, where it remains. For many centuries they carried on wars with their neighbors, the Burmese, Peguans, Cambodians, and with the people they displaced, with varying fortune but final success. The Burmese twice took their capital (1555 and 1767), the second time only after a two years' siege. In 1592 Siam entered into close diplomatic and commercial relations with Japan, and many Japanese settled in the country, where they played the part now taken there by Europeans, but native jealousy finally resulted in their expulsion with violence in 1632. Very similar is the history of their relations with France, begun in 1684. The present dynasty succeeded a Chinese one, and began with the removal of the capital to Bangkok (1782). The conquests of Shans and Laos have been chiefly under this dynasty. The last three kings have made especial effort to extend the relations of Siam with the Western world. Maha Mongkut (1852 to 1868), the immediate predecessor of the present king, was a man of great learning and enterprise, and the present king, Chulalongkorn, continues his broad-minded policy. Siam is, however, weak, and wedged in as she is between British and French possessions, owes her continued existence to suzerainty on their part. In 1893 France possessed herself of Siam's territories across the Mekong, and in 1895 negotiations were in progress between France and Great Britain to form a buffer state between Siam and China, Tonquin and Burma.

**REFERENCES.**—The classical work on Siam is that of Mgr. Pallegoix, *Description du royaume Thaï ou Siam* (2 vols., 1854). See also Bowring, *The Kingdom and People of Siam* (2 vols., 1857); Mouhot, *Travels in the Central Parts of Indo-China, etc.* (2 vols., 1864, translated from the *Tour du Monde*); Vincent, *Land of the White Elephant* (1874; new ed. 1889); Leonowens, *An English Governess at the Siamese Court* (1870); Bock, *Temples and Elephants* (1884); Colquhoun, *Among the Shans* (1885). **Siamese Twins:** See ENG AND CHANG.

**Siberia** [from Russ. *Sibir*, Siberia, a word perhaps of Tartar origin from *Saibir*, the name of the seat of the Tartar rulers on the Irtysh]: a territory in Northern Asia, belonging to Russia. It is bounded on the N. by the Arctic Ocean from the mouth of the Kara river on the W. to Bering Straits; on the E. by Bering Sea, the Sea of Okhotsk, the Tartar Channel, and the Sea of Japan S. to the mouth of the Tumen-kiang on the Korean frontier; on the S. by Korea, Manchuria, Mongolia, and the Russian provinces Semipalatinsk, Akmolinsk, and Turgai of the steppes; on the W. by the upper Ural river, the Ural Mountains, and the Kara river. It includes portions of the governments of Orenberg and Perm usually classed as European. Thus limited Siberia has an area of 4,925,000 sq. miles, and a population of about 6,000,000. It is about a quarter larger than all Europe, but has only the population of Belgium.

**Political Divisions.**—Politically, Siberia includes Saghalien with the above, but excludes Orenburg and Perm, giving an area of 4,833,496 sq. miles, and a population, according to official estimates from 1889 to 1892, generally for 1890, of 4,538,561, or a little less than one per square mile. In this territory are the governments of Tobolsk and Tomsk, formerly composing the government of Western Siberia, but now directly administered under the Russian Minister of the Interior; the governments of Yeniseisk and Irkutsk, and the province of Yakutsk, formerly composing the general government of Eastern Siberia, now called the general government of Irkutsk; the provinces of Transbaikalia, and of the Amur, the Coast Province or Primorskaia Oblast, and the circle of Saghalien, forming the general government of the Amur. For details as to these governments and provinces, see each under its own heading.

**Configuration.**—The Ural Mountains, which separate Siberia from European Russia, reach an elevation of only 5,522 feet at their culminating point at Mt. Konchakof in the government of Perm. They can be traversed without difficulty, and their slopes are especially gentle on the Asiatic side. These mountains aside, Siberia has a very simple structure, consisting of an elevated plateau in the southeast, set in mountains, and passing toward the W. and N. by an enormous plain. The plateau is called the plateau of Vitim, from the branch of the Lena which takes its rise there. It is the northward extension of the great plateau of Asia, which has its highest and broadest part abutting the Himalaya Mountains and extends nearly to Bering Straits. In Siberia it is narrow and relatively low, rarely surpassing 3,000 feet. In this plateau all the great rivers of Siberia take their rise. The margins consist of a series of mountain ranges with relatively gentle slope where they abut on it, and abrupt descents toward the plain or sea. On the sea of Okhotsk the mountains rise abruptly from the water, and there is an outlying range in Kamchatka. In the Amur region plains of considerable magnitude intervene between the ranges at the eastern margin of the plateau and the coast ranges, which extend from Korea to the mouth of the Amur. The termination of the plateau toward the N. E. is in a region very imperfectly explored. The area so far described includes only about one-fourth of Siberia. The remainder consists of an enormous plain extending W., N. W., and N., and sloping N. and W., with an ill-defined intermediate hilly region. This is the great plain of Asia, and is continued beyond the Urals in the plain of Russia and Germany. In Asia it consists southwestward of steppes, grassy and sandy, which rise very gradually to the low, rounded, imperceptible watershed between the Arctic and Turkestan systems of drainage. Its slope northward is rapid near the mountains, thence growing more and more gradual. The steppes pass gradually into the tundras of the north, which extend to the Arctic Ocean along the entire northern boundary. They are level or rolling plains, subarctic and arctic in character, with an alluvial soil. They are of a depressing sameness, are well-watered, and would be suitable for cultivation did the climate permit. Their

**Russia.** The Siberian forests are sometimes dense and continuous, but they are more often open, with intervening prairies. The oaks, lindens, and maples are found only on the Pacific versant, and here they are of unfamiliar species. The common fruits—the apple, pear, cherry, gooseberry—do not flourish in Siberia, but the hop is very common. The northern limit of cereals is about 60° N. lat. in the basin of the Obi, and rises to 61° or 62° in Yakutsk and the Aldan basin, but descends to 54° N. on the Sea of Okhotsk and in Kamchatka. They do not flourish on the elevated plateaus.

The fauna is not unlike the European, except in the southwest, where it is like that of Turkestan, and the southeast, where it is closely allied to the Manchurian. The northern shores have the reindeer, the northern hare, two species of fox and a wild dog, two species of lemmings, and the Siberian bear, the last becoming more and more rare. The mammoth and a rhinoceros abounded in these plains apparently at a time antedating the Glacial epoch. Farther S. animal life is abundant, and even the tiger penetrates into the Amur valley. Lake Baikal, though a body of fresh water, has its own species of seal, and the waters, both running and standing, abound in fish. Among the domesticated animals is the reindeer, which here descends to lat. 50° N. on the mountains bordering on Mongolia, where its habitat touches that of the camel. Siberia offers abundant pasturage, and is especially suited to the raising of live stock. According to recent estimates, it possessed over 2,000,000 each of horses and horned cattle, nearly 3,000,000 sheep, 500,000 swine, 200,000 goats, 146,000 domesticated reindeer, and 3,600 camels. The collection of furs (fox, ermine, marten, sable, bear, squirrel) forms an important industry.

**Agriculture.**—The amount of arable land is estimated at from one-third to one-fifth of the total area, more in proportion in Western than in Eastern Siberia. The maritime province, adjoining Manchuria and the Pacific, is more favorable for agriculture, so far as climate and water-supply are concerned, but it is little known. Agriculture is very primitive, but the virgin lands yield enormous crops. The chief crops are wheat (spring and winter), rye, oats, barley, the potato, and tobacco. There are few manufacturing industries. Trade is mostly with European Russia, but is very profitable, with high prices and high rates of interest.

**Population.**—The population is most dense over a long and slender triangle, whose base is on the Ural Mountains, and whose axis passes from Ekaterinburg to Vladivostok, through Lake Baikal. In this space the greater portion of the inhabitants are of European descent, mostly Russians, with a few Poles and still fewer Germans. N. of this area, and over three-fourths of Siberia, the population is very sparse, and consists of tribes of Finnish relationship in the west (Ostiaks, Samoyedes, etc.) and of uncertain relationships in the east (Chukchees, Koriaks, Kamchadales, etc., with a few Eskimos about Cape East). S. of the area above described are Turco-Tartars in the west (Kalmuks, etc.) and Mongols in the east (Buriats, Tunguses, etc.). The Buriats occupy much of the Amur valley, and the Tunguses extend northward into the Yenisei basin until their area adjoins that of the Samoyedes. There are also a few thousands of Jews and gypsies scattered through Siberia. The abundant archaeological remains show that Siberia has been occupied from the earliest times, and the peoples along the Arctic coast appear to be the ethnic remnants of the aborigines. Peoples of Turkish or Mongolian races in wave after wave have swept over the country and left remnants of their own tribes in its southern parts. The lot of the indigenes, whether aboriginal or not, is not pleasant. Oppressed by imposts of the nature of tribute, robbed of their lands most suited for the chase, fleeced by functionaries and merchants, exposed to new and destructive maladies, and demoralized by spirituous liquors, their number is decreasing rapidly.

The religions are as diverse as the peoples. The Russians are generally Orthodox, but many dissenters have been deported. The Poles are usually Roman Catholics, the Tartars Mohammedans, the Mongols Lama-Buddhists, and the northern indigenes pagans of the Shaman type. Missionary effort is active throughout the country, and especially in the west. Many of the indigenes profess Christianity.

The conquest of Siberia was begun in 1582. The latest addition to its territory was SAGHALIEN (q. v.) in 1875. From the beginning a stream of voluntary colonists has poured into Siberia from European Russia, although immigration was at times forbidden by the Government and is strictly regulated. The number of such colonists from 1860 to 1880 is officially estimated at about 100,000. In the latter part of

the eighties it had increased to about 35,000 per year, and since the Samara famine it has greatly increased and is estimated to have been 100,000 in 1892.

**Increase through Deportation.**—Deportation to Siberia was important in the seventeenth century, and adds annually about 20,000 to the population, of whom about one-fourth are voluntary, accompanying their families. From 1823 to 1869 there were over 600,000 persons deported to Siberia, and of them 167,000 were voluntary. About 15 per cent. of the deported were women; 12 per cent. were sentenced to hard labor, 20 per cent. to loss of civil rights, 13 without such loss, and 24 were free to change residence in Siberia; 52 per cent. were deported by executive act, or otherwise without process of courts. When deported they are sent to prisons at Tiumen and thence distributed, some to the extreme north, some to hard labor in mines in the Amur, some to the convict island of Saghalien, but generally to some less remote or less forbidding place where the chief reminder of their condition is the strict police surveillance to which they are subjected. The political exiles are the most intelligent and worthy, but the worst treated. The criminals sometimes become vagabonds, and may continue their unlawful careers. The exiles in Siberia make 5 per cent. of the population as a whole—1 in Yakutsk, 3 in Tomsk, 4 in Transbaikalia, 5 in Tobolsk, 10 in Yeniseisk and Irkutsk, and in Saghalien about 70.

**Vital Statistics, etc.**—Aside from the unfavorable conditions induced by the introduction of criminals by deportation, the social state of Europeans in Siberia is not bad. The birth-rate is very high (45.5 in 1890) and the death-rate somewhat high (31), but not so high as in European Russia. Only 9 per cent. of the population as a whole live in the towns. The number of females (1888) surpassed that of the males by 1 in 100. In 1891–92 there were 1,446 primary schools with 49,118 pupils, 55 middle schools with 7,401 pupils, 17 professional schools with 974 pupils (only 75 girls in the last), and a university at Tomsk, opened in 1887.

**Means of Communication, etc.**—A telegraph line extends from the Urals to Nikolaevsk at the mouth of the Amur. Besides the railway to Tiumen one across the country from Orenburg to Vladivostok was begun in 1892, and is (1895) well advanced. The section from Cheliabinsk (where it connects with the European system) to Omsk is already completed, as is also a piece 255 miles long at the eastern end, extending N. W. from Vladivostok. The chief towns are Omsk (pop. 54,721 in 1890); Irkutsk (50,274); Tomsk (41,856); Tiumen (35,396); Tobolsk (21,336).

**LITERATURE.**—The encyclopedic and more complete works on Siberia are naturally in Russian, and the German literature is large. The following are the works available in English and the more classical of the German books: *Mittendorf, Reise in dem äussersten Norden und Osten Sibiriens* (4 vols., 1851–60); Kennan, *Tent-life in Siberia* (1870), also magazine articles by this author; Seebohm, *A Visit to the Valley of the Yenisei* (1879); Mudge, *Fur-clad Adventures through Alaska, Kamchatka, and Eastern Siberia* (1880); Nordenskiöld, *Voyage of the Vega* (1881); Iadrintzef, *Sibirien, geographische, ethnographische, und historische Studien* (trans. from Russian, 1886); Landsdell, *Through Siberia* (2 vols., 1882); Woelfel, *Die Klimate der Erde* (2 vols., 1887); De Long, *Voyage of the Jeannette* (2 vols., 1881); Melville, *The Lena Delta* (1885); *Lenamündung* of the Russian International Polar Expedition; Price, *From the Arctic Ocean to the Yellow Sea* (1892).

MARK W. HARRINGTON.

**Sibilants** [from Lat. *sibilans*, partic. of *sibilare*, to hiss]: in phonetics, a group of fricatives or spirants characterized by a hissing sound. This hissing sound is produced by a current of breath directed by the blade of the tongue against the teeth. The commonest examples are *s* as in *sun*, *sh* (ʃ) as in *shine*, *z* as in *zinc*, *zh* (ʒ) as in *azure*; *s* and *sh* are voiceless, *z* and *zh* are voiced; *s* and *z* are produced by a sharper or more concentrated current of breath than *z* and *zh*, in which the tongue is drawn back and the point slightly raised. See SPIRANTS and CONSONANT.

BENJ. IDE WHEFLER.

**Sibler**, WILHELM, Ph. D.: clergyman; b. at Breslau, Prussia, Nov. 12, 1801. After a gymnasium course he served for two years and a half in the Prussian army, rising to a lieutenantancy; studied in the military school at Berlin; abandoning military life, studied philosophy and philology in Breslau and Berlin; gymnasium professor at Dresden 1834–37; tutor in Livonia, Russia, 1837–41. Having studied the-

provident felling and abuse of pasturage. In consequence the water-supply is uncertain and limited. The heavy winter rains are of little benefit, being neither absorbed by the soil nor collected in natural or artificial storehouses for the dry season. Still, evaporation from the surrounding seas mitigates the heat, and its condensation on the summits of the northern coast range furnishes a supply of water which, though badly economized, somewhat protects the soil from droughts. The principal rivers are the Giaretta, formed by the union of the Simeto and Gurnalunga, the Cantara, Salso, Platani, and Belici. The numerous smaller streams are often obstacles to internal communication from the violence of their currents in winter and from the difficulty of constructing secure bridges over them. The larger number are dry in summer. The temperature is generally agreeable, except during the prevalence of the parching sirocco. The climate is not unhealthful, except in the many localities rendered almost uninhabitable by malaria.

**Minerals.**—The minerals correspond with the geologic formations of which the island is composed—Primitive at the N. E., Secondary along the N., and mainly Tertiary through the rest of Sicily. Sulphur and rock-salt are the most important mineral products. The marbles, jaspers, and agates are fine. Lignite and alum are found, and also at the eastern coast amber, usually of a transparent yellow, but sometimes blue or green.

**Agriculture and other Industries.**—The soil, almost nowhere alluvial, is exceedingly fertile wherever water can be secured for irrigation. Agriculture is carried on only in the rudest and most primitive way, and until recent years insecurity of life and property have prevented investment in rural improvements. Excellent wheat is raised in large quantities, but generally exported, the necessities of the inhabitants being supplied by the importation of a cheaper and inferior article. The vineyards produce delicious wines of various kinds. Hemp, saffron, and sumach are grown. The mulberry is cultivated for the silkworm. Almonds, figs, olives, lemons, oranges, and tobacco are raised extensively. The cultivation of cotton and the sugar-cane has greatly decreased. Manufactures are unimportant and hardly more than supply the wants of the working-classes. Fishing is prosecuted with energy. The tunny is taken and cured at different points along the coast, and sardines and anchovies are shipped to foreign ports in large quantities. Means of intercommunication are very defective. There are few highways, the roads are mostly bridle-paths, and the towns of the interior are generally not accessible by small carriages. In 1894 633 miles of railway had been opened up.

**Language and Literature.**—The Sicilian dialect resembles that of Calabria. It generally agrees with the Tuscan in vocabulary, but with the frequent substitution of *u* for *o* final, of *ll* by *dd*, and with the omission of the *u*-sound after *q*; but it possesses many words from the Arabic and others from unknown sources. Though not a literary language, it has ancient chronicles in the popular speech and some modern poems justly admired. Education, though making progress, is still in a backward state, and Sicily is far behind continental Italy.

**History.**—The earliest known inhabitants were the Sicani or Siculi, who crossed from Italy. At an early period the Phœnicians planted their factories along the coast and introduced the Phœnician worship. They were shortly followed by Greeks, who so thoroughly colonized the island in the eighth and seventh centuries before Christ that all its ancient culture and civilization were of Greek origin; but the colonists, being from many different states, were disinclined to unite in any common organization. The cities they founded were governed by oligarchies or tyrants, but though often at war with each other rose to great wealth and power. The Carthaginians in great force invaded Sicily, but received a crushing defeat at Himera (480 B. C.). Then followed the most brilliant half century of the Greek domination. Troubles among the cities furnished a pretext for the disastrous Athenian expedition (415 B. C.). After 409 B. C. the Carthaginians gradually mastered most of the island, but were sturdily resisted by Dionysius, tyrant of Syracuse. At the close of the first Punic war (241 B. C.) they were forced to cede their Sicilian possessions to the Romans, Syracuse still remaining independent; but all Sicily became a Roman province—the first Rome possessed—at the close of the second Punic war, and so continued until 395, when, on division of the Roman empire, it became part of the empire of the East. Christianity was early intro-

duced, apparently from Rome. Overcome by the Goths, Sicily was delivered by Belisarius and continued a Byzantine possession until 827, when its subjugation was commenced by the Saracens and was completed in 878. Under the Mussulman sway agriculture, manufactures, and commerce steadily increased. In 1061 the wealthy island tempted the Normans under Roger Guiscard, but it was not wholly subdued until 1090. The Normans held it until 1194, when it passed to the Hohenstaufen emperors, who were replaced in 1268 by Charles of Anjou and the French. The massacre of the SICILIAN VESPERS (*q. v.*) ended the power of the latter (1282), and the island came into the hands of Peter III. of Aragon. The Aragonese dynasty reigned till 1504, after which until 1706 Sicily was under the Spanish crown. Then for brief periods it was held by Austria, Savoy, Austria, and Spain, till in 1735 it was reunited with Naples under Don Carlos as King of the Two Sicilies, and was ruled by his house until its liberation (1860) by Garibaldi and its incorporation into the kingdom of Italy. Its condition in the Middle Ages was deplorable. Its nominal independence was limited to control of its internal affairs, while its rulers constantly neglected to defend it against the Mussulmans; but great progress has been made since 1860.

All the ancient peoples who ruled Italy—the Siculi, Phœnicians, Greeks, Carthaginians, and Romans—have left monuments of their occupation. Those by the Greeks are stupendous, and include the vastest and most splendid existing remains of Greek temples. These are specially to be seen at Selinonte, Girgenti (*Agrigentum*), Segesta, Syracuse, and Himera. Even the reconstructed Roman theaters of Syracuse, Segesta, Taormina, and Palazzolo rest on Greek foundations. In Sicily are found very beautiful ancient pottery and unsurpassed medals. Some edifices date from the Byzantines and Saracens, but the most important memorials of the latter are the useful plants, such as sugar-cane and cotton, which they introduced.

**Population.**—Sicily is divided into the provinces of Catanzetta, Catania, Girgenti, Messina, Palermo, Siracusa, and Trapani. Total population (1881) 2,927,901; 1893 (official estimate), 3,404,665. Principal cities: Palermo, 276,000; Messina, 146,400; Catania, 121,000.

**LITERATURE.**—See Freeman, *History of Sicily* (4 vols., Oxford, 1891); also Freeman, *Story of Sicily* (New York, 1892); Amari, *Storia dei Musulmani di Sicilia* (3 vols., Florence, 1854-72); Lloyd, *History of Sicily to the Athenian War* (London, 1872); Chiesi, *La Sicilia illustrata nella Storia, nell'Arte, nei Paesi* (1892); Di Giovanni, *Filologia e Letteratura Siciliana* (2 vols., Palermo, 1871); Lo Faso, *Duca di Serradifalco, Antichità della Sicilia* (5 vols., folio); Evans, *The Classic and Connoisseur in Italy and Sicily* (3 vols., London, 1835); also the *Tours of Brydone*, Sir R. C. Hoare, and Simond.

E. A. GROSVENOR.

**Siekingen, FRANZ, von:** champion of the Reformation; b. Mar. 2, 1481, in the castle of Ebernburg, near Kreuznach, in the present Rhenish Prussia; was one of the wealthiest and most powerful knights of his time, and was treated with much regard both by Charles V. and by the French king, Francis I. He spent all his time in feuds with his neighbors, and, having come into contact with the new religious ideas through his friend Ulrich von Hutten, he formed a plan of carrying through the Reformation by force. As the despoiling of the Roman Catholic Church of all its property and the distribution of its estates among the knights formed the principal points of his plan, he expected support from the nobility, and pamphlets were written and spread among the peasantry in order to arouse them, too, against their ecclesiastical lords; but the attempt entirely failed. One after another his castles were taken, and at last he was compelled to surrender himself, together with his last castle, Landstuhl, near Kaiserslautern. D. May 8, 1523.

**Sickles, DANIEL EDGAR:** soldier; b. in New York, Oct. 20, 1825; was educated at the University of New York, but left without graduating; learned the printer's trade, then studied law, and was admitted to the bar in 1846. He soon became identified with politics, and in 1847 was elected to the State Legislature as a Democrat. In 1853 he was appointed corporation attorney of New York city, and the same year accompanied Mr. Buchanan to England as secretary of legation. Returning in 1855, he was elected State Senator, and the following year was chosen member of Congress from New York city, and re-elected in 1858 and in 1860. On Feb. 27, 1859, he shot and killed Philip Barton

born in Washington but improper intimacy with his wife, and his refusal to stand for murder, had inspired. On the outbreak of civil war he joined the Federal Brigade, and in June, 1861, was appointed colonel of one of its regiments in Pennsylvania, New York. In Sept. 1861, he was commander of the second regiment of Volunteers. The appointment was at first objected to by the Senate, but subsequently confirmed to him from original appointment. In the Virginia Peninsula campaign his brigade was attached to Hooker's division of the Third Corps, to the command of which he succeeded in Sept., 1862, and having been unanimously re-appointed on November 30, 1862, was assigned to the command of the Third Army corps in Feb. 1863. He was heavily defeated at the battle of Chancellorsville May 3 & 4. An infection he ran a leg early in the second day's fight. In 1865-67 he commanded the military district comprising South and North Carolina. On July 28, 1869, he was appointed colonel of the Forty-second Infantry of the regular army, and in April, 1870, was retired from active service with the rank of major-general. In the latter year he was appointed U. S. minister to Spain, which position he held until 1876. Returning to New York he became president of the State board of civil service commissioners. He succeeded the House of Congress and major-general U. S. Grant for governor. In 1896 he was appointed minister to Mexico and in 1899 minister to Mexico but declined both positions. In 1900 he was appointed sheriff of New York in place of Hild, and in 1902 was elected to the Federal Circuit.

Miyagi City, on the Tanabe Peninsula, capital of the province of Aomori, in the Tohoku region, which was founded on the site of the traditional hill on the W. by Aoba and Akita, on the E. by Iwate and Utsunomiya, on the S. by Iwate. The city is surrounded by the straits of Vassiloff. Since the war, it has been the main port on the Tohoku coast of shipping and foreign trade. In history Miyagi played an important part, especially in the Meiji period, as the gateway to the province of Aomori. It is a city of 100,000 people. A. H. S. S.

**SHILLINA, SARAH** : BETTER: daughter of Roger Kemble; b. at Faversham, Kent, Eng., July 5, 1787; played as a girl in her father's company; married Mr. Shillina, an actor, in the year of childhood; couple had first appearances at Drury Lane, with Garrick, as Portia in *The Merchant of Venice*, in 1794, and in 1800; retired in the same year, but joined in the profession with success, and resided in London in 1792. This time she made a deep impression as Isabella in *The Fatal Marriage*, and began her career of successful appearances. For thirty years, until her retirement June 29, 1812, she was the queen of the English stage. Her best-known and favorite characters were Lady Macbeth, Queen Elizabeth, Queen Catherine, Jane Shore, Isabella, Ophelia, Desdemona, Portia, and Trueman—improvements of tragedy roles and comedy's. To her contemporaries she was a prodigy of genius. Yet in the opinion of judges her ordinary manner was imperfect. Her effects were produced by constant, open, attitude, expression of voice, and countenance, and by intense concentration of feeling, which often led her to transport her audience as well as herself. The public readily also gave to Shillina after her withdrawal from the stage did not add to her fame. Her last appearance on an actress was in 1816, when she played Mrs. Corbin Kemble's daughter. Thenceforth she lived in retirement, honored as a woman of stainless reputation, and respected in all the traditions of life. D. in London, June 8, 1841. Her portrait was painted by Sir Joshua Reynolds, and a record of her best; her life was written by Thomas Campbell (1864) and by Mrs. Kemble (London, 1866).

Revised by H. H. VALENTINE

Adolf, Wilhelm Husey: soldier; b in New York, Aug. 9, 1901; graduated at the U. S. Military Academy, sixth class class, July, 1923, when assigned to the First Artillery as second lieutenant; received the following decorations and adapted the profession of civil engineering. For actions in the city suburbs of New York, an assistant engineer on the German expedition, and Alaskan engineer of engineers in Manchuria and New York; was assistant engineer in the hydrographic survey of the delta of the Mississippi river; in 1931-32 was assistant in the exploration and survey of a railroad route across the bottom of Tehuacan. The second expedition was abandoned in 1936, due to financial short-comings. On the outbreak of civil war, was commissioned major of the Fifteenth U. S. Infantry but without joining his regiment was at once assigned

in duty as an infantry officer in the department of the Cumberland. In July 1862, he was detailed as acting assistant adjutant general of that department, continuing as such until transferred to Louisville, then acting assistant adjutant general of Kentucky, remaining upon duty until the outbreak of general insubordination of recruiting and draft authorities in that State. In 1863, he arrived at his regiment, the Fourth Indiana, as the youngest colonel of which he had been promoted in 1861, a rank which he earned in Mexico Territory until 1860, when placed in charge of the depot of the general recruiting service at Fort Leavenworth, Kan. He retired from active service Dec. 15, 1870. He died in New York, July 1, 1874. His marriage and full list of service in the war he was breveted colonel and brigadier general, U. S. Army.

Sidereal Time: 5h 7m

**Sid'erite** (from Gr. *sidēra*, iron): the iron pyrite mineral.  
For another iron ore, see **Iron**.

**Sidgwick, Henry** (1862-1952), D.Litt., D.D., D.C.L., philosopher and economist, born at Skipton, Yorkshire. Educated at Marl at 1884, educated at Rugby School and Trinity College, Cambridge, became fellow and lecturer at Trinity College 1900, reader in moral science in 1925 and Professor of Moral Philosophy in Cambridge University in 1928. He has published *Methods of Ethics* (1927, 4th ed. 1931); *Principles of Political Economy* (1930); *History of the History of Ethics* (1936); *Elements of Politics* (1939); and many articles and general publications. J. M. B.

**Sidmouth, Henry Addington, Viscount Sidmouth**, 1st Baron, of Reading, England, May 30, 1757; educated at Winchester School and at Brasenose College, Oxford; studied law; was admitted to the bar 1784; entered Parliament in 1786; rose through the influence of the younger Pitt, to whom he gave an efficient support during his administration; was Speaker of the House of Commons from 1795 until 1801, when, on the resignation of Pitt as Prime Minister, he formed a new ministry, accepting the post of Chancellor of the Exchequer and First Lord of the Treasury; directed the negotiation of the Peace of Amiens 1802; supported a war policy 1803; resigned June 1804; was raised to the peerage and made president of the council Jan. 12, 1805; was Lord Privy Seal to the Grenville and Fox ministry 1806-07; was Home Secretary 1812-22, and a founder of the cabinet without a portfolio, 1822-24, when he became unpopular on account of his excessive indisposition, after which he retired from public life. D. at Richmond Park, Feb. 15, 1844.

**Sidney:** village, capital of Shelby co., O.; on the Miami river, the Miami and Erie Canal, and the Cinc. Ham. and Dayton, and the C. and O. r. r., C. and St. L. railways, 31 miles S. of Lima, 40 miles N. of Dayton (for location, see map of Ohio, ref. 4-6). It is an agricultural region, is principally engaged in manufacturing, and contains a public high school, public library (founded in 1896), 2 private banks, and a daily and 2 weekly newspapers. Pop. (1900) 3,824; (1909) 4,860.

**Sidney, or Sydney, ALFREDUS**: revolutionist; b. at Penrhyn, Kent, England, in 1692, a son of the second Earl of Leicester; in 1662 accompanied his father, who was appointed ambassador to Denmark, and four years later to France. In 1661 he served as captain of a troop of horse in Ireland, of which his father had been made lord-lieutenant. When the great rebellion broke out, he took the side of the Parliament, and was made a captain of horse in the regiment of the Earl of Manchester. He was severely wounded at the battle of Marston Moor July 2, 1644; and in 1646 was made colonel of a regiment in Fairfax's army and governor of Rochester. In 1646 his brother, Lord Essex, was appointed lord-lieutenant of Ireland, and he was made lieutenant-general of horse and governor of Dublin; in 1647 he received the thanks of the House for his services in Ireland, and was made governor of Dover. In 1648 he was one of the judges at the trial of Charles I., but was not present when sentence was passed, and did not sign the warrant for the execution, though his influential characterized it as "the patient and bravest action that ever was done in England or elsewhere else." Being opposed to the protectorate of Cromwell, he retired from Parliament in 1653, but when the Long Parliament was restored in 1659, he resumed his seat, and was named one of the council of state, and was sent as one of the

English commissioners to negotiate a peace between Sweden and Denmark. He was absent from England at the time of the Restoration, and, not acceding to this, he lived abroad in exile for nearly eighteen years. In 1677 he received a pardon from the king, with permission to return to his native country; twice unsuccessfully stood for a seat in Parliament, and was considered as being in league with Monmouth, Essex, William Lord Russell, and other popular leaders. The discovery of the Rye House plot in 1683 gave the court an opportunity of ridding itself of so dangerous an opponent. He and Russell were arrested and committed to the Tower on a charge of high treason. The only witness as to the main facts charged was Lord Howard, who by his own confession had been a party to the plot, and was ready to swear away the lives of his associates in order to save his own. The law required two witnesses to prove the alleged crime, and under the decision of the infamous Chief Justice Jeffreys the other witness was found in a manuscript on government which had been discovered among the papers of Sidney, in which it was maintained that a people had the right to depose an unworthy sovereign. The trial was opened Nov. 7, 1683; sentence was pronounced on the 26th; and on Dec. 7 he was beheaded on Tower Hill, London, and buried the next day at Penshurst. The reversal of the act of attainder was one of the earliest acts of the first Parliament of William and Mary. His *Discourses concerning Government* was published in 1698, and a 4th ed., with some miscellaneous writings, in 1772. *Lives of Sidney* have been written by Meadley (London, 1813), Van Santvoord (New York, 1851), and A. C. Ewald (London, 1873).

**Sidney, or Sydney**, Sir PHILIP; author and statesman; b. at Penshurst, Kent, England, Nov. 9, 1554; studied at Oxford and at Cambridge; traveled extensively, visiting Belgium, Germany, Hungary, and Italy, in all of which countries he was noted for his skill in knightly exercises as well as for his fondness for literature and art. He returned to England in 1575, and, aided by the influence of his uncle, the Earl of Leicester, rose to high favor at court. In 1576 he was sent on a mission to Vienna, but after his return he lost the queen's favor, probably in consequence of his bold remonstrance against the project of her marriage to the Duke of Anjou, and retired for a time to the seat of his brother-in-law, the Earl of Pembroke, where he devoted himself mainly to literary pursuits. Here he wrote, between 1579 and 1581, his pastoral romance *Arcadia*, which was never completed, and his *Defence of Poesie*, upon which his literary fame mainly rests. In the meantime the queen's favor for him revived, and he took a prominent part in all pageants of the court. He fell deeply in love with Lady Penelope Devereux, afterward Lady Rich and Lady Mountjoy, whom he celebrated under assumed names in his *Arcadia* and in the series of love sonnets entitled *Astrophel and Stella*, published soon after his death (1591). In 1583 he was knighted, and married the daughter of Sir Francis Walsingham. In 1585 he wished to join Sir Francis Drake in his second expedition against the Spaniards in the West Indies, but the queen forbade this, fearing, as she said, "lest she should lose the jewel of her dominions." It is said, probably without good grounds, that the crown of Poland was offered to him. The war was raging between Spain and the Netherlands, and Elizabeth made some show of assisting the Dutch. In 1585 Sidney was appointed governor of Flushing, and soon after was made general of horse under his uncle, the Earl of Leicester, in which capacity he gave promise of much military ability. On Sept. 22, 1586, he encountered a body of the Spaniards under the walls of the town of Zutphen. Sidney was severely wounded, and died at Arnheim, Oct. 7, 1586. The well-known story of his refusing the cup of wine, when fainting from loss of blood, in order to give it to a wounded soldier, has been questioned, but, whether true or false, well illustrates his chivalrous and generous character. His body was conveyed to England, where it lay in state for several days, and a general mourning, the first of the kind in English history, was observed. Sir Philip Sidney is perhaps the best English model of knightly virtues, and his character has always been a favorite theme with poets. His writings had great celebrity in their day, but they are marked by the strained and artificial style of the period. His *Arcadia* was first published soon after his death (1590) as *The Countess of Pembroke's Arcadia* (reprinted, London, 1868). His *Complete Works* appeared in London in 3 vols. in 1725; his *Miscellaneous Works*, with a

memoir, were published at Oxford in 1826, reprinted at Boston in 1860; his *Complete Poems*, edited by Rev. A. B. Grosart, were published at London in 1873. See the *Life*, by J. A. Symonds (London, 1886; 2d ed. 1889). See ENGLISH LITERATURE. Revised by H. A. BEERS.

**Sidon, or Zidon** [from Lat. *Sidon* = Gr. *Σιδών*, from Heb. *Tsidhōn*, Sidon, liter., fishing-place]: an ancient city in Phœnicia, on the Mediterranean, in lat. 33° 34' N. (see map of Palestine, ref. 3-E). Its origin, lost in antiquity, is due, according to Josephus, to Sidon, the oldest son of Canaan, and it is referred to even in the book of Genesis. Celebrated for its manufactures and commerce, its name was applied to the whole country and nation. Homer calls the Sidonians "skillful in all things." Sidon had trade-stations in Sicily, Sardinia, Spain, and Northern Africa; its fleets visited the British islands and the Baltic; and its purple, glass, linen, gold, silver, and ivory wares were famous a thousand years. Its most brilliant period began about 1600 B. C., but it was ultimately eclipsed by Tyre. Captured by Shalmaneser, King of Assyria, about 720 B. C., it was almost utterly destroyed during its revolt against the Persian Artaxerxes (351 B. C.). Rebuilt, it never regained its former splendor. Under the Greek, Syrian, and Roman dominion, it further declined. Alternately held during the crusades by the Christians and Mussulmans, it was razed by Malek Ashraf in 1291. In the vicinity were discovered (1887) sarcophagi of unsurpassed workmanship (now the chief treasure of the Museum of Constantinople), one of which is perhaps that of Alexander the Great.

**Siebold**, zee'bōlt, PHILIPP FRANZ, Freiherr von: traveler, physician, zoölogist, and botanist; b. at Würzburg, Bavaria, Feb. 17, 1796; studied medicine and natural sciences; entered the service of the Dutch East India Company, and was appointed leader of a scientific mission which arrived at Nagasaki in 1823. He soon acquired an extraordinary influence over the Japanese, whose language he mastered, and in 1826, when he accompanied the Dutch embassy to Yedo, he was allowed to remain behind, the only foreigner in the hermit city. The sale of a map, however (see ISON, brought him into difficulties, and after a term of imprisonment he was finally banished from the country in 1830. On his arrival in Holland he was created a baron, and spent the next twenty-nine years of his life in writing and in arranging his scientific collections at Leyden, Munich, and Würzburg. European gardeners owe to him the introduction of Japanese lilies, peonies, camellias, chrysanthemums, and other attractive plants. At the close of his life he returned to Japan. His great work is a folio, magnificent y illustrated, *Nippon, Archiv zur Beschreibung von Japan*. D. at Munich, Oct. 18, 1866. J. M. DIXON.

**Siedlee**, si-ed'ltśā: town of Russia; the capital of the government of Siedlee (see map of Russia, ref. 8-A). It has a fine palace surrounded with beautiful gardens, distilleries, sugar-refineries, and manufactories of agricultural implements. Pop. (1890) 14,015, two-thirds Jews. The government of Siedlee, comprising an area of 5,535 sq. miles, with 671,598 inhabitants in 1890, is situated to the W. of the river Bug, between the governments of Lomza, Warsaw, Radom, Lublin, Volhynia, and Grodno, and occupies nearly the same territory as the old palatinate of Podlachia.

Revised by M. W. HARRINGTON.

**Siege** [from O. Fr. *siege*, Fr. *siège*, deriv. of *regier*, to-siege; Span. *sitiar*; Provenc. *setjar* < Lat. \**sedicare*, deriv. of *sedere*, sit]: the investing of a fortified place by an enemy for the purpose of compelling its surrender by continued offensive operations. Modern fortresses are of two general types—single fortresses, consisting of an enceinte and its outworks (see FORTIFICATION), and intrenched camps, consisting of the former combined with detached works. (See INTRENCHED CAMPS.) The latter may be defended simply by its garrison or by a large army in addition to the garrison. The methods of attack will vary with these different circumstances, and may be classified as (1) siege of a single fortress; (2) siege of an intrenched camp defended by its garrison simply; and (3) siege of an intrenched camp occupied by an army.

1. The method perfected by Vauban in the latter half of the seventeenth century applied to the first case, and under ordinary circumstances with the proper force—five or six

Feb., 1871) is an illustration. The works planned for the defense of this place were not all completed at the breaking out of the war, and some of the points selected for the detached works were occupied by field-fortifications of the semi-permanent type. These were selected by the Germans as the point of attack. The investment was completed Nov. 3, the garrison consisting of 16,000 and the attacking force of 30,000 men, increased about the middle of January to 80,000. A bombardment was opened Dec. 3, and continued night and day until Feb. 13, during which time more than 500,000 projectiles were thrown into the place. In five days nearly every house in the city had been struck. The defense, under Col. Denfert-Rochereau, was gallant and skillful. For many weeks he kept the enemy at a distance by first occupying exterior positions, and then freely using his projectiles at long range. This kept the line of investment so attenuated that the attacking force was inadequate. Moreover, the latter was compelled to throw up lines of circumvallation against the threatening force under Gen. Bourbaki, and to use part of its artillery in defending them. The detached field-works were finally evacuated Feb. 3-8, the approaches having reached the ditch. Thus, after 98 days' investment and 68 of bombardment, the attack found itself just where it would have been on the first day of the siege had it not been for these field-works. Further operations were to be pushed against the main works, but the garrison was ordered out of the place by the French Government, and turned it over to the Germans Feb. 17 and 18, Paris having capitulated Jan. 28. That a well-managed assault may sometimes be successful against an intrenched camp was proved by the capture of Kars by the Russians on the night of Nov. 17-18, 1877. The defenses consisted of twelve detached permanent forts and a citadel, all built since the Crimean war. Some of the forts were connected by lines of trenches thrown up during the war of 1877. They were manned by a full garrison of about 23,000 Turks armed with the best modern breech-loaders. The attacking force was about 35,000 men. The Turks are considered the equals of any troops in the world when fighting in a fixed position, as behind fortifications, yet this assault resulted in the killing or capture of the entire garrison, with the exception of thirty or forty men. The most prominent features of its management were that no intimation had been given to the enemy that it was contemplated, the points of attack were skillfully selected, the various columns attacked simultaneously, and a moonlit night was selected for it, when the light was sufficient to prevent confusion among the columns, though not sufficient to expose them at a distance to the view of the enemy.

III. When the intrenched camp is occupied by an army, the difficulties of forcing an entrance are greatly magnified; and if the army is not very much inferior to the attacking force, they will probably be insuperable. The method of blockade may then be resorted to, with a view to exhausting the supplies of the besieged of ammunition and provisions. Here the attack and defense consist at first of a struggle for the possession of the communications with the place. These being once all secured by the attack, their further operations consist mainly in harassing the garrison by a distant bombardment while vigilantly guarding against the introduction of supplies or re-enforcements. The defense consists in keeping up a fire upon the enemy, with occasional sorties in large bodies, the object of which is to make a permanent break in the cordon, with a view to its destruction or to cover the introduction of re-enforcements. The sieges of Atlanta and Richmond during the civil war in the U. S., and of Metz and Paris in the Franco-German war, are illustrations. In the cases of Atlanta and Richmond the operations were confined to the preliminary struggles for the communications. Having lost these, the defenders withdrew at their last opportunity, preferring the immediate loss of the place to the sacrifice of both place and troops a few weeks later. At Metz, although the army of Bazaine was driven into the fortress and kept there against its will, and weakened the fortress for resistance to blockade, nevertheless it offered an immense obstacle to a forced entrance. The general method of occupying the ground by the Germans was about the same both around Metz and Paris. A first line of outposts was established from half a mile to a mile from the works. These were intrenched, and were strong enough to resist small parties of the enemy, but not a heavy force. Behind these was a carefully selected position, forming the main line. Its distance from the works depended upon the nature of the ground, and varied from

1 to 3 miles, the normal distance being  $2\frac{1}{2}$  miles, or a little more than the effective range of the guns of the enemy. It was fortified by rifle-trenches and gun-emplacements of the strongest profile, strengthened by abattis or other obstacles, with occasionally an inclosed work capable of offering independent resistance. Farther to the rear central points were selected and fortified, at which the reserves were posted, and upon which the troops were to rally in case of the enemy's success in breaking through the cordon. The length of the line of investment of Metz was 24 miles, and of that at Paris 45 miles. In each case the besieging force was about 200,000 men. The holding of such lines by such numbers would have been utterly impracticable previously to the modern improvements in small-arms and the introduction of the free use of continuous lines of intrenchments. As it is, when the investment is once closed the besieging army has a great advantage over the defenders, since it can accomplish its purpose without leaving its works. The rôles are reversed, and the besieged are compelled to throw themselves against the intrenchments, where they are sure to meet with destruction. The army in Metz was 173,000 strong and that in Paris 500,000, many of the latter, however, worthless as soldiers. The former capitulated after 70 days' blockade, and the latter after 129 days'. The operations about these cities, especially Metz, give rise to the curious but essential question, Can one army invest and besiege another of equal magnitude? The object of the sorties from Metz was to break through the cordon and get away with the active army, leaving the place to be held by its garrison. The fortifications aided such attempts; and if they had been mere field-intrenchments which were being evacuated, the beleaguered army would have had still less chance of success. The answer, then, seems to be, Let an army somewhat demoralized by defeat simply lie dormant for a while, and it may be invested by equal numbers and taken by siege. The so-called siege of Plevna, July to Dec., 1877, was one of the most prominent features of the Russo-Turkish war of 1877-78. Upon its occupation by the Turkish army, about the middle of July, Plevna was without defenses. The construction of field-fortifications was continued, almost under the fire of the enemy, during the five months which followed, until there was an intrenched camp, having 47 detached works, supplemented by numerous lines of trenches, and occupying a perimeter of about 23 miles. The Russians attacked the place on July 20 with a small force—about 7,000 men—and were repulsed with a loss of more than one-third their number. They assaulted again on July 30 with 30,000 men, and were repulsed with a loss of over 7,000. They again assaulted Sept. 11, with 90,000 men, after a four days' bombardment, and were repulsed with a loss of 18,500 men. They then concluded to resort to a blockade. The investment of the place was completed Oct. 24, after a hot contest for the last communications, the Turks committing the error of allowing themselves to be shut in, instead of abandoning the place before it was too late. The line occupied by the Russians was 46 miles long, the force employed being about 110,000 men. The Turks at this time had about 40,000. Subsequent operations were limited to strengthening the defenses on both sides, with the exception of the partial assaults of Oct. 19 and Nov. 8, the object of which was to gain certain points by which the line of investment could be shortened. By Dec. 10 the Turkish commander, Osman Pasha, having consumed all of his provisions, found himself compelled to surrender or to leave his works and throw himself against the fortifications which surrounded him, in a desperate attempt to cut his way out. He chose the latter alternative, lost in the attempt 6,000 men, killed and wounded, while inflicting a loss of but 1,800 upon the enemy, and then surrendered.

The blockade may be applied to a single fortress, but its chances of success will then be less favorable, for the reason that the number of mouths in the place being comparatively small, the stock of provisions may be such as to enable it to hold out longer than the requirements of the besieger will permit.

IV. For a long period in the early history of war, when the arms employed were slings and arrows, the high and thick walls of fortresses offered insuperable obstacles to a forced entrance. Sieges then were simple blockades. At a later date mining was resorted to; ramps of earth and wood were thrown up, beginning beyond the range of an arrow, and sloping upward to the top of the wall; or the battering-ram was employed to effect a breach. The method of carrying on the operation among the Greeks and Romans

a pyrometer, etc.; and published *On a Regenerative Condenser* (1850); *On the Conversion of Heat into Mechanical Effects* (1853); *On a Regenerative Steam-engine* (1856); and *On the Increase of Electrical Resistance in Conductors, with Rise of Temperature, and its Application to the Measure of Ordinary and Furnace Temperatures* (1871). He was knighted Apr., 1883, and died Nov. 20 the same year. See his *Life* by W. Pole (London, 1889).

**Siemens's Armature:** See ELECTRIC MOTOR.

**Siemens's Regulator:** See ELECTRIC LIGHTING.

**Sienna, sē-ā'nā, GUIDO, da:** painter; b. at Sienna, Italy, about 1200. A picture of his dated 1221 still exists. He was one of the first Italian painters to break away from Byzantine traditions, and is the artist who confirms the priority of the Siennese school to the Florentine. He did not paint in fresco, but on panel. His best-known picture, a Virgin holding the Divine Child on her knees, is in the Dominican church at Sienna. Another Madonna, dated 1262, at San Bernardino is supposed to be by this artist. W. J. S.

**Sienna** [It. *terra di Siena*, earth of Sienna]: an ochreous earth which when ground forms an excellent pigment called raw sienna, and when burnt assumes a still richer orange-red tint. It is brought from Italy.

**Sienna** (Ital. *Siena*, anc. *Sena Julia*): city of Tuscany, Italy; chief town of the province of Sienna; covering a beautiful hill 1,100 feet above the sea, a spur of the Chianti chain; in lat. 43° 22' N., lon. 11° 11' E.; 60 miles by rail S. of Florence (see map of Italy, ref. 4-D). The walls are about 4 miles in circumference; the citadel occupies the northwest corner of the town, which is entered by nine gates; and the principal streets radiate in irregular lines from the Piazza Vittorio Emanuele, a fine large open space nearly in the heart of the city. The Duomo, or Chiesa Metropolitana, one of the finest specimens of Gothic architecture in Italy, stands on an elevation not far from the center of the town. Its length is about 300 feet, its mean width 120 feet. The western façade is magnificent in color and in the richness of its sculptures. The effect of the interior is peculiarly picturesque, partly from the horizontal layers of black and white marble of which not only the walls but even the columns are composed, and partly from the roofing, which is a vault of blue studded with stars. The pavement is of marble inlaid in various styles, the work of different artists from the fourteenth to the sixteenth century, the most distinguished of these being Beccafumi (1517). The marble pulpit is adorned with some of the finest reliefs of Nicola Pisano and his school. The bronze tabernacle, the pictures by Duccio (1300), several early works of Michelangelo, the celebrated frescoes of Pinturicchio (1502) representing scenes from the life of Pius II., the fonts, the vases for holy water, the large collection of old choir-books exquisitely adorned with miniatures, are among the countless other objects of the highest interest to the student of art. In the Church of S. Agostino and in several others, in the ex-convent of S. Domenico, and in many private palaces are choice pictures by early painters, above all by Sodoma. The Academy of Fine Arts is very rich, especially in pictures of the Siennese school. The university, founded in 1321, was formerly very celebrated. There are cloth and furniture factories, but the industries are small.

As early as the reign of Charlemagne Sienna was governed by a count. In the disputes between the papacy and the German emperors it at first took the side of the former, and like its neighbors, Florence and Pisa, developed into an independent commonwealth. In 1186 Sienna joined the other large Tuscan commonwealths in their resistance to Henry, son of Frederic Barbarossa, but after some successes was reconciled to the emperor, and thenceforward it continued, for the most part, steadfastly Ghibelline. In 1260 the Siennese inflicted a crushing defeat on the Florentines at Montaperti, but hostilities were frequently renewed afterward. An awful plague, known as the black death, broke out in 1348, and continued to appear until toward the close of the century. During the first year of this frightful malady 80,000 persons are said to have perished in the city and territory of Sienna. In 1480 the government of the commonwealth fell into the hands of Pandolfo Petrucci, who continued to direct public affairs successfully until 1512. After his death the Medici, with Spanish help, annexed Sienna to the territory of Florence. From this time its history is almost one with that of the rest of Tuscany. Pop. (1893) 29,000.

Revised by M. W. HARRINGTON.

**Sierra:** See MOUNTAIN.

**Sierra Leone, si-ār'raā-lē-ō'nē:** a British colony on the northern end of the Guinea coast, Africa, from 7° to 9° N. lat., including about 150 miles of coast and extending 100 miles inland. Area about 15,000 sq. miles. The soil is fertile, especially in the low coast-land, but the climate is extremely hot and unhealthful, especially in the wet season. The rainfall at Freetown is about 110 inches, of which two-thirds fall in July, August, and September. All tropical plants and fruits grow luxuriantly, and palm oil, pepper, ginger, gum-copal, ground-nuts, etc., are exported. Sugar, coffee, indigo, and cotton have been introduced, and succeed well. The settlement was made in 1787 with a philanthropic purpose, the idea being to form a home, or at least a place of refuge, for free Negroes, and in spite of its climate, which is very unhealthful for Europeans, the colony is steadily growing. The chief products and exports are palm oil, palm-kernels, benni-seeds, ground-nuts, kola-nuts, India-rubber, coal, and hides. The capital and chief port of the coast is Freetown, which is fortified and is a naval coaling-station. Pop. (1893) 180,000, with 224 whites. Administration is actually effective over only about 75,000 of the population.

Revised by M. W. HARRINGTON.

**Sierra Madre, -mā-drā', or Sierra Madre del Pacifico:** the irregular chain of mountains which borders and frames the western side of the Mexican plateau. (See Mexico.) It may be regarded as a continuation of the mountains on the western border of the Great Salt Lake basin, and the name Sierra Madre is applied to it also in Southern Arizona. Entering Mexico near lon. 109° W. it separates Chihuahua from Sonora, occupies the western part of Durango, and is continued through Jalisco. On the eastern or plateau side the declivity is gentle, but the Pacific side is marked by steep slopes, numerous precipices, and magnificent scenery. Few of the peaks exceed 10,000 feet. The chain is much broken, and often there are several parallel ranges. In Jalisco, especially, the mountains are cut by deep cañons where rivers break through them. The higher slopes are covered with pine-forests. The Sierra Madre del Sur, in Southern Mexico (Guerrero, Oajaca), is an E. and W. range, parallel to and near the Pacific, and rising in parts to 10,000 feet; apparently it has no structural connection with the Sierra Madre del Pacifico. The mountains forming the eastern border of the plateau are sometimes called, collectively, the Sierra Madre del Oriente or Eastern Sierra Madre.

HERBERT H. SMITH.

**Sierra Morena, -mō-rā'nā:** a mountain range of Spain, separating the basin of the Guadiana from that of the Guadalquivir, and extending between lon. 3° and 4° W. Its aspect is generally rugged and somber; its highest peak is Aracena, about 5,500 feet high.

**Sierra Nevada** [Span., snowy mountains: *sierra*, saw, mountain range < Lat. *serra* + *neva* do, snowy, deriv. of *nieve*, snow < Lat. *niv*, *nivis*): a mountain range of Southern Spain, 75 miles long and 25 broad, between the Guadalquivir and the Mediterranean. Its highest peaks are Mulahacen, 11,658 feet, and Veleta, 11,387 feet, and it has received its name from its being covered on many of its peaks with perpetual snow and ice. Its southern slopes are clad with chestnut forests, olive and orange groves, and vineyards.

**Sierra Nevada:** a mountain range of Eastern California, separating the great valley of California from the interior basin of Nevada. The general trend is N. N. W. The range is continued at the N. by the Cascade Mountains, and at the S. turns S. W., uniting with the Coast Ranges. It is essentially a broad plateau inclined toward the W. except at the extreme N., where it divides into several ridges. The crest-line and highest peaks are along the eastern margin, and the eastern slope is steep. The long western slope is broken by deep cañons. Among its highest peaks are Dana (12,992), Lyell (13,042), Brewer (13,886), Tyndall (14,386), and Whitney (14,898), the loftiest point of the U. S. south of Alaska. The principal passes are Tehachapi (3,830), crossed by the Southern Pacific Railroad, Walker (5,320), Truckee (7,200), crossed by the Central Pacific Railroad, and Beckworth (5,190). The snowfall on the western slope is heavy, and the rivers nourished by its melting irrigate the Californian valley. The eastern slope is characterized by the arid climate of the interior basin. Among the higher peaks are a few small glaciers.

G. K. GILBERT.

Louis (1388) the Poles chose his younger daughter, Hedvig, queen, Charles Durazzo seized the regency in Hungary, and Maria was kept in captivity by John Horvath, ban of Croatia. Sigismund rescued and married her, and was crowned King of Hungary in 1387. He then undertook a war against the Turks, supported by the German and French chivalry, but was completely routed at Nicopolis (1396) by Bajazet, fled to Greece, and found, when in 1401 he returned to Hungary, his queen dead, his throne occupied by Ladislaus of Naples, and his brother deposed in Germany, and vindicating himself only with difficulty in Bohemia. In 1403 he expelled Ladislaus, and again took possession of the throne of Hungary, and in 1410 was even elected Emperor of Germany. In 1414 an oecumenical council was convoked at Constance in order to put an end to the schisms in the Church, and reconcile the Hussite party. He gave his assent to the decree of the council condemning Huss to be burned at the stake; and the Hussite war began. D. at Znaim, Moravia, Dec. 9, 1437. He was succeeded by his son-in-law, Albert II. of Hapsburg.

**Sigismund**: the name of three kings of Poland of the Jagellonian dynasty: SIGISMUND I., THE GREAT, b. in 1466, a son of Casimir IV., succeeded his brother Alexander on the Polish throne in 1507. His was probably the most successful reign in the history of Poland. A treaty with the Turks gave Poland the free navigation of the Black Sea, the sovereignty of Moldavia, and secured her against the invasions of the Mongols. He knew how to curb the arrogant nobility; was prudent in his expenses, and a patron of literature, which flourished highly under him and his son; and he favored the Reformation, which from Germany spread rapidly among the Poles. After the death of his first wife, Barbara Zapolska, he married Bona Sforza of Milan, an intriguing, avaricious, and licentious woman, who exercised great influence over him, and alienated to some extent the love of his subjects from him. D. Apr. 1, 1548, and was succeeded by his son, SIGISMUND II., AUGUSTUS, b. Aug. 1, 1520, who, although educated purposely by his mother in effeminacy and dissoluteness, opposed the ambitious schemes of the queen-dowager with great decision. At the Diet of Lublin (1569) Sigismund succeeded in uniting Lithuania firmly to Poland, and at the Diet of Warsaw (1572) he granted religious liberty, but the intolerance of the nobles prevented anything like freedom of worship to the serfs. Volhynia, the Ukraine, and Livonia were also incorporated, and his reign was, in both external and internal respects, a period of great prosperity. D. July 14, 1572, and with him the male line of the Jagellonian dynasty became extinct. His sister Catharine, however, who was married to John III., King of Sweden, had a son, Sigismund, who was elected King of Poland as SIGISMUND III. after the death of Stephen Báthori (1587), and was crowned at Cracow; but his only aim was to unite Sweden and Poland, in order to re-establish Roman Catholicism in the former and suppress the Reformation in the latter. In 1592 John III. died, and Sigismund succeeded him as King of Sweden, but in 1604 he was formally deposed by the Swedish estates, and his uncle, Charles IX., raised to the throne. Unwilling to give up his claims, he then began a long series of wars with Sweden which contributed much to the final ruin of Poland. D. at Warsaw, Apr. 30, 1632.

**Sigmaringen**: See HOHENZOLLERN.

**Sign** [viâ O. Fr. from Lat. *signum*, mark, sign, token; cf. SEAL]: in astronomy, a portion of the ecliptic, containing a twelfth part of the complete circle, or thirty degrees. The first sign begins at the point of the equator through which the sun passes at the time of the vernal equinox in the upper hemisphere; and the signs are counted onward, proceeding from W. to E., according to the annual course of the sun around the circle. The signs and their characters are as follows:

|                   |                         |  |
|-------------------|-------------------------|--|
| ♈. Aries, Ram.    | ♊. Libra, Balance.      |  |
| ♉. Taurus, Bull.  | ♋. Scorpio, Scorpion.   |  |
| ♊. Gemini, Twins. | ♌. Sagittarius, Archer. |  |
| ♋. Cancer, Crab.  | ♍. Capricornus, Goat.   |  |
| ♌. Leo, Lion.     | ♎. Aquarius, Waterman.  |  |
| ♍. Virgo, Virgin. | ♏. Pisces, Fishes.      |  |

The first character, ♈, indicates the horns of a ram; ♉, the head and horns of a bull; ♊, the ancient statues of Castor and Pollux; ♋, the claws of a crab; ♌, a corruption of the Greek letter Λ, initial of *Λέων*, lion; ♍, corruption of *ωπ* for *ωπέρων*, virgin; ♎, scales; ♏, the tail of a scorpion, or the legs and tail; ♐, an arrow; ♑, for *τρ*, initials of *τράγος*, goat; ♒, running water; ♓, two fishes joined. See ZODIAC.

**Sign**: in algebra, a symbol indicating a relation subsisting between two quantities, or an operation to be performed. Of the latter, those most commonly used are +, denoting addition; −, subtraction; ×, multiplication; ÷, division; √, square root; ∛, cube root; and  $\sqrt[n]{\phantom{x}}$ , nth root. The signs denoting relations are =, equal to; >, greater than; <, less than, etc.

**Signaling**: a means of transmitting intelligence to a distance by means of signals appealing to the sense of sight or of hearing. For army signaling, especially in the U. S., see SIGNAL SERVICE and HELIOTROPE, and for signaling at sea see the former article and FOG-SIGNALS, NAVAL SIGNALS, and ROAD, LAW OR RULE OF THE. Signaling is of great importance on railways, for which see RAILWAYS (*Signals and Interlocking*). Signals are also used to make announcements of weather predictions. (See WEATHER SIGNALS.) For the signals used before the invention of the electric telegraph to transmit messages to a great distance, see TELEGRAPH.

**Signal Service**: that branch of the public service of a country which is concerned with transmitting intelligence by means of signals, especially in the army and navy. Few persons without experience have any idea of the remarkable ranges at which signals made by motions are visible to the naked eye, or the wonderful gain had by the use of a simple pocket-telescope. Signaling at 5 miles is held by experienced signalists to be at very short range. Messages have been sent 10 miles by means of a pocket-handkerchief attached to a 12-foot rod. With the flags and staffs in use in the Signal Corps of the U. S. army communication is said to have been had at 25 miles' distance, and detached words are reported to have been read at a distance of 40 miles.

It is well known that the success of modern military operations depends very largely upon celerity of movement and the concentration of the largest force at a given point. The greatly increased accuracy and range of small-arms and artillery have made it imperatively necessary that there should be rapid and sure means of intercommunication between the various component parts of an army, and that there must be prompt transmission of information both on the march and on the field of battle. The conditions necessary to meet these requirements are well provided for by the Signal Corps of the U. S. army as at present organized. The system of military signals of which Maj. Albert J. Myer was the originator proved to be a great advance over the crude and unwieldy methods previously in use. Its value was speedily demonstrated by actual test almost immediately after the appointment of Myer as first signal officer of the army in 1860, and at the close of the civil war its usefulness as an auxiliary arm on the field of battle and on the march was not only recognized by giving it a place in the permanent military establishment, but the record which the corps made during the war has been utilized by the military powers, and the Myer system serves as a basis upon which rests modern military signaling. In Aug., 1861, a camp was formed at Georgetown, D. C., where signal-parties were instructed and equipped to attend each army that took the field; but it was not until Mar. 3, 1863, that the Signal Corps was given a separate and systematic organization. It was to consist of 1 colonel, 1 lieutenant-colonel, 2 majors, 1 captain, and 8 lieutenants for each army-corps, and for each officer there was allowed a sergeant and 6 privates. The corps was authorized for the duration of the civil war, and appointments were to be made on the recommendation of examining boards.

The Signal Corps served with the greatest efficiency on all fields during the civil war, and even on naval vessels, notably with Farragut in the fight at Mobile Bay. At the close of the war it was again reorganized. The act of July 28, 1866, provides that there should be one chief signal officer, with the rank of colonel, but it made no provision for a corps other than by a limited detail of six officers and not to exceed 100 men from the Engineer battalion. The school of instruction was established at Fort Whipple, now Fort Myer, Virginia, and here for many years signal instruction was given to officers of the army and the navy and to the enlisted men of the Signal Corps. In 1870 a meteorological division was added to the signal service, to provide for taking meteorological observations, with a view to giving notice by telegraph and signals of the approach and force of storms, and for twenty-one years this work formed a most important part of the duties of the service, gaining for it a worldwide reputation by the skill with which its weather forecasts were produced and their great reliability.

The equipment of the car consists of an aneroid barometer, prismatic compass, telescope, field-glasses, note-book and pencil, telephone, maps of the country, and a camera. The operator is thus fully prepared for photographic work and observation. It may be thought that a balloon would present a good target to the enemy, but the experiments at Shoeburyness with an old captive balloon showed that it is almost impossible to hit such an object with long-range musketry fire or by artillery fire, especially if it be kept moving, which it always would be.

The advantage that a force possessing a balloon-train has over a less-favored enemy is manifest. All the great nations have equipped their armies with captive balloon-trains,

FIG. 4.—Cipher disk.

Plan for service disks.

Vertical section exhibiting plan for four disks.

and the individual processes of manipulation are regarded as military secrets. The French claim to possess a dirigible balloon, and if its practicability be established the machine should prove a most powerful engine of war.

It will be seen from the foregoing that the system of signaling used in the U. S. army—which is practically the invention of one man, Gen. A. J. Myer—has developed into a military science. In most of the foreign armies the signal service has been dignified by a separate corps organization, and where not separately organized they form a distinct division of some corps already in existence, such as the engineer, and the practical exigencies of war have in war served to make them independent in all but name. In Great Britain the signaling operations are entirely under the jurisdiction of the Royal Engineers Telegraph Corps, which consists of 6 officers and 245 men. In the Austrian army this duty is performed by a regiment having charge of railways and telegraph. In the Russian army there are 7 field-telegraph boards, each board consisting of 3 divisions, with the strength of 1 officer and 38 men. In the German army there are 7 field and 4 semi-permanent telegraph divisions, each field division being composed of 4 officers and 148 men. Belgium, Holland, Spain, and Italy have all given special attention to the organization of telegraph and signal trains in connection with their military establishments.

In addition to the military telegraph lines under charge of the chief signal officer of the U. S. army, there are thirty-three military posts and stations whose telegraphic connections with the great commercial systems of the U. S. are over prominent lines, constructed and operated by the Signal Corps of the army. There is at present hardly a military post which has not a telegraph station either within its limits or at some convenient point speedy of access. In addition to the regular telegraph service attention is being given to suitable equipment of its flying telegraph-trains in all phases, from the connection, by means of such lines, of army headquarters with the permanent lines of the U. S., to the provision for temporary telegraphic or telephonic communication between army, division, or even brigade headquarters, with all essential points, whether in camp or on battle-line.

H. H. C. DUNWOODY.

**Signature:** in the old system of medicine, some physical peculiarity of a drug which was supposed to indicate its

use. Thus, because the euphrasy or eye-bright has a flower with an eye-like mark, it is good for the vision; the rock-liverwort was thought to be shaped like the liver, hence it is good for diseases of that organ. This belief prevailed not only among herbalists and pretenders, but among the best-trained physicians of the time.

**Sign-language:** See DEAF-MUTES.

**Signorelli**, scēn-yō-rel' lēe, LUCA: painter; b. at Cortona, Italy, about 1441; pupil of Piero della Francesca. In 1472 he was painting at Arezzo, in 1474 in Città di Castello. He afterward went to Rome, and in the Sistine chapel painted two frescoes representing incidents in the history of Moses. These were completed by 1484, when he returned to Cortona, and painted an altarpiece for the chapel of Sant' Onofrio in the Cathedral of Perugia. In 1490 he painted the *Circumcision* in the Church of San Francesco at Volterra and an altarpiece in the Duomo, and the next year returned to Cortona and took office as a councilor. The eight frescoes in Mont' Oliveto, near Sienna, were commissioned in 1497, but the greatest works of this master are the frescoes of the chapel of the Madonna di San Brizio in the Cathedral of Orvieto. These were undertaken after Signorelli's sixtieth year. The four great compositions with life-size figures represent *Antichrist, Hell, The Resurrection, and Paradise*. These, with the decorative designs around them, were all executed by Signorelli and his assistant Girolamo Genga within three years and three months. Signorelli painted innumerable altarpieces and frescoes besides the works mentioned. He signed his name in several manners: Lucas Signorellus Cortonensis, also in a Greek form, Λουκάς ὁ Κορνήσιος, also Lucas Coritius, also Lucas Aegidii Signorelli Cortonensis. He was the first of the whole cycle of Italian painters in his mastery of drawing the human figure, and of his use of it in his compositions for its own sake. His frescoes at Orvieto greatly impressed Michelangelo, whose *Last Judgment* testifies to the influence Signorelli had over him. Signorelli died at Cortona in 1523. He had lived there in splendor and luxury, more like a nobleman than a painter, according to Vasari. His son Antonio and his nephew Francesco Signorelli were painters also. Luca Signorelli is well represented in European galleries. For further information, see Vasari; Crowe and Cavalcaselle's *History of Painting in Italy* (1864-71); Robert Vischer, *Luca Signorelli* (Leipzig, 1879); and Kugler's *Handbook*, edited by Sir H. A. Layard (1887).

W. J. STILLMAN.

**Sigourney**: city; capital of Keokuk co., Ia.; on the Skunk river, and the Chi., Mil. and St. P. and the Chi., Rock Is. and Pac. railways; 25 miles E. of Oskaloosa, 28 miles W. of Washington (for location, see map of Iowa, ref. 6-1). It is in a coal-mining region, has important manufactories, and contains a public high school, a national bank with capital of \$50,000, 2 State banks with combined capital of \$100,000, and a monthly and 3 weekly periodicals. Pop. (1880) 1,735; (1890) 1,523.

**Sigourney**, LYDIA HOWARD (*Huntley*): poet; b. at Norwich, Conn., Sept. 1, 1791; established a select school for young ladies at Norwich 1809, and at Hartford 1814; published a volume of *Moral Pieces in Prose and Verse* (1815), and was thenceforth through a long life one of the most popular of American poets. She published fifty-nine volumes of poems, essays, and letters, chiefly on moral or religious themes. She married Charles Sigourney, a merchant at Hartford, in 1819; visited Europe 1840; d. at Hartford, June 10, 1865. Among her works were *Letters to Young Ladies* (1833); *Zinzendorf, and other Poems* (1835); *Lacandonas, and other Poems* (1841); *Pleasant Memories of Foreign Lands* (1842); *Past Meridian* (1854); and a posthumous autobiography, *Letters of Life* (1866). Two volumes of her selected poems appeared in London 1841, and a choice edition, illustrated by Darley, was published at New York 1848.

Revised by H. A. BEERS.

**Sigwart**, CHRISTOPH, von, Ph. D., Dr. Theol., LL. D.; b. at Tübingen, Württemberg, Mar. 28, 1830; educated there and became professor in a seminary 1859 and Professor of Philosophy in the University of Tübingen 1863. He is a corresponding member of the Academy of Sciences of Berlin. His principal works are *Spinozas neuentdeckter Tractat von Gott, etc., erläutert* (1866); *Logic* (vol. i., 1873; vol. ii., 1878; 2d ed. vol. i., 1889; vol. ii., 1893; English translation 1894); *Vorfragen der Ethik* (1886); *Die Impersonalien, Eine logische Untersuchung* (1888).

J. M. B.

**Sihon**, or **Sihun**: See SYR-DARYA.

lead, copper, and coal being abundant. Pop. (1890) 4,224,458. Capital, Breslau.

Silesia was from the sixth century inhabited partly by German, partly by Slavonic tribes, and formed a fief or—as it was divided between several dukes—several fiefs, first of the Polish, then of the Bohemian crown. In 1537 the Duke of Liegnitz and the Elector of Brandenburg made an agreement that if either of the two reigning lines became extinct its possessions should fall to the other. In 1675 the ducal family died out, but the German emperor refused to acknowledge the validity of the agreement of 1537, and incorporated Liegnitz and the other ducal possessions as a lapsed fief of Bohemia into the Austrian empire. In 1740 the duchies were seized by Prussia. (See FREDERICK II. of Prussia and SEVEN YEARS' WAR.) Under the Prussian Government the province has developed greatly, and forms one of the richest provinces of the kingdom.

Revised by M. W. HARRINGTON.

**Silesia, Austrian:** province of Austria, between Prussia, Moravia, and Galicia. Area, 1,987 sq. miles. The northern part is covered by the Sudetic Mountains; the rest is flat, though high. The climate is somewhat rigorous, but healthful. Good crops of rye, barley, and oats are raised, cattle, sheep, and bees are extensively reared, and copper, lead, iron, and coal are mined. Pop. (1891) 605,649, of whom four-fifths are Roman Catholics. Capital, Troppau. M. W. H.

**Silhouette** [from Étienne de Silhouette, French Minister of Finance in 1759, either because of his excessive public economy, causing his name to be applied to things cheap, or because of his making such figures as a diversion]: a figure drawn in outline and filled in solid, usually with black, without other details than those of the outline; much like a shadow. By extension the term is used when there is some slight delineation of the parts within the bounding line.

**Sil'ica or Silicic Acid** [*silica* is Mod. Lat., from Lat. *sil'ix*, *sil'icis*, flint]: a compound ( $\text{SiO}_2$ ) of SILICON (*q. v.*) with oxygen. It was first pointed out by Smithson in 1811 that this substance is a weak acid, and shortly afterward Berzelius showed that it is one of the most important and widely distributed acids of the mineral kingdom. It occurs in nature partly free, partly in combination in the silicates. Free silica is either crystallized or amorphous. The crystallized varieties contain no water, have the specific gravity 2.66 or 2.3 according to the form, and are insoluble or difficultly soluble in alkalis. The amorphous varieties contain water, have the specific gravity 2.1 to 2.2, and are dissolved by alkalis. The principal form in which silica occurs is QUARTZ (*q. v.*).

Tridymite crystallizes in the same system as quartz, but has a lower specific gravity, 2.3, and constitutes an undoubted allotropic form of silica. It was discovered by von Rath.

**Amorphous Forms of Silica.**—Silica when precipitated from solution, and when fused, as with the oxyhydrogen flame, assumes the density 2.225, and in this form is highly soluble in caustic alkalis—to a small extent in many saline solutions, and even in pure water. This is the form in which silica is left in the decomposition of many natural silicates by alkaline waters, and it is therefore present in most soils. All amorphous varieties of mineral silica are called opal. Among these are OPAL and HYALITE (*q. v.*). Mixtures of the crystallized and amorphous varieties of silica also occur in nature. Among these are AGATE, CHALCEDONY, CHERT, FLINT, and CARNELIAN (*q. v.*). An analysis of a very pure opal by von Rath gives the formula  $3\text{SiO}_2 \cdot \text{H}_2\text{O}$ , with the density 1.99, corresponding to 9.84 per cent. of water. Some of these hydrates, however, contain as much as 13, 16, and even 21 per cent. of water, and some opals as low as 5 or 6 per cent. only. This indefinite character of opal is probably due sometimes to admixture with quartz or other forms of silica, a variable insoluble residue being generally left on boiling with an alkali.

The relations of silica to life upon the land are very important. Of the animal kingdom it is but a very trifling constituent, but to many plants silica has the same relation that tricalcic phosphate has to most animals—that is, silica is the main material of the plant-skeleton. Of the ashes of plant-stems, particularly, silica is often found to be a large constituent; thus in ash of rye-straw is found 65 per cent., of potato-stems 36 per cent., and of wheat-straw as much as 73 per cent. Hence the importance of the existence in soils of silica in such form that it may pass in solution into the roots—namely, in the form of soluble silica, or more probably that of hydrated silica.

Silicic hydrates may be obtained artificially by several methods. If solutions of soluble glass (see GLASS) are treated with acids, hydrate of silica precipitates in gelatinous form. This, if well washed and dried over oil of vitriol, gives, according to Doveri, a product of the composition  $3\text{SiO}_2 \cdot 2\text{H}_2\text{O}$ , which was converted at  $212^\circ \text{F.}$  into  $3\text{SiO}_2 \cdot \text{H}_2\text{O}$ , the same as von Rath's native opal, referred to above. Hydrates may also be obtained by the action of the gaseous fluoride of silicon on water. Fuchs obtained thus the above trisilicic monohydrate, and another, a tetrasilicic monohydrate ( $4\text{SiO}_2 \cdot \text{H}_2\text{O}$ ). Ebelman also obtained a definite hydrate ( $2\text{SiO}_2 \cdot 3\text{H}_2\text{O}$ ) as a transparent solid glass by the action of air upon silicic ether. By DIALYSIS (*q. v.*) Graham obtained a solution of 5 per cent. of silica in pure water, which may be boiled rapidly down to 14 per cent. if no gelatinization is allowed on the edges. This solution is tasteless, with a feeble acid reaction. In the course of a few days it passes spontaneously into a transparent jelly. Addition of a little muriatic acid or an alkali tends to preserve it. Carbonic acid coagulates it, also alkaline and earthy carbonates in minute proportion. Added to a solution of gelatin, this precipitates, together with the silica, about in equal parts. This solution evaporates to a lustrous transparent glass of composition  $\text{SiO}_2 \cdot \text{H}_2\text{O}$ , containing 22 per cent.  $\text{H}_2\text{O}$ .

**Silicate Cotton:** See MINERAL WOOL.

**Silicide of Carbon:** a very hard crystalline substance first obtained about the year 1890 by E. G. Acheson, of Chicago, while experimenting for the production of diamonds in the electric furnace. Under the supposition that he had formed a compound of carbon and corundum, he gave it the name "carborundum," by which it is commercially known. Chemical analysis, however, shows that it has the following composition: Silicon, 69.10; carbon, 30.20; with about seven-tenths of 1 per cent. of oxide of iron, alumina, and lime, which may be regarded as impurities and as imparting color, which varies from nearly white to a deep emerald green and blue. The composition may thus be expressed by  $\text{SiC}$ , the elements being united atom to atom.

The crystallization is rhombohedral, usually with a broad development of the basal plane, forming hexagonal plates confusedly aggregated and very small, but with brilliant surfaces, an adamantine luster, and transparent. Specific gravity about 3. It is a good conductor of heat, is not fusible before the blowpipe, and is insoluble in acids.

The most important physical characteristic, industrially, is its extreme hardness, which appears to be between that of the sapphire, which it scratches, and the diamond. It is used as a substitute for emery or corundum, and is made into wheels, whetstones, and polishing-cloths. It is manufactured by exposing a mixture of sand and carbon to the heat of a powerful electric current for eight hours. The result is a mass of crystals of small size, which is crushed and the powder digested with dilute sulphuric acid to remove soluble impurities.

See Acheson, *Carborundum, its History, Manufacture, and Uses*, in *Jour. Frank. Inst.* (Philadelphia, Sept., 1893); Schützenberger, *Contribution to the History of Carbosilicous Compounds* (*Comptes Rendus*, May, 1892); *Carborundum, etc.*, *The Electrical Engineer*, xv., p. 227 (Mar., 1893); *Science*, xxii., 141 (Sept. 15, 1893).

W. P. BLAKE.

**Sil'icon** [Mod. Lat., from Lat. *sil'ix*, *sil'icis*, flint]: an element which, next to oxygen, is the most abundant one in the solid part of the earth's crust. Quartz, sandstones, and other forms of SILICA (*q. v.*) contain over 45 per cent. of their weight of silicon. Granite and gneiss-rocks average 35 per cent. of silicon, slates 30 per cent., and trap-rocks 23 per cent. Silicon was first obtained by Berzelius in 1823 from the silicofluoride of potassium by the action of fused potassium thereon. It appears, when thus obtained, as an amorphous powder of a dull-brown color, which smears the fingers like lampblack. It does not conduct electricity; is not acted on by mineral acids, except hydrofluoric, but dissolved by potash solution. Heated in air or oxygen, it burns brilliantly, forming silica,  $\text{SiO}_2$ . Silicon may be obtained in this form also by the action of potassium or sodium on gaseous fluoride or vaporous chloride of silicon; also by the electrolysis of fused silicofluorides, and by heating sand (silica) with metallic magnesium. A second allotropic form of silicon is obtained by exposure of the above to strong heat, which causes it to become denser and pass into graphitoid silicon. This form was obtained in hexagonal tabular crystals by Wöhler by fusing silicofluoride

combined with an excess of metallic aluminum and the two metals combining and the aluminum from the mixture having combined with acids. Most of the silicate minerals, and, on cooling, the silica crystallizes out of solution. The preservation of such formed species is usually caused by heating to a high temperature a solution of silicic acid of potash, soda, sodium, and ammonium ions. After the fusion, superheating heat the gas evolved by hydrofluoric acid and the crystals of silicon is obtained. This form of silicon is also obtained by passing a stream of chlorine over iron filings. Another form of fused silicon which was obtained by heating potassium above the melting point of steel. This carbon containing and boronated in its structure. Dioxide and oxygen obtained and impurities weighing nearly a percent. In the combustion of it and burning with oxygen gas of a white flame.

The allotropic forms of silicon offer a remarkable parallelism with those of carbon, and indeed, there are no known of such widely different elements in nature which formed so many analogies in carbon, and silicon the first being a classical representation of the organic kingdom and the rest of the inorganic. Silicon is more chemically positive than carbon, at least at high temperatures, and is more dissimilar potassium carbonate when fused with it, forming a glassy mass, with vivid transparency, potassium carbonate being fused. It is therefore more powerful agent in dissolving substances than carbon, and if it were cheaply available would have valuable practical applications in the arts. Silicon combines with iron at high temperatures, and the resulting compound is. Revised by J. A. HANSEN.

**Silistra** (anc. *Prosedonopolis*; town in Bulgaria) on the Danube, about 20 miles N. W. of Varna (see map of Turkey, vol. 1, p. 17). Known as a large trade in wheat and lumber, it is especially important as one of the strongest fortresses in the country. Until the construction of the Russo-Turkish war, 1877-8, it was for almost four years the main link of the Ottoman empire on its northern European frontier. The Russians besieged it in vain in 1773, 1810, and 1860, in 1878, 20,000 Ottomans withstood for months the whole army of Marshal Plevna; but July 1 the town was forced to surrender, and the fortifications were demolished. Though it was occupied by the Russians in 1877-78, the demolition of its principal arsenal, Arab-Taban, was one of the stipulations of the Convention of Berlin, 1878. Pop. (1884) 11,710 (including 6,000 S. L. from Silistra the treaty of Kaimakli, signed April 21, 1874) the conditions of which were the most disadvantageous up to that time imposed on the Ottomans except.

J. A. HANSEN.

**Silvanus Halpinus**, poet, full name Titinius Varus Silvanus Halpinus, which is found only in the inscription (see p. 17, 1884). Born in 25 A. D., at what place it is unknown, he acquired some reputation as a plebeian at the age of 18 and was prosecuted in A. D. probably in 40 A. D. Possessed of ample means, he purchased numerous slaves, including one that had been *Christi*, filled his house with books and works of art, and devoted himself to literature and philosophy. The latter part of his life was spent in retirement on the Campanian slope, near the tomb of Virgil at Brundisium, as well as at Ostia; he was an ardent athlete. Among his friends were the Stoics Epictetus and Musonius, and he lived his life in tranquil fashion by voluntary abstention in 101, being afflicted with an incurable illness.

His epic poems, entitled *Parasce*, in seventeen books, is the history of the Roman empire, and also the fullest existing epic in existence. They were more industry than talent. The first part of the second Virgil war, and the two great heroes are *Scipio* and *Horatius*. *Levi* is his principal source for the *Levi* and *Virgil* for the philosophy, while various incidents are introduced from *Virgil*. Homer, *On the Silvanus* has been translated and has been seldom edited. The best edition is given by H. B. Hall, ed. 1880, 1881. Of numerous poems only to mention that of *Rosetta* (2 vols., London, 1880-81). Another work, entitled *Horatius* (1 vol., London, 1880), is a history of the *Levi*, in 1870, mentioned in generally admitted to 1870, and was probably composed at a much earlier period than the *Parasce*, and is the best of the two. As the beginning and end of the *Parasce*, *Virgil* is known. This has been edited by P. B. Hall, ed. 1881. See also R. Hall, ed. 1881. *Horatius* (1 vol., London, 1881) and *Levi* (1 vol., London, 1881) are the best of the two. M. W. HANSEN.

**Silk** (or *sericiculture*; also in some shells, *Murex* and *Argo*, and obtained from a different source from *Trichia*, which is the soft, strong, smooth, and lustrous filament in their possession of the form of certain filamentous bodies which having the function of the *Trichia*, *Murex*, and other forms, and are known as silk. The *Trichia* is also applied to the textile fabric woven from these filaments in threads. The term silk is the product of the *Trichia*, more or less of proper, which forms on the *Trichia*. Some of the other varieties of silkenness which are found in a wild state, yielding what is commonly known as wild silk, a rather coarse filament possessing few of the properties of the mulberry-silk. Tussah silk, produced by the caterpillar of the *Trichia*, is woven by the natives of India and China into a cloth of primitive make, and of late years, owing to the improvements made in the mode of rearing it and depositing it of its grain, it has found a more extended consumption in Europe. The extreme fineness of silk adapts it for articles in which appearance has to be combined with lightness and durability. So great is the fineness of the thread formed in the cocoon that several of them have to be reeled together into a single thread. This fineness varies, even in the same cocoon, and reaches as low as that of an inch in diameter, while the length of the whole cocoon is very great compared with its weight, exceeding 1,000,000 yards to the pound.

**Preparation of Silk**—The operation which the full-grown silkworm enters on, and through two separate such tubes which terminate in the form of a "spinner" under its lower lip. The cocoon is formed in six or eight days, and in about three weeks the worm emerges all the *Trichia* and *Trichia* are reeled and finally. The last cocoon is carefully selected and retained for use, i. e. for the reeling of the *Trichia*, which are to lay the eggs for the following year. The *Trichia* in the other cocoons have to be killed in order to prevent the hatching of the *Trichia* by the moth, which would make it unfit for reeling. The reeling of the *Trichia* can be accomplished in various ways, with damp air or with dry air, by steam, and by exposure to the hot sun. It has also been attempted with carbonic acid, sulphur fumes, etc. The cocoons are then ready for reeling, and have to be separated in groups in order to obtain as much uniformity as possible in color and quality of the silk to be reeled. Several cocoons and others having imperfections are grouped separately. Before reeling the cocoons are cleaned by removing the frame which the worm built, by late boiling it with the alkaline fiber, and which is the fiber of the *Trichia*. The reeling has to be done very carefully, and female labor is mostly employed in doing it. The value of the product, its fineness, its uniformity, are all dependent on good reeling. While the filament in the cocoon is a continuous and independent thread, the *Trichia* or growing substance which makes the cocoon a kind of homogeneous mass has to be softened or dissolved in order to permit of the free unwinding of the cocoon in thread. The reeling of the silk is done while the cocoons float in a pan of hot water the temperature of which is between 104° F. and the boiling-point, the spinner touching them lightly with a small brush in order to find the end of the threads that have to be spun together. According to the thickness of the silk to be obtained from two to six cocoons or more are reeled together into a single thread. Attached to these threads is still sufficient of the gum to cause them to be glued together with a slight pressure of the fingers and a light twist. The combined thread is then carried on to the reel. New cocoons have to be taken and their ends joined to the continuous thread when the first cocoons give out or cease to spin. The thread produced by reeling is known as *raw silk*, and comes in commerce in large skeins or battes.

**Prepared Materials producing Silk only**—These are India and France in Europe; China, Japan, India, and Assam in Turkey in Asia. Silk is also produced in Spain, Austria, Hungary, Greece, European Turkey, Russia, Persia, Central Asia, etc., but on a smaller scale than in the countries first named. Notwithstanding all the efforts made to introduce sericulture in the U. S., very little raw silk is produced there at present. The opening up to commerce of the parts of the Far East greatly increased the supply of raw silk available for Europe and America, and as the supply has been increasing at a steadily increasing rate, there has been a tendency toward a lower level of prices. The production of raw silk of the world in 1884 and 1885 was estimated to have averaged about 30,000,000 lb. per annum. Of this China and Japan supplied more than half. They produce

about one-sixth of the entire world's supply, France much less. Raw silk is graded in regard to its commercial value; French and Italian is the higher priced, that produced in Asiatic Turkey, Japan, and that part of China known as the Canton district follows, and common China silk shipped through Shanghai represents the inferior grade.

**Conditioning.**—The raw silk reeled in Japan and China on the European system is classified as filature. Native-reeled silk can be reeled; these are known as *recreels*. The fineness of raw silk is expressed by a number, which indicates the weight for a certain number of yards. This weight is expressed in *deniers* (old style *pennyweight*), and is called its *titre* (French, *titre*; Italian, *titolo*). Of this there are several standards, the most used being the Milan legal standard and the Lyons standard, the first numbering 1 for each unity of weight of  $\frac{1}{5}$  decigram for 450 meters, while the Lyons standard, which is also known as the international, numbers the same unity of weight for every 500 meters. As, however, uniformity in fineness is not obtainable, the "number" of raw silk is usually expressed between limits. Thus if raw silk is numbered 9/11 deniers, it means that for every unity of length it weighs between 9 and 11 times the unity of weight, averaging 10 deniers. A scientific method of assaying silk has been found necessary, in order to establish its title, the amount of moisture it contains, etc. This is commonly called conditioning. Nearly every European city in the industries of which silk plays any part has a conditioning establishment. A certificate is given for each separate parcel, which gives it a sort of legal status, and is sufficient for commercial purposes. Nearly all the silk exported to the U. S. from Europe is accompanied by a certificate of conditioning, while much of the Asiatic silk imported is conditioned in the U. S.

**Waste Silk.**—Under this general name may be included everything that in the course of the manufacture, from the cocoon to the finished fabric, is eliminated through one reason or another. This includes the pierced cocoons which have been used for seed, and all others that are unadapted for reeling. In reeling the raw silk only about 70 per cent. of the silk in the cocoon is utilized, the rest going as waste. Waste is also made at every subsequent process of manufacture. All this waste is the raw material for a subsidiary but important industry, that of making the yarn that is commonly called spun silk, which can be used for many purposes, as it possesses all the luster of silk. Spun silk is used as filling in silk fabrics; it can be used in combination with wool, cotton, and other fibers, in mixed goods. Spun silk is also much used in the manufacture of velvets and plushes.

**Treatment of Raw Silk.**—Raw silk has to be thrown before it becomes fit for further process of manufacture. Only for a few special tissues can it be woven as it is. The throwing consists in twisting several threads into one thicker thread. It includes various operations, such as reeling, doubling, cleaning, spinning, doubling again, twisting, and, if the silk has to be dyed, reeling again into skeins. Thrown silk is known as *tram* if to be used for the filling and as *organzine* if to be used for the warp. The tram, being less exposed to friction and to rough handling during the weaving, is less strong than the organzine; it has a smaller number of raw silk threads, and is given less twist in the throwing than is the case with organzine.

**Boiling and Dyeing.**—Combined with the silk is always present a certain amount of gum, which to some extent impairs its brilliancy. This can be eliminated by boiling the silk with soap, the operation being called "boiling off." Boiled silk is as near as possible the purest silk obtainable for commercial purposes. The loss in weight caused by the boiling may be as high as 25 per cent., but there is a proportionate gain in the brilliancy of the fiber. Boiled silk is used in the richer tissues, in which great luster has to be combined with strength and softness of the fiber. For some tissues only a partial boiling is necessary, while for others all the original stiffness of the fiber is required. The operation of boiling usually precedes the dyeing. The dyeing of silk is a very delicate operation, and while the desired shade has to be produced on the fiber, this must not lose its brilliancy. Silk takes the dye as easily as wool, and more readily than any of the vegetable fibers. Silk can also be bleached by being exposed to the action of sulphur fumes. The loss in weight which silk sustains through the boiling can be regained in the operation of dyeing. The dyer can even increase the weight of the silk by what is called loading, but the increase in weight is often obtained at the expense of the strength of the fiber. This operation is based

on the property possessed by silk of absorbing and retaining other substances. The substances available are white sugar, tannic acid, compounds of tin, lead, iron, and other metals. The excessive loading of silk is intended to deceive the consumer, and such addition is extensively made to black silks, the *charge* sometimes more than doubling the weight. Silk that is not loaded is commonly known as pure dye. The silk is usually dyed in the skeins before being woven. The tissues can be dyed after they have been woven, but usually only the lower-priced and lighter tissues are so treated. The operation is called piece-dyeing, as distinguished from skein or yarn dyeing.

**Fabrics of Silk.**—The natural qualities of silk make it possible to obtain with this fiber greater diversification in the tissues that can be woven with it than is the case with any other fiber. The weaving is preceded by the operations of winding, spooling, warping, etc., which make the yarn ready for the loom. Improvements in machinery have made it possible to weave almost any fabrics on power-looms, and the greater proportion of the silk tissues now produced are so woven, although some of the richer fabrics require so much care that they can be produced only on hand-looms. In the U. S. the looms are nearly all driven by power, but in Europe there are still many hand-looms. Tissues can be classified into two distinct families. Plain tissues are in one color only, and show no elaborate pattern, the variety in them being obtained by the different arrangement of the warp and filling threads as regards each other. Fancy tissues include all those in the making of which enter more than one color, all figured tissues that show a design. When one color is used for the warp and another for the filling in a plain tissue, the two colors combine, producing a peculiar effect of reflex, known as *changement* (French, *glacé*). Plain silk cloth can be embossed, producing figures in relief; for this purpose only the lighter silk tissues are used. Another peculiar effect that can be produced on silk fabrics, and which is commonly called *moiré*, is obtained by exerting strong pressure on the surface of a grained silk fabric (*gros-grain*) which becomes flattened at certain spots, producing a design. In the weaving of tissues various kinds of raw silk are employed, according to the cloth that has to be woven. The sort of warp that is used for some fabrics is not suitable for others, and the number of twists per yard of length which have to be given to the organzine also varies. In the tissues produced the weave varies according to the position of the single warp and filling threads relatively to each other. Satin has a smooth surface, formed by well-twisted warp threads. Taffeta is relatively light tissue, plainly woven. Pongee is still lighter, and was first imported from China; it is woven in the U. S. and Europe in several varieties, known under different names. The Japanese export large quantities of light silk fabrics, which are known as *habutae* and *kaiki*. Grained surfaces are represented by *gros-grain* and other tissues. A good *gros-grain* has to be carefully woven to insure the regularity of the grain. *Surah* represents the twilled weaves. Ribbed fabrics are also plentiful in silk goods, and are known under various names, according to the thickness of the ribs. Tulle, gauze, grènadine, and veil are transparent fabrics, the weaving of which requires special care, and the threads for which have to be specially thrown, as some of these require thread more twisted than is the case with other goods. Under the name of *armures* are known fancy weaves, which show a special effect or design, usually very small, and formed by the threads themselves without the aid of a change in color. Damask, brocade, and damassé are figured fabrics in which a design is produced while they are being woven. Silk can be woven alone and in combination with other fibers. Good wearable tissues are obtained by weaving together silk and wool. Some dress fabrics are made with silk warp and wool filling. Others have wool warp and silk filling. The principal representative of these is bengaline, which is a silk and wool poplin. To the bengaline family also belong crystal weaves, being large fancy ribbed goods in silk and wool mixtures. Other silk and wool mixtures, known under the names of Ottoman and others, show more or less large ribs, and are principally used for cloaking purposes. Silks also much used in combination with cotton for making cheaper goods, which are used for linings, for umbrellas, and other purposes. The cheaper satins are made of silk and cotton, and are known as cotton-back satins (the silk showing on the satin face, the cotton on the back) to distinguish them from the all-silk satins.

from Spain, but were superseded by Greek silk-weavers whom Roger, King of Sicily, had brought as captives from Corinth, Thebes, and Athens to his own island. Some of these early silks surpass in beauty any of the productions of the manufacturers of modern times. In another hundred years the manufacture of silk had extended to Lucca, and thence, about sixty years later, to Venice, Florence, Milan, Genoa, and Bologna. The manufacture of silk goods was brought from Lucca to Lyons probably as early as the fifteenth century, but it made little progress until silk-culture and the production of the cocoons and raw silk were established at the beginning of the seventeenth century. In England the manufacture had made a little progress in the fifteenth and sixteenth centuries, but all attempts at silk-culture had failed. In Austria, Germany, Switzerland, and the Netherlands there were manufactories of silk, but very little silk was grown.

**In America.**—The first attempts to introduce silk-culture into America were made very early. James I. having been foiled in his efforts to establish the rearing of silkworms in England, and having learned that the climate of Virginia was favorable for silk-culture, sent over, in 1622, silkworm eggs, white mulberry-trees, and some printed instructions. Large bounties were offered for the production of raw silk, and fines were imposed on every planter who failed to plant a certain number of mulberry-trees, but the enterprise was neglected by the company and thrown upon the planters before it was fully established, and hence failed. Some silk was exported to England for several years, but after a time the attention of the planters was turned wholly to tobacco. At the time when the colonies of Georgia and the Carolinas were founded, the effort was made to revive the culture of silk there, and under vigorous protection and encouragement from England it was for a period of perhaps twenty-five or thirty years very successful. The first shipment of silk from Georgia consisted of 8 lb., and was made in 1735. From this small beginning there was a steady increase to 1759 or 1760. After 1760 the culture of silk declined; probably the next year's yield was not more than \$80,000.

The culture was not attempted in Connecticut till about 1760, but it was carried on there more persistently and extensively than anywhere else in North America. For many years the silk produced in Connecticut amounted to \$100,000 or \$200,000 per annum, but was seldom exported, being mostly made up into sewing-silk and into woven fabrics by home manufacture. The rearing of silkworms was also attempted with some success from 1869 to 1875 in Pennsylvania, New Jersey, New York, Rhode Island, and Massachusetts. In most of these States it had been given up during the Revolutionary war, and was not revived again till about 1835 or 1836. New machinery for reeling, throwing, and weaving silk was invented and put into operation; and as the supply of American-grown silk was not sufficient to meet the demand, a moderate quantity was imported. But the imports of manufactured silks continued to increase. The history of silk-culture in the U. S. has been one of ceaseless efforts toward a goal that has not yet been reached. Silk-manufacture, however, has developed into a staple industry. In 1830 an effort was made to introduce the so-called Chinese mulberry (*Morus multicaulis*) in the place of the white mulberry (*Morus alba*) on which the silkworms had been fed hitherto. Speculation came in and in 1839 twigs of the *Morus multicaulis* less than 2 feet in length and of the size of a pipe-stem were sold for \$2, \$3, or \$5. In the autumn of 1839 the bubble burst, ruining thousands. In 1844 a severe winter destroyed most of the trees, and blighted in the Northern States generally the white mulberry; and for the second time the rearing of silkworms was practically abandoned in the U. S.

Yet great good resulted, in the end, from this apparent disaster. The men who had devoted so much attention to silk-culture, finding the rearing of silkworms unprofitable, turned their energies to the manufacture of silk. From the beginning of the nineteenth century there had been some importation of raw silk, mostly for the fringe and dress-trimming manufacturers, and to some extent also for exportation; in some years it had amounted to \$100,000, \$200,000, and in one year to \$600,000. As yet there was little done save in sewing-silks, dress-trimmings, and a few styles of ribbons; but in the next decade (1850-60) the demand for sewing-machine silk and twist began to increase, and by this time it was found that the best brands of American sewing-silks fulfilled all requirements in quality, evenness,

strength, and color. Pongees, Japanese silks, and other mixed goods were made of as good quality as the imported handkerchiefs, ribbons, and a few pieces of broad goods were put upon the markets, and were creating a demand for more. After years of experiment the spun silks made from silk waste, pierced cocoons, etc., were coming into use, and greatly reducing the cost of those goods of which they could form a part. As yet (in 1860) American silk-manufacturers had received no protection or aid from the Government; but in 1861 the exigencies required the raising of a large revenue, and a duty of 40 per cent. *ad valorem*, which was afterward raised to 60 per cent., was imposed on manufactured silk, while raw silk was admitted free. In 1840 some machinery was taken from Connecticut to Paterson, and gave rise to an industry that has been steadily growing and has caused Paterson to be called the Lyons of America, since it is the principal silk-manufacturing center in the U. S.

In the U. S. nearly everything that is known in the line of silk-manufactures can be produced, although foreign goods find a market either on account of their novelty, as Europe retains the supremacy in designing and in fashion, or because the lower wages paid in other countries enable foreign manufacturers to sell some lines of goods cheaper than they can be produced in the U. S., notwithstanding the import duty.

SILK INDUSTRY IN THE U. S., CENSUS OF 1890.

| STATES.               | Estab-lish-ments. | Capital.     | Average number of hands employed. | Wages paid during the year. | Net value of finished goods. |
|-----------------------|-------------------|--------------|-----------------------------------|-----------------------------|------------------------------|
| California.....       | 9                 | \$112,288    | 214                               | \$83,566                    | \$266,712                    |
| Connecticut.....      | 35                | 9,087,042    | 5,081                             | 2,008,804                   | 8,122,761                    |
| Illinois.....         | 10                | 422,096      | 805                               | 285,636                     | 78,845                       |
| Maryland.....         | 4                 | 50,400       | 75                                | 24,238                      | 100,000                      |
| Massachusetts.....    | 20                | 3,353,296    | 3,216                             | 1,296,399                   | 4,611,000                    |

| New York.....         | 185               | 11,165,918   | 13,151                            | 5,584,399                   | 17,720,000                   |
| Ohio.....             | 3                 | 37,830       | 40                                | 13,685                      | 50,000                       |
| Pennsylvania.....     | 66                | 9,362,063    | 9,522                             | 2,961,334                   | 11,340,000                   |
| Rhode Island.....     | 3                 | 122,256      | 194                               | 61,978                      | 100,000                      |
| All other States..... | 5                 | 534,426      | 698                               | 156,104                     | 551,114                      |
| Totals.....           | 472               | \$61,007,537 | 50,913                            | \$19,680,318                | \$69,154,529                 |

The values of the principal items in the production, as given in the census of 1890, are: Ribbons, \$17,081,447; dress goods, figured and plain, \$15,183,134; machine twist and sewing-silk, \$7,068,213; upholstery goods, \$7,630,506; dress and cloak trimmings, \$4,403,757; tailors' linings, \$3,011,437; other broad goods, \$1,928,036; handkerchiefs, \$1,913,224; fringe, knitting, embroidery, and floss silk, \$1,849,631; hosiery and knit goods, \$1,150,172; velvets and plushes, \$3,141,026; braids and bindings, \$2,771,382; tie silks and scarfs, \$919,919; laces, \$261,750; military trimmings, \$232,600; other goods, \$602,330.

To meet the requirements of the increasing production of silk-manufactures the imports of raw silk in the U. S. have been increasing steadily. This progression is shown by the following table, giving the imports of raw silk in fiscal years:

| YEAR.     | Pounds.   | Value.     |
|-----------|-----------|------------|
| 1843..... | 17,894    | \$53,370   |
| 1850..... | * 190,010 | 401,785    |
| 1860..... | * 397,877 | 1,340,676  |
| 1870..... | 563,590   | 3,017,958  |
| 1880..... | 2,562,236 | 12,024,669 |
| 1885..... | 3,424,076 | 12,421,778 |
| 1890..... | 5,943,366 | 23,285,059 |

\* Estimated from current prices.

**Artificial Silk.**—In 1888 public attention was called to a chemically prepared substance called artificial silk. This is a pure cellulose obtained by treating cotton or other fibers with acids; run through a fine funnel it can be formed into a filament that is almost as fine as silk, possesses all its brilliancy, and can be dyed very readily; it is, however, easily set on fire.

F. SANSONE.

**Silk-cotton:** the cottony down of many malvaceous trees of Africa, India, and South America, of the genera *Bombax*, *Eriodendron*, *Chorisia*, etc. *Eriodendron anfractuosum* is the common silk-cotton tree of the West Indies. The trees are mostly very large, with very soft wood.

**Silk, Vegetable:** See FIBER.

**Silkweed, or Milkweed:** a plant of the genus *Asclepias* (q. v.).

periments with the compound blowpipe, with which instrument he demonstrated the fusibility of several bodies never before fused; secured for Yale College the valuable mineralogical and geological cabinet of Col. George Gibbs 1812; founded in 1818 *The American Journal of Science and Arts*, of which he was sole editor until 1838, and senior editor, along with his son, 1838-46; was the first to notice and record the effect of a powerful battery in volatilizing carbon and transferring it from the positive to the negative pole in the state of vapor; was an eloquent lecturer in scientific topics before popular audiences, having been perhaps the first to give such courses in the principal cities of the U. S.; made a second visit to Europe 1851; resigned his professorship 1853, and was made professor emeritus, but at the request of his colleagues continued to lecture on geology until June, 1855, when he retired from active labors. D. at New Haven, Nov. 24, 1864. He was the author of *Journal of Travels in England* (New York, 2 vols., 1810; 2d ed. New Haven, 3 vols., 1820); *Elements of Chemistry* (1830); *A Narrative of a Visit to Europe* (2 vols., 1853); and several minor publications; he also edited Henry's *Chemistry* (1814) and Baskwell's *Introduction to Geology* (1829). An interesting *Life* was prepared from his MS. reminiscences, diaries, and correspondence, by Prof. G. P. Fisher (2 vols., New York, 1866).

**Silliman, BENJAMIN, M. D., LL. D.:** scientist; son of Benjamin Silliman, chemist; b. at New Haven, Conn., Dec. 4, 1816; graduated at Yale College 1837; became associate editor of Silliman's *Journal of Science* 1838, and associate proprietor (with Prof. James D. Dana) 1846; was an instructor in chemistry, mineralogy, and geology in Yale College 1838-46; became Professor of Applied Chemistry 1846, and successor to his father in the chair of Chemistry 1854, which position he held in the medical department till his death. In 1847, in connection with Prof. John P. Norton, he established the Yale Scientific School, which has since grown into the Sheffield Scientific School. He was also Professor of Medical Chemistry and Toxicology in the University of Louisville, Ky., 1849-54; visited Europe with his father in 1851; was a director in the departments of chemistry, mineralogy, and geology in the Crystal Palace world's fair at New York 1853, and prepared (with Charles R. Goodrich) *World of Science, Art, and Industry* (New York, 1853) and *Progress of Science and Mechanism* (1854), in which the results of the exhibition were recorded; was for many years secretary of the American Association for the Advancement of Science, in which capacity he edited the volumes of *Proceedings*; wrote *First Principles of Chemistry* (1846; revised ed. 1856); *Principles of Physics* (1858; revised ed. 1868); and *American Contributions to Chemistry* (1875); contributed many papers to scientific societies, besides the large number published in his own *Journal*; was a popular lecturer on scientific subjects. D. at New Haven, Jan. 14, 1885.

**Silo:** See ENSILAGE.

**Silo'am** [= Lat. = Gr. *Σιλωάμ*, from Heb. *Shiloh*, liter., a sending (of water), aqueduct; Arab. *Silwan*]: (1) a fountain and pool in Jerusalem, on the southern edge of Ophel, 1,708 feet S. S. W. of the Fountain of the Virgin, with which it is connected by a winding tunnel. The fountain proper, hewn out of solid rock, is about 6 feet wide. Like the Fountain of the Virgin, it is intermittent. The lower basin is 52 feet long, 18 broad, and 19 deep, but now holding only 3 or 4 feet of water. It was once arched over. Jewish writers say it furnished the water used in sacrifice on the last great day of the Feast of Tabernacles. Jesus alludes to the practice of sending a Levite with a golden pitcher to get it (John vii. 37-39). This most famous of all the pools in or about Jerusalem is mentioned only three times in the Bible (Isa. viii. 6; Neh. iii. 15; John ix. 7), but frequently by Josephus. In the tunnel alluded to, cut in the solid rock, there was discovered in the summer of 1880 a Hebrew inscription. Prof. A. H. Sayce made the first intelligible copy (Feb., 1881). It is thus translated by Canon S. R. Driver: "Behold the piercing through! And this was the manner of the piercing through: Whilst yet the miners were lifting up the pick, each towards his fellow, and whilst yet there were 3 cubits to be cut through, there was heard the voice of each calling to his fellow, for there was a fissure in the rock on the right hand. And on the day of the piercing thus the miners smote each so as to meet his fellow, pick against pick; and there flowed the water from the source to the pool, 1,200 cubits, and 100 cubits was the height of the rock over the head of the miners." (Heb. Text of the Books of Samuel, p. xvi.) This inscription is proof that the

excavation was begun at each end, probably simultaneously. The inscription is undated, but the shape of the letters apparently shows that it dates from at least Hezekiah's time, and it is certainly one of the oldest known Hebrew inscriptions. 2 Kings xx. 20, 2 Chron. xxxii. 30 may allude to the excavation. See the discussion by A. H. Sayce in *Records of the Past*, new series, i., 168, seq., and S. R. Driver, *l. c.*, pp. xiv., seq. In 1889 a second conduit, some 20 feet below the ground, was discovered leading from the Pool of Siloam to another reservoir which once existed below. To it Isa. vi. 6 is supposed to refer. It was to Siloam that Jesus once sent a blind man to wash (Luke iv. 18). (2) The name of a little straggling, dirty village occupying an old quarry on the east side of the Kedron, overlooking the Pool of Siloam. SAMUEL MACAULEY JACKSON.

**Sil'phium** [Mod. Lat., from Lat. *sil'phium* = Gr. *σίλφιον*, an umbelliferous resin-bearing plant, perhaps the *asafoetida*], a genus of perennial plants of the family *Compositae*, comprising twenty species, many of which are found in abundance in the U. S. on the prairies and in the Southern States, also in other parts of North America. They are very hardy and coarse, bear large flower-heads, and exude a plentiful resin-like juice, whence the commonest species (*S. laciniatum*) has received the name of rosin-weed. The stem sometimes exceeds 10 feet in height. Both the resin and the leaves are much employed by farriers for asthma in horses, and a tincture has sometimes been found useful as a tonic and diaphoretic. This species is known by the names of COMPASS-PLANT (*q. v.*), pilot-weed, and polar-plant, from the fact that its leaves have a tendency to stand with one surface facing the E. and the other the W.; the plane of the leaf, which is usually vertical, is thus N. and S. The prairie burdock (*S. ~~rebinthinaceum~~*) and the singular cup-plant (*S. ~~perfoliatum~~*) belong to this genus. Revised by CHARLES E. BESSEY.

(Compass-plant (much reduced).)

**Silurian Period** [*Siluria* is from Lat. *Silures*, name of a people in ancient Britain]: the division of geological time preceded by the Cambrian period and followed by the Devonian. The name was first applied by Murchison to a rock series occurring in England and Wales in a district formerly occupied by the Silures. In the original description of Silurian and Cambrian rocks a large series was included under both designations, and a long dispute followed. Partly as a means of settling this dispute, but also on paleontologic grounds, the name Ordovician was proposed by Lapworth as the name of a period between the Silurian and Cambrian, and this proposition has received much favor; but the prevailing usage in Great Britain and North America refers the disputed series to the Silurian period, constituting it a minor division under the title Lower Silurian. The Silurian rocks of the U. S. are well developed in the basin of Lake Ontario and in the Champlain-Hudson valley, extending thence southwestward along the Appalachian chain through Pennsylvania, Maryland, Virginia, Tennessee, and Georgia into Alabama. In New England are several outlying areas, in which the rocks are metamorphic. In Ohio, Indiana, Kentucky, and Tennessee are broad areas laid bare by the erosion of the crest of the Cincinnati arch, and a still greater area follows the western coast of Lake Michigan and sets an arm up the Mississippi valley into Minnesota. Other areas are found in Missouri and Texas. The hydraulic cement and salt of New York and the fossil iron ores of the Appalachian chain from New York to Alabama, besides sandstones and limestones of architectural importance, are derived from formations of this period. See CAMBRIAN PERIOD AND GEOLOGY, and for the flora of this period see PLANTS, FOSSIL, and consult Murchison's *Siluria* (1834); Lapworth's *Tripartite Classification of the Lower Palaeozoic Rocks* (*Geol. Mag.*, vol. vi., 1879); Sedgwick's *Synopsis of the English Series of Stratified Rocks Inferior to the Old Red Sandstone* (*Proc. Geol. Soc.*, London, vol. ii., 1838).

G. K. GILBERT.

changed ores below, and are more easy to work. Such ores are known in Mexico as *colorados*, especially if red, and in Peru as *pacos*. The ores from a greater depth in the mine, which have not been acted upon by the air, are more compact, brilliant, and darker in color, and are called *negros*. The green bromide ores are known in Zacatecas, Mexico, as *plata verde*. Chloride of silver is common in the upper portions of rich silver-bearing veins, and usually forms thin dark-colored crusts or films upon the gangue. It is easily identified by its wax-like hardness, and by giving a globule of silver when fused in the flame of a candle.

A large class of the metallic minerals contain silver in varying proportions, especially galena and blende, which are rarely free from a portion of silver. The greater portion of the silver produced in Europe is extracted from argentiferous galena. The galenas of England and of the Hartz Mountains carry from '03 to '05 per cent., and those of Tuscany from '03 to '07 per cent. The galena ores of the U. S., with the exception of those of the Mississippi valley, nearly all contain silver in larger quantities, the percentage ranging from '10 to 1'85 and 3'0, but the quantity of these rich ores is seldom large in the Eastern States. Some of the Wood river and Kootenay lead ores carry 100 oz. to the ton, but 30 to 60 oz. to the ton of lead ore is a very fair yield. Formerly lead ores containing less than 10 oz. could not be profitably worked for silver, but since the discovery by Pattinson, of England, in 1829 of the process which bears his name, the cost of separating silver from lead has been greatly cheapened. Lead containing only 3 oz. of silver to the ton can now be worked with profit, and in smelting operations on a large scale where lead ores are used as a flux even a small amount of contained silver is incidentally important.

The antiquity of silver coinage is very great. The most ancient coins known were struck in silver by Phidon, King of Aegina, B. C. 869. After the conquest of Egypt by Cambyses, about 540 years before Christ, a great improvement appears to have been made in the purification of silver, for that which was produced under Aryandes was celebrated for its purity and fineness. The alloy in the Greek silver coinage generally appears to have been lead, which had not been removed for want of the requisite skill in refining. The Athenian currency was noted for its purity, and Xenophon mentions the profit with which it could be exported. Silver currency was adopted by the Roman republic about 269 B. C., and its standard was as high as the Greek, but it rapidly fell. Under Vespasian the alloy was one-eighth, under the Antonines one-fourth, under Severus about one-half, after which there does not appear to have been a fixed standard. (*King*.) After the loss of Spain, from which the chief supply of silver was drawn, the silver currency vanished, and was replaced by *billon* denarii, having only one-fourth part of silver. According to Pliny, Antony alloyed denarii with iron, apparently to harden the coin. The denarii of Justinian and the Italian Goths weigh about 15 grains troy, and are the reputed direct antecedents of the Anglo-Saxon silver penny.

Silver was largely used by the Romans for household plate and table decoration. It was elegantly chased and embossed in the *repoussé* style by Grecian artists. The wealthy Romans vied with each other in possessing the most massive dishes. Of such dishes, weighing 100 lb. or more, there were 150 in Rome before the first civil war. Pliny cites the existence of one dish weighing 500 lb., with eight plates to match, weighing together 250 lb. The old chased plate of the Grecian artists was valued as a curiosity in Pliny's time. The ornamentation of silver, known as niello-work, originated in Egypt, and was revived and carried to great perfection by the Florentine silversmiths. Cellini gives a recipe for the fusible argentiferous compound used to fill the engraved design. This art was applied to the decoration of armor as early as the days of Homer. Agamemnon's breastplate was thus inlaid. In mediæval times massive plate was in great favor, and the chief form of investment for the noble-born and wealthy. Its extensive use for ecclesiastical decoration is also to be noted. In 1891 over 4,000,000 oz. of silver were sent out from the mints of the U. S. in the form of bars for industrial uses. The total annual consumption of silver in the industrial arts approximates \$10,000,000 coining value, and is increasing.

In modern times solid silverware has been to a great extent replaced by nickelliferous alloys and britannia ware, covered with a layer of pure silver by the galvanoplastic method. Silver may, by this method, be deposited to any desired thickness, thus giving all the appearance of solid

silver, and its utility for most purposes. The annual consumption of the metal for this purpose alone is very large. Silver thus deposited is pure, but solid silverware and silver coin contain a portion of alloy, generally copper. In the U. S. and in France the standard fineness is one-tenth of alloy, or 900 parts of silver and 100 of copper, the mixture being denominated '900 fine. In Great Britain the standard is higher, being 925 of silver and 75 of copper, or '925 fine. This is the fineness of "sterling silverware."

The value of silver relatively to other objects obviously depends upon two chief conditions—the demand and the supply. The demand is seriously affected by legislation, as, for example, by the demonetization of silver. The variations in the demand are sufficiently indicated by the preceding references to its use in historic times. The supply is also variable, and at times excessive. The production of silver in the large way, owing to its mode of occurrence and mineralization, is more dependent upon the use of mechanical power (steam or water) than upon the labor of men, and generally it requires a heavy plant and large capital. There may therefore be a large production of silver in sparsely populated regions and within a short period of time. With gold, however, the bulk of the product is derived from placers. It is so much more generally distributed in the earth that an unlimited number of men may be engaged together in its production. No expensive preparations or chemical operations are required to obtain gold in a merchantable form.

The value of silver relatively to gold has greatly changed within historic times, and it has been different in various countries. Commerce has tended to equalize this difference. King justly observes that in the ancient world silver was to the same extent the peculiar production of Europe that gold was of Asia. It follows naturally that the estimation of silver relatively to gold was higher in Asia than in Europe—a condition prevailing until within a recent period. Sir Isaac Newton in 1717 showed that the ratio in weight of equal values of the two metals, silver and gold, in China and Japan was as 9:1, while it was as 15:1 in Europe. Perhaps the earliest recorded ratio is found inscribed at Karnak, the tribute-lists of Thutmosis (1600 B. C.) giving 13'33:1. The same ratio is shown by cuneiform inscriptions on plates found in the foundations of Khorsabad and on ancient Persian coins. It was reported by Xenophon (400 B. C.) as the ratio in Asia. Toward the Christian era gold fell in value relatively to silver. As early as about 189 B. C. the Romans coincided with the Greeks in estimating the value of gold compared with silver as 10:1. Upon Caesar's return to Rome gold became so abundant that the ratio for a time was as 7½:1. A century later the ratio was as 12½:1, where it remained for 150 years or more. When guineas were first coined in 1663 the value of fine gold compared with that of fine silver was rated in the English mint at about 14:1. In 1805 the ratio was nearly as 15:1, and in other countries gold was rated higher. In the Middle Ages the ratio varied from 9:1 to 12'8:1. At the date of the discovery of America the ratio was about 11'30:1, since which, up to the discovery of gold in California and Australia, it gradually rose to 15'83:1 in the year 1850. In 1870 and 1871 the average commercial ratio was 15'57:1, and in 1873 as 15'92:1, with a gradual increase to 26'49:1 in 1893, and 32'56:1 in 1894.

The annual production of gold and silver in the world, stated in kilogrammes, with the ratio of silver to gold by weight, is shown in the following table:

| YEARS.                  | ANNUAL PRODUCT, KILOG. |           | Ratio of silver to gold, by weight. |
|-------------------------|------------------------|-----------|-------------------------------------|
|                         | Gold.                  | Silver.   |                                     |
| 1871 to 1875, mean..... | 173,904                | 1,969,435 | 11'3                                |
| 1876.....               | 165,956                | 2,525,779 | 14'0                                |
| 1877.....               | 179,445                | 2,398,612 | 13'3                                |
| 1878.....               | 185,847                | 2,551,364 | 13'7                                |
| 1879.....               | 167,307                | 2,507,507 | 15'0                                |
| 1880.....               | 163,515                | 2,479,998 | 15'2                                |
| 1881.....               | 158,964                | 2,592,639 | 16'3                                |
| 1882.....               | 148,475                | 2,746,065 | 18'6                                |
| 1883.....               | 144,727                | 2,746,123 | 19'0                                |
| 1884.....               | 153,193                | 2,789,727 | 18'2                                |
| 1885.....               | 159,290                | 2,693,805 | 16'8                                |
| 1886.....               | 159,741                | 2,602,471 | 16'2                                |
| 1887.....               | 159,156                | 2,690,394 | 16'8                                |
| 1888.....               | 150,809                | 3,385,606 | 21'2                                |
| 1889.....               | 185,809                | 3,001,809 | 21'0                                |
| 1890.....               | 181,256                | 4,180,632 | 23'1                                |
| 1891.....               | 189,824                | 4,479,649 | 23'6                                |
| 1892.....               | 196,294                | 4,945,237 | 25'1                                |
| 1893.....               | 236,570                | 6,031,498 | 25'3                                |

From the tables submitted to the committee on coinage, weights, and measures, by the director of the mint in his hearings before that body on Jan. 27, 1892, it appears that at the ratio of 15½ to 1 there is about an equal amount of the two metals in circulation. The output of gold and silver from the mines since 1873 shows also about the same ratio in the respective weights of the metals produced. Nor does the fact that in the latter part of this period the ratio has exceeded this in favor of silver invalidate the argument, for the per cent. of increase when compared to the whole stock of gold and silver is too small to be taken into account, and, moreover, is probably but temporary. Since the ratio of the world from 1803 to the demonetization of silver in 1873 was 15½ to 1, and even since the latter date has been about the same, and since the debts of the world, both public and private, have been contracted at this ratio, it is a gross injustice to the producing classes, which at last liquidate these debts, to readjust the ratio so as to conform to the demonetized price of silver as compared with gold. Measured by commodities, gold has risen 50 per cent. since the demonetization of silver in the U. S. in 1873. Silver, as compared with gold, has not fallen more than 30 per cent. Silver, therefore, as measured by commodities, has not fallen, but, on the contrary, the weight of testimony shows that there has been a slight appreciation of silver in spite of its demonetization.

The Secretary of the Treasury, Mr. Windom, in his annual report for 1889, page 73, arguing against the proposition to put more silver in the dollar, says: "The paramount objection to this plan, however, is that it would have a decided tendency to prevent any rise in the value of silver. Seizing it at its present low price, the law would in effect declare that it must remain there forever, so far as its uses for coinage are concerned." In all the centuries of the past no difficulty has been encountered in the question of using both gold and silver as money. For nearly a hundred years the two metals were at par at the French ratio of 15½ to 1. This condition remained till the U. S. and Germany demonetized silver, or, more correctly speaking, the par remained, notwithstanding the demonetization by the U. S. and Germany, till France suspended the coinage of silver. Had France continued the coinage, the par no doubt would still exist. To demonetize silver and thus cause a greater demand for gold, to compel gold to rise 50 per cent. and then insist that silver shall be coined at a ratio to meet the rise in gold, is a legislative confiscation of the rights of debtors. If this policy were generally adopted it would in effect demonetize at least 30 per cent. of the silver stocks of the world; in other words, it would eliminate about one billion two hundred million in value of silver now in circulation. It would also demonetize 30 per cent. of all the future productions of this metal. A restoration of silver by its enlarged demand and consequent enlarged value is demanded. The free use of silver will lessen the demand for gold and increase the demand for silver, thus causing gold to fall and silver to rise, and in this way the par of the two metals can be brought about without injustice to creditors or debtors.

R. P. BLAND.

*Objections to the Free Coinage of Silver.*—Some of the principal objections to the free coinage of silver will appear from the following paragraphs: By the Coinage Act of 1873 the standard silver dollar of 412½ grains was dropped out of the monetary system of the U. S. The act was not passed surreptitiously, as has sometimes been asserted by the silver-money men. It was recommended by the Secretary of the Treasury in three successive messages, the bill was printed thirteen times, considered through five sessions of Congress, and the debates concerning it occupy 140 pages of the *Congressional Record*. Nor did it drive silver out of circulation, because there were no silver dollars in circulation, very few having been coined since 1834 owing to the fact that it had been cheaper to coin gold than silver. Nor was it an attempt to injure the debtor class for the benefit of the creditor class, because at the time the silver dollar was worth 102 cents in gold and no debtor would choose to pay in silver. It is necessary to state these facts in order to show that free coinage of silver can not be demanded on the ground of an original injustice committed in 1873.

From 1873 to 1878 no silver dollars existed in the financial system of the U. S. In 1878 the silver-money men succeeded in passing the Bland-Allison bill restoring the silver dollar as legal tender, but providing for only a limited coinage, so that gold still remained the standard. In 1890 the Sherman act provided for the purchase of a larger amount of silver,

4,500,000 oz. per month, but at the same time declaring it to be the policy of the U. S. Government to maintain all dollars at a parity. Here also there was no adoption of free coinage. In 1893 the Sherman act was repealed so far as the purchasing clause was concerned, and in 1894, the President vetoed the bill for the coinage of the seigniorage. The U. S. since 1873 has therefore rested officially on the gold basis, and for the purpose of maintaining this basis it sold \$162,500,000 worth of bonds during 1894 and 1895. On this statement of facts we have the following conclusions:

(1) Free coinage of silver can not be demanded as a matter of justice. Since 1873 all contracts have been entered into on the gold basis, and no injustice has been committed by the Government toward the debtor class.

(2) It is impossible for the Government to maintain the price of silver. Notwithstanding the coinage of \$400,000,000 under the Bland act, and the purchase of \$152,000,000 under the Sherman act, the price has fallen from \$1.29 per ounce to 65 cents per ounce (1895). The fall in the price of silver is due, therefore, to the increased production of silver, not to its demonetization.

(3) Free coinage of silver would not restore its value. Even if it drove all the gold out of circulation the demand for silver as a circulating medium would be limited. If the value of silver went up temporarily an enormous stimulus would be given production, so that the supply would increase and the price would come down. The U. S. would also get silver from other nations who would be glad to unload on it.

(4) Free coinage of silver would therefore not establish bimetallicism, but would drive gold out, bring the U. S. to the silver basis and result in inflation of prices. It is said that this inflation would benefit the debtor class who have suffered so grievously during the last twenty years by the fall of prices. It is not probable that such relief would be attained. The first result of free coinage would probably be contraction of the currency by the loss of gold and sinking of values due to panic. All mortgages due would be foreclosed and the land thrown on the market, or the mortgages renewed only on a gold basis. On the other hand, the creditor class would be injured, and in that class are included all depositors in savings-banks, all beneficiaries of trust funds, and all small investors. All men living on fixed salaries would be injured, because the cost of living would go up. Finally, the laboring class would suffer from increased cost of living and because during inflation wages rise more slowly than prices.

Free coinage of silver would seem to be a very hazardous experiment, bringing more hardship and injustice than it remedies. It would remove the U. S. from the ranks of the great commercial nations with the gold standard. It would destroy public credit and lead to partial repudiation of debt. It would drive away the foreign investor of capital and retard the national development. Owing to the apparently unlimited supply of silver it would make the standard of value very uncertain, thus embarrassing all commercial dealings.

R. MAYO-SMITH.

**Silver Creek**: village; Chautauque co., N. Y.; on Lake Erie, at the mouth of Silver creek, and on the Lake Shore and Mich. S., the N. Y., Chi. and St. L., and the W. N. Y. and Penn. railways; 9 miles E. N. E. of Dunkirk, 31 miles S. S. W. of Buffalo (for location, see map of New York, ref. 6-B). It is in an agricultural and grape-growing region, and contains manufactories of milling machinery and a weekly newspaper. Pop. (1880) 1,036; (1890) 1,678.

**Silvering**: See MIRRORS.

**Silver-plating**: See ELECTRO-PLATING.

**Silverside, or Silver Fish**: See ATHERINA.

**Silver Stick**: in the British court, a title borne by the lieutenant and the standard-bearer of the corps of gentlemen-at-arms; also by the field officer commanding any of the guard regiments. See GOLD STRICK.

**Silverton**: town; capital of San Juan co., Col.; on the Animas river, and the Denver and Rio Grande and the Silverton railways; 285 miles W. S. W. of Pueblo, 494 miles S. W. of Denver (for location, see map of Colorado, ref. 5-B). It has an elevation of 9,400 feet above sea-level; is surrounded by high mountains, including the noted Sulfur Mountain about 2 miles distant; and contains gold and silver mines, smelting-works, a national bank with capital of \$50,000, a State bank, and two weekly newspapers. Pop. (1880) 264; (1894) estimated, 1,100.

**Silvestre**, scil'vest'r', THEOPHILE LOUIS: writer on art; b. at Fossat, in the department of Ariège, France, Oct. 12.

tutions which are in a flourishing condition. Splendid entertainments and balls are given by the viceroy and high functionaries who pass the summer here. Simla has a theater, a concert-room, Episcopal churches, and one Roman Catholic church. Pop. 13,000. See *Gazetteer of the Simla District* (1888-89). Revised by M. W. HARRINGTON.

**Simmons, EDWARD EMERSON:** genre and portrait painter; b. at Concord, Mass., Oct. 27, 1852; pupil of Boulanger and Lefebvre, Paris; member of the Society of American Artists (1888); honorable mention, Paris Salon, 1882; third-class medal, Paris Exposition, 1889; Temple silver medal, Pennsylvania Academy, Philadelphia, 1889. One of his best works is *The Carpenter's Son* (1890). He lived for several years at St. Ives, Cornwall, England, and painted there, exhibiting at the Royal Academy, London, and in Paris and New York. He visited the U. S. and painted portraits in New York and Boston in 1891 and 1892. Studio in New York. WILLIAM A. COFFIN.

**Simms, WILLIAM GILMORE:** novelist; b. at Charleston, S. C., Apr. 17, 1806; studied law, and was admitted to the bar 1827, but abandoned that profession for literature and journalism, publishing in the same year two volumes of *Poems*; became in 1828 editor of the *Charleston City Gazette*, a political journal of Union proclivities, which was discontinued during the nullification excitement of 1832, leaving him in poverty; resided at Hingham, Mass., 1832-33; wrote there his longest and best poem, *Atalantis, a Story of the Sea* (New York, 1833), and his earliest novel, *Martin Faber, the Story of a Criminal* (New York, 1833); returned soon afterward to South Carolina and settled at Woodlands, near Medway; wrote a series of romances founded on Revolutionary incidents in South Carolina, including the *Partisan* (1835); romances of colonial life, of which *The Yemassee* (1835) is considered the best; published 11 volumes of novelettes, collected tales, and essays; 2 volumes of *Views and Reviews in American History, Literature, and Fiction* (1845-46), collected from a large number contributed to the leading magazines and periodicals; a *History of South Carolina* (1840), a *Geography of South Carolina* (1843), and *South Carolina in the Revolution* (1854). He was several years a member of the South Carolina Legislature, and filled other political offices. D. at Charleston, S. C., June 11, 1870. His best works of fiction were republished in 19 vols. (London, 1853-59; new ed. 17 vols., 1865), under the title *Revolutionary and Border Romances of the South*, with illustrations by Darley. A copious selection of his *Poems* appeared in 1864. See the *Life* by George W. Cable in *American Men of Letters Series* (Boston, 1888).

**Simon, Sir JOHN:** surgeon and sanitarian; b. in England in 1816; was made professor in King's College, London; surgeon to King's College Hospital and to St. Thomas's Hospital; was the first medical officer appointed to the general board of health of the privy council, in which capacities his annual reports on sanitary science, dealing with important questions of the day in medicine, have been of great value. His *Physiological Essay on the Thymus Gland* (1845) gained the Astley Cooper prize of £300. He has received honorary degrees from the Universities of Munich, Dublin, Oxford, and Cambridge. Among his works are *Aims and Philosophic Method of Pathological Research* (1848) and *Lectures on General Pathology* (1850). He has contributed largely to the *Cyclopædia of Anatomy and Physiology* and to scientific and medical periodicals, and edited (with a prefatory memoir) Dr. J. H. Green's *Spiritual Philosophy, founded on the Teachings of the late Samuel Taylor Coleridge* (2 vols., 1865). Revised by S. T. ARMSTRONG.

**Simon, scé'môn', JULES FRANÇOIS SUISSE:** statesman and political writer; b. at Lorient, department of Morbihan, France, Dec. 31, 1814; succeeded Cousin as Professor of Philosophy at the Sorbonne in 1839, but was dismissed in 1851 on account of his opposition to the *coup d'état*; lectured in 1855 and subsequently on philosophy in various cities in Belgium; was elected a member of the Legislative Assembly for the department of Loire in 1863; offered a strong opposition to the policy of Napoleon III., the plebiscite of 1870, the declaration of war against Prussia, etc., and was a member of the Government for the national defense established on Sept. 4, 1870, and of the Government of Thiers, Feb. 19, 1871-May 24, 1873, as Minister of Public Education. During his term of office he carried through important reforms, but provoked the hostility of the clericals by his efforts to establish compulsory education. On Dec. 13, 1876, he became premier, but difficulties with the

president caused his resignation in May, 1877. Chosen senator for life in Dec., 1875, he has been one of the principal representatives of the conservative republican party. His writings are distinguished by clearness and precision, both of style and ideas, and some are the result of very comprehensive studies. Among them are *Histoire de l'École d'Alexandrie* (2 vols., 1844); *Le Devoir* (1854); *La Religion naturelle* (1856; translated into English by I. W. Cole, London, 1857); *La Liberté* (2 vols., 1859); *L'Ouvrière* (1863); *Le Travail* (1866); *La Politique radicale* (1868); *Le Livre échange* (1870); *Souvenirs du 4 Septembre* (1874); *Dieu, Patrie, Liberté* (1883); *Thiers, Guizot, Rémusat* (1885); and *La Femme du XX<sup>e</sup> siècle* (1891). F. M. COLBY.

**Simon, RICHARD:** biblical critic; b. at Dieppe, France, May 13, 1638; entered the Congregation of the Oratory in 1659, but left it again in 1678; was for a short time priest at Belleville, but retired in 1682 to his native city; devoted himself exclusively to literary pursuits. D. at Dieppe, Apr. 11, 1712. His writings—*Fides Ecclesiæ Orientalis* (1671); *Histoire critique du Vieux Testament* (1678; Eng. trans., *A Critical History of the Old Testament*, London, 1682); *Histoire critique de la Créance et des Coutumes des Nations du Levant* (1684); *Histoire critique du Texte du Nouveau Testament* (1689; Eng. trans., *A Critical History of the Text of the New Testament*, 1689); *Histoire critique des Principaux Commentateurs du Nouveau Testament* (1692); *Nouvelles Observations sur le Texte et les Versions du Nouveau Testament* (1695)—form the first and, both on account of the consistency of the ideas and on account of the learning of his arguments, one of the most powerful manifestations of that theological standpoint afterward known as rationalism. They were violently attacked by the Port-Royalists, Bossuet, and other theologians. See his *Life*, by A. Bernus (Lausanne, 1869). Revised by S. M. JACKSON.

**Simone da Pesaro:** See CANTAVIUS, SIMONE.

**Simonians:** See SIMON MAGUS.

**Simonides, si-mon'i-dées (Σιμωνίδης), or Semonides (Σεμωνίδης),** commonly called of *Amorgos*, though b. at Samos; Greek iambic poet who flourished about 625 B. C. He is known chiefly by a satirical poem—a manner of "Mirror of Women"—in which various types of women are represented as descended from various animals and from earth and sea. Only one type of the sex receives his commendation, the "bee-woman"; the rest are handled without mercy and with a kind of personal spite. The remains of Simonides were edited by Welcker (1835), and by Bergk in his *Poetae Lyrici Græci*, vol. ii., p. 441 fol. (4th ed.). B. L. GILDERSLEEVE.

**Simonides (Gr. Σιμωνίδης):** one of the greatest lyric poets of Greece; b. at Iulis, in the island of Ceos, about 536 B. C.; d. about 468 B. C. His sunny temper and his easy philosophy of life made him welcome wherever his vocation took him, whether he sojourned with the Pisistratids at Athens or among the Scopadæ and Aleuadæ of Thessaly. After Marathon, this encomiast of tyrants and oligarchs won the prize over Æschylus for his elegy on those who had fallen in the great battle, and his distich on the dead of Thermopylae is the most famous in the range of literature. In Sicily he served as mediator between Thero and Hiero (476), and was a special favorite at the brilliant courts of Syracuse and Agriguntum. It was at the court of Hiero that he came into collision with his great rival, Pindar, who claimed for himself a loftier spirit and a truer inspiration; and the very wit and grace of Simonides, his ready sympathy with the spirit of the age, the mundane tone of his poetry, his almost sophisticated dexterity have justified the claims of Pindar in the eyes of modern critics. Of his many lyrical poems a fragment remains to warrant what the ancients say of the perfection of his style in everything that he touched, of the exquisite tenderness of his dirges, in which he surpassed all rivals, and of his unequalled command over the resources of the epigram. His fragments were edited by Schneidewin (Brunswick, 1835), and by Bergk in his *Poetae Lyrici Græci*, vol. iii., pp. 384-535 (4th ed.). B. L. GILDERSLEEVE.

**Simon Magus:** a Samaritan of the apostolic age; b. Justin Martyr says (*Apol.*, i., 26), at Gitton, which has been identified with *Kuryet Jit*, a village near Nablus. He is described in Acts viii. 9-24 as a sorcerer, called by the people "that power of God which is called great," who was apparently converted by the preaching of Philip, and sought to purchase with money the power of imparting the Holy Ghost; whence the expression *simony*. Of his subsequent

Church; became vice-president and Professor of Natural Science at Allegheny College 1837; president of Indiana Asbury University at Greencastle, Ind., 1839; editor of *The Western Christian Advocate* 1848, and was elected bishop 1852. He was an intimate friend of President Lincoln, at whose request he devoted much of his time during the civil war to the maintenance of public sentiment in behalf of the Union by addresses in many Northern cities, being also employed by the Government in several important confidential commissions. In 1863-64 he made an extended tour of inspection of the missions of his Church in Syria and the East generally, and traveled through several countries of Europe upon a similar errand. He visited the Mexican missions 1874, and the European mission conferences 1875, and on his return became a resident of Philadelphia. Author of *A Hundred Years of Methodism* (1876); *Cyclopædia of Methodism* (1879); *Yule Lectures on Preaching* (1879); and *Sermons* (1885). D. in Philadelphia, June 18, 1884. See his *Biography*, by G. R. Crooks (New York, 1890).

**Simpson, THOMAS**: mathematician; b. at Market-Bosworth, Leicestershire, England, Aug. 20, 1710; was in early life a weaver, but became an accomplished mathematician by private study; was for some years a teacher in Derby and in London; became Professor of Mathematics in the Royal Military Academy at Woolwich 1743, and a fellow of the Royal Society 1745; and published many ingenious papers on pure mathematics and physical astronomy. He published works on fluxions, the laws of chance, doctrine of annuities, algebra, geometry, and trigonometry. D. at Market-Bosworth, May 14, 1761.

**Simrock, KARL**: poet and author; b. at Bonn, Germany, Aug. 28, 1802; studied jurisprudence in his native city and in Berlin; entered the Prussian civil service, but was dismissed in 1830 on account of a song he wrote on the revolution of July in Paris; devoted himself to literature, and studied especially the old German language and literature, of which he was appointed professor at Bonn in 1850. His chief poetic work is *Wieland der Schmied* (1835), one of the best epic poems of modern German literature, in which the old hero-legend is successfully revived. He translated with excellent taste and remarkable skill the *Nibelungenlied* into modern German (1827); several works of the minnesingers; the *Edda* (1851); *Beowulf* (1859) and *Heliand* (1856); Shakespeare's *Sonnets* (1867); Tegnér's *Frithiof's Saga* (1863); and many other medieval works of poetry. He also published a *Handbuch der deutschen Mythologie* (1864); *Die Rheinsagen* (1836); *Deutsche Volksbücher* (1839-67); *Quellen des Shakespeare* (1831), and other works. D. at Bonn, July 18, 1876.

Revised by JULIUS GOEBEL.

**Sims, GEORGE ROBERT**: journalist and dramatist; b. in London, Sept. 2, 1847; was educated at Bonn; entered journalism, and contributed to the press the *Dagonet Ballads* (1879); *Three Brass Balls* (1880); *The Social Kaleidoscope* (1880); *Ballads of Babylon* (1880); *The Theatre of Life* (1881); *How the Poor Live* (1883); *Stories in Black and White* (1885); *Mary Jane's Memoir* (1887), etc. His letters to the London *Daily News* on the condition of the poor attracted much attention, and led, in part, to the appointment of a royal commission. Has written with success for the stage—*The Lights of London* (1882); *The Romany Rye* (1883), etc.

H. A. BEERS.

**Sims, JAMES MARION, M. D., LL. D.**: surgeon; b. in Lancaster co., S. C., Jan. 25, 1813; graduated at South Carolina College, Columbia, 1832; studied medicine at Charleston and Philadelphia, graduating M. D. at Jefferson Medical College 1835; in 1836 entered upon the practice of his profession at Montgomery, Ala.; in 1845 called attention to his new theory of the nature and origin of trismus nascentium, and also to the subject of vesico-vaginal fistula, inventing instruments and an operation for the cure of that lesion. He urged the use of metallic sutures in every department of general surgery. In 1852 he published a full account of his discovery in *The American Journal of Medical Sciences*. In 1853 he settled permanently in New York. His investigations of the diseases peculiar to women early led him to perceive the importance and necessity of establishing a great permanent woman's hospital in New York, and a temporary hospital was opened in May, 1855. Dr. Sims was elected attending surgeon, with Drs. Mott, Francis, Stevens, Green, and Delafield as a consulting board. In 1857-58 he obtained from the Legislature a charter for the Woman's Hospital of the State of New York, and the city of New York

granted a site on which a hospital was built. In 1861 Dr. Sims went to Europe, and he operated in Dublin, in London, in Paris, and in Brussels. He received decorations from the French, Italian, Spanish, Portuguese, and Belgian Governments as a public benefactor. In 1868 he returned to New York. In 1870, on the breaking out of the Franco-German war, he organized in Paris the Anglo-American Ambulance Corps, took charge of it as surgeon-in-chief, and went with it to Sedan. Soon after this Dr. Sims returned to New York. To his labors and discoveries are mainly due the establishment of the science of gynecology as a new department in medicine, recognized by a special professorship in all well-organized medical colleges. Dr. Sims was a corresponding member of many learned societies in the U. S. and Europe, notably of London, Edinburgh, Berlin, Christiania, etc., and of the Royal Academy of Medicine of Brussels. He was elected president of the American Medical Association at its meeting at Louisville, Ky. D. in New York, Nov. 13, 1883. There is a monument of him in Bryant Park, New York. See his autobiography, *The Story of my Life*, edited by his son, H. Marion Sims, M. D. (1884).

**Simulation**: See FEIGNED DISEASES.

**Sinai**, sī'nā, or sī'nī [from Heb. *Sinay*; cf. *Sin*, the wilderness of Sin, liter., clay]: (1) a triangular peninsula of Arabia Petraea, between the Gulfs of Suez and Akabah. Its apex points S.; its base is 150 miles across from gulf to gulf; its western side 186 miles long, its eastern side 133, and its area about 11,500 sq. miles. First comes the wedge-like protrusion of the limestone plateau known as the Desert of the Wandering, then a sandstone belt, and finally the mountain-masses of granite and porphyry, flanked right and left by narrow strips of lowland bordering the gulfs. These mountains may be divided into three groups, the highest peaks of which, respectively, are Serbal (6,734), Catharine (8,526), and Shomer (8,449). The ancient Egyptians called this peninsula "the land of the gods." Its solitary grandeur impresses all travelers alike. Mines of iron, copper, and turquoise were once worked here. It is still the home of about 5,000 Bedouin. The curious inscriptions, found mostly on the western side of the peninsula, are generally in the Nabataean character, and the Nabataeans were, about the beginning of the Christian era, the chief traders between Egypt and Assyria. They were an Arab people living on the east and southeast of the Holy Land. Some of the inscriptions are Greek and a few Coptic. With them are rude drawings. The whole was probably the work of caravans between 200 B. C. and 400 A. D., and of no more importance than such scratchings usually are.—(2) Used in the Old Testament interchangeably with Horeb to designate the Mountain of the Law. Lepsius and others have tried to identify it with five-peaked Serbal, the most picturesque of all the mountains of the peninsula; but the true Sinai is a gigantic mass, about 2 miles long from N. to S., and about half a mile wide from E. to W. Its southeastern peak, called Jebel Musa, is the traditional scene of the giving of the Law; but there was not open space enough on the south side of the mountain to accommodate the Hebrew host. Its northwestern peak, called Sufsafah, overlooks three wadies (Rahah, Deir, and Leja), which might easily have held 3,000,000 or 4,000,000 people; and there is no other such spot anywhere in the whole peninsula. Here the Israelites encamped for a year, and here the Law was given. The watershed at the foot of Sinai is 5,140 feet above the sea, Jebel Musa 7,359, Sufsafah a little lower. The famous convent of St. Catharine, in whose library Tischendorf discovered the Sinaitic Codex of the Scriptures (in 1844), and Mrs. Agnes Smith Lewis the oldest text of the Syriac Gospels (in 1893), is on the east side of the mountain.

**Sinaitic Inscriptions**: See CODEX SINAITICUS.

**Sinaloa**, scē-nāā-lō'āā (sometimes written CINALOA): a northwestern maritime state of Mexico, bounded by Sonora on the N. W., Chihuahua and Durango on the N. E., Tepic on the S. E., and the Pacific and the Gulf of California on the S. W. (see map of Mexico, ref. 4-D). Area, 36,184 sq. miles. The eastern and northeastern parts are covered with spurs and terraces of the Sierra Madre, which have a true mountainous character, and sometimes attain 6,000 feet in altitude; on their slopes are extensive oak forests, and the valleys are very fertile. The coast belt is low, and in parts unhealthy; there are many lagoons near the gulf. Several rivers cross the state, flowing down from the Sierra

**Single Tax:** a term which has come into use since 1887 to denote the proposal, theory, or movement which aims at the collection of all public revenues from one single source, what in political economy is termed "rent," the value of land itself, irrespective of the value of any improvement in or on it; or, to adopt another form of statement, a proposal or movement which aims at the appropriation of economic rent, the "unearned increment of land values" to public uses, by means of taxation.

These two forms of statement, though often indiscriminately used, since the practical method of reaching the single tax from existing conditions is "to abolish all taxation save that on land values," are suggestive of two different points of view—the fiscal and the moral—that of governmental expediency and that of social justice. Although social justice must really include governmental expediency, the argument for the single tax may perhaps be most concisely put by presenting it first from the narrower and then from the wider of these standpoints.

*From the fiscal side,* the single tax offers the cheapest and in all respects the best mode of raising public revenues. Every owner of a valuable estate has the power of raising revenue from those who use it. He may, as was largely the custom of feudal landlords, require from his tenants a multiplicity of payments, conditioned on what they may do or have—as on the building or repairing of houses, the growing of crops, the engaging in certain occupations, the possession of certain amounts or forms of wealth, the bringing in or taking out of goods; or even on such occurrences as births, deaths, or marriages. But reason and experience both show that the largest revenue can be raised with the least trouble and expense by substituting for such small exactions one single charge or rent, and this has become the custom of enlightened landlords. Now the taxing power of the state is simply that of the superior landowner or "over-lord" of a certain area. It exists only within that area, and, as in the case of the individual landlord, is limited by what people are willing to pay for the privilege of living in it. For though the state still retains the power of seizure and punishment, which once belonged to the larger landlords (the "right of pit and gallows"—i. e. of life and death—having in Scotland been taken from them only in comparatively recent times), this avails nothing in the raising of permanent revenues. If taxes be imposed beyond a certain point in any given area, men will refrain from coming into it, those already there will leave if they can, and those who can not leave will become impoverished and finally starve and die. There are many instances of populous cities reduced to ruins and fertile districts to deserts by ill-laid and excessive taxation.

Thus the same principles that enable the individual landlord to raise the largest revenue with the least waste, cost, and trouble, by a single rent-charge, apply in the case of public revenues; and the common-sense way for the state or any of its subdivisions to obtain revenues is by a single tax on the value of land. The attempts of governments to raise revenues by other taxes are really as stupid and barbarous as would be the resort of an individual landlord to petty feudal exactions. Such taxes invite evasion, fraud, and perjury; they require an expensive array of tax-gatherers, and even then can not be fairly assessed or fully collected. They check production, lessen accumulation, and take from the people much more than the state receives. The waste involved in the more important of them is not merely in the expenses of trying to collect them and of trying to evade them. Taxes on imports, taxes on internal production or exchange, taxes on capital in any of its forms, nearly all license taxes, and all that part of real-estate taxes that rests on buildings and improvements do not really fall on those who pay them to the state, but with added interest and profits finally fall upon the ultimate user or consumer. These taxes are really of the nature of that most destructive of fiscal devices, the farming of revenue.

Since a tax on the value of land is not a tax on land, but on an advantage accruing on specially desirable land, which can in no case go to the land-user as user, it can not check production, or lessen the return from use or improvement, or be shifted from shoulder to shoulder, increasing in weight as it goes. Avoiding all the waste, loss, and fraud of indirect taxes, it also avoids the evasions and injustice that attend attempts to tax incomes of all kinds, and is of all possible taxes that which may be most cheaply, certainly, and equitably obtained. It can not be evaded. It must fall on the owner, wherever he may be, taking from him, not in

proportion to anything his labor or capital may have contributed to the general wealth, but only in proportion to the unearned income which the adjustments of the state give him the special privilege of receiving. Land can not be concealed or removed, and its value can be ascertained with greater ease and certainty than any other value. A small sign on each separate piece of land, giving boundaries, area, and valuation, would bring public knowledge and opinion to the aid and correction of the assessment, while under a proper system the collection would involve little more than the clerical labor of receiving. In the U. S., as taxes are levied on land-values for state and local purposes in the tax on real estate, and as the percentage needed for national purposes could be collected by the same system, the substitution of this one method of raising public revenues for the complicated system in use would involve no new machinery, but only the abolition of many offices and the great lessening of corruptive and demoralizing agencies.

*From the Moral Side.*—The perfection of the single tax as a fiscal measure does not, however, account for the rapid spread of the idea and the ardor it excites. These come from its moral side, in which it is apprehended as the easy, yet, under the conditions of the times, the only possible way of relieving undeserved poverty, establishing social justice, and avoiding that monstrous inequality in the distribution of wealth that is so rapidly developing destructive tendencies in modern civilization. The argument from this side may thus be briefly stated:

The equal right to land flows from the right to life, and is the corollary of the right of property, or exclusive right of the producer to the product. In the rude stage of social life, where a simple industry seeks to satisfy primary need from the spontaneous offerings of nature, the equal right to the use of land and the exclusive right to the products of labor are secured when all have free access to the land ranged over by the tribe, and each may dispose of what his efforts obtain. But as society begins to take settled form, the division of labor begins to separate occupations, and a higher use of land calls for the use of capital, social order, industrial necessities, and the recognition of the right of property, all require such exclusive possession of land as shall assure to him who plants that he may reap, and to him who builds that he may enter in. This need becomes wider as civilization advances and improvements become more costly and industry more complex.

But no matter how far civilization advances, the exclusive right of property need never interfere with the equal right to the use of land. For these rights are correlative, the one involving the other, and the denial of one being really a denial of the other. Thus to deny to a man his equal right to the use of land is to deny him the benefits of his own labor, and to compel him to yield that labor or its products without due return. So far from the right of property making it necessary to attach to land that right of ownership which by natural law attaches to things temporarily drawn from land by labor, such treatment of land is as truly a denial of the right of property as making property of men. Between chattel slavery, the rude method of appropriating labor, and industrial slavery, the more civilized method, the difference is only of form. In the one, the man himself is treated as the property of another; in the other, the land on which the man must live is treated as the property of another. The result in either case is robbery, and robbery that may go to the same pitch. To the chattel slave must be left enough of his earnings to support life. Are there not to-day in so-called free countries great bodies of men who think themselves fortunate to get this?

In the relations of individuals with each other we find no difficulty whatever in combining exclusive possession with equal rights to use. A man may leave a horse, a ship, a building, or anything else incapable of division, to his children or to others equally; or such equal rights may be acquired in daily transactions without difficulty being encountered. Where a right to use can not be divided, its value may. So the exclusive possession of land called for by social advance need involve no denial of the equal right to use. That equality may be secured in a way permitting the best use of land by requiring from him who is accorded exclusive possession of any piece of land a contribution to common uses equivalent to any advantage it gives over that obtainable from the best land that others are free to use. There is nothing new in this. The principle lay at the base of feudal tenures, and is applied partially in Chicago, where the equal right of the whole community to the use of a cer-

and types of land now covered with very valuable buildings, the property of individuals, is recognized by the appropriation of the ground rent to municipal purposes; and there are similar examples in many other cities. The special advantages attaching to the possession of any piece of land is almost entirely measured by ground-rent, since it is what this value is based upon. By taxing that, and that alone, no harm is done to the right to land and the exercise of it; of property may be secured in any stage of civilization, business advancement, and the quality placed on the only productive basis, that of land, between man and man.

These considerations and moral considerations both point to a corresponding relation between the need for public revenues and the value of land. If we consider the appearance, growth, and direct cause of the two phenomena, the connection becomes inevitable, and the main recognition of which we see that the work secured in the mother's house is intended for the sustenance of the babe stands in a harmonious relation to the provision for public revenues.

In the primitive social condition in which land may be said to have existed, the state exists only in the rudimentary form of order and authority, an occasional council, and there is no need for regular public revenues. The division of labor, which is the mark and measure of civilization, does not introduce that some men shall devote themselves to public service; there are no courts or schools to maintain; no roads to make, no public buildings to erect; no streets to pave and clean and water, none of the public needs of civilization to provide for. In this social condition land has no value whatever for land has no original value, and no increase from the first things produced by labor. But the same advance in civilization that brings the need for public revenue attaches value to land; and while, by lessening the cost of production, it tends steadily to lessen the value of products of labor, it also steadily tends to increase production. When a few self-contained families possessed some land, and there was no need for public revenues, and no value to land. In New York to-day immense public buildings are needed to meet legitimate public wants, and land has an enormous value that the most costly and expensive buildings are not so valuable as the bare land they cover.

This is why, in whatever civilization centers. The same social advance which by increasing public needs calls for more public revenues, correspondingly, and even more than correspondingly, increases the value of land. The reason is that the integration of individuals, in which civilization consists, besides increasing the power of individual exertion, creates a desire, develops in the soul itself an additional power of satisfaction which tends to localization, not merely bringing out important differences in the original qualities that adapt land to the production of human desires, but, in some cases, changes center, attaching enormous value to some standing alone. It is notably that all public improvement, material, political and even moral increase this "unearned increment": it also grows by private improvement, by the creation of a beautiful dwelling, the opening of a good hotel, or well-appointed store, or of a factory or factory, or even improvement in the personal qualities or conditions which make people more desirable neighbors, realize an advantage that becomes tangible in land-values. The adoption of the single tax itself, while it would destroy speculative gain, would by promoting general prosperity tend to easily increase the aggregate of economic rent, the value attaching to land itself.

Man is not produced by land, which is but the passive factor in production; nor yet is it produced by the land alone, nor is land itself a contribution no more to production than could a diamond or a diamond. The active factor in all production is human exertion or labor, of which capital is merely a further production is a substitution. In the most common form of industry the whole product goes to the worker as wages. In the most higher form it is distributed between the worker, the land, and capital, in wages and interest, but in that still higher form of industry which we call the public in social development when a value is added to land, the distribution of the product is in wages, interest, and rent. This distribution is a matter of social law, and there is no possible division of human labor or of individual property by which rent can be made to increase wages or interest. If it be turned over to a common or a capitalist, he becomes in receiving it a landlord, a tax collector, and one at one time separates what he receives from what he receives as a landlord or as a capitalist.

for there is no rent until, and so long as, some one stands willing to pay for the privilege of using land.

Thus, therefore, the "unearned increment" is a natural growth, born of civilization and increasing with its advance, belonging to the society itself as distinguished from the individual members, by the same right of property which gives to the individual the ownership of his product. It is the natural provision for the natural need of public revenues, a fund created by the social organism to meet the same exigencies to those of the physical body for sustenance, which come with its definite appetites and grow with its growth.

For this is not all more. For that which it develops a fund belonging to the social and not to the individual, shows that the order and direct cooperation of man with his fellow, to which all increase in his knowledge and power is due, should bring a greater and greater equality of condition, and thus that our highest moral harmonies are not needed by, but correspond to the design of that originating intelligence manifest in the phenomenon of nature. Now good and evil lie not in things but in their uses, whatever is potent for good being correspondingly potent for evil. Thus the means or perversion of the natural provision by which the advanced civilization tends to bring about a higher and higher equality in human conditions must turn that advance toward a more and more monstrous inequality.

In the perversion of the great law of rent lies the explanation of those threatening evils which threaten modern civilization to-day. Regarding what rightfully belongs to it, the state is driven by its need for public revenues to ignore the moral right of property and to take what rightfully belongs to individuals, by taxes that increasingly fall most heavily on those best able to bear them, that check production, render distribution inequitable, foster monopolies, create artificial crimes, put a premium on fraud and perjury, corrupt government, and debauch morals. But worse than this: what the state refuses to take must go to mere land-owners, thus not only creating a class of idle rich, who become demoralized and demoralizing social factors, but by attaching a premium to the forestalling of land and developing speculative rent turn the very forces of invention and improvement which directly increase the productive power of labor into agencies which degrade and impoverish the laboring masses by creating an artificial scarcity in the indispensable natural element of all production and all life.

This is why those who apprehended the single tax from the moral side see in it the only yet only possible way of saving our civilization from otherwise certain destruction, and turning its advance to nobler heights than have yet been more than dreamed of. To them the single tax means the abolition of all real taxes: the taking for society of the provision made in the natural order for its needs; the conforming of the most fundamental of all social adjustments to the moral laws of the Creator.

HENRY GEORGE.

**Sing Sing:** village, Westchester co., N. Y.; on the Hudson river, and the N. Y. Cent. and Hud. River Railroad, 31 miles N. of New York (for location, see map of the State of New York, ref. 9 J). Its structural features, rising vertically another to the height of from 200 to 300 feet, afford views of the lovely scenery of the Hudson. The river is wider at this point than at any other; the broad Tappan Zee and Hackensack Bay are separated by the long peninsula known in Revolutionary times as Teller's Point where the Vulture waited for Arnold and Andre, and now, as Crutcher Underhill's Point, famous for its vineyards. The Crutcher aqueduct crosses the Kill brook by a magnificent stone arch of 88 feet span and 70 feet above the stream, and beneath this arch bridge is a second one for highway use. Among the articles manufactured here are porous plasters, pills, bakeware, self-feeding cotton-gins, cotton-gin cases, gas and water pipes, steam engines, fans, wringers, carriages, and sleighs. A soldiers' monument was unveiled here May 30, 1887. The village contains several churches, 4 boarding-schools for boys, 2 boarding-schools, military discipline, a boarding-school and day school for young ladies, 2 public schools, several private schools, a public library (founded in 1820), 4 other libraries, one of the most noted prisons in the U. S., gas and electric light, electric street-railways, a national bank with capital of \$1,000,000, a savings bank with deposits of over \$1,500,000, and a monthly, a quarterly, and 2 weekly periodicals. Pop. (1880) 6,578, (1890) 9,365.

M. F. ROWE, EDITOR OF "REPUBLICAN."

**Sinim**: the name used in the Bible for the Seres, or ancient Chinese. See CHINA.

**Sink-hole**: a hollow of the land drained at the bottom. Districts underlain by limestone or gypsum are often drained through subterranean channels, and the surface waters find their way to these channels through vertical crevices which are sometimes opened out into shafts of some size. The washing of soil, etc., into such shafts usually produces a funnel-shaped cavity, and this is known in the U. S. as a sink-hole or limestone-sink, and in England as a swallow-hole. Such hollows are abundant in the great Appalachian valley, which is underlain by limestone from Pennsylvania to Alabama. The word sink is sometimes inappropriately applied to drainless hollows which receive the water of streams, and discharge it to the air by evaporation. See PLAYA.

G. K. GILBERT.

**Sinking Fund**: See FINANCE (*Public Loans*).

**Sinnett, ALFRED PERCY**: journalist; b. in London, 1840; the son of E. W. Sinnett, a journalist; joined the staff of the London *Globe* in 1859; afterward edited *The Daily Press* at Hongkong; returned to England in 1868; went to Allahabad, India, in 1871, as editor of *The Pioneer*; joined the Theosophical Society in 1879, and, returning again to England in 1882, expounded theosophy to the British public in two widely circulated volumes, *The Occult World* (1881) and *Esoteric Buddhism* (1883).

H. A. BEERS.

**Sino'pe** (Gr. *Σινώπη*, Turk. *Sinûb*): town; in Asia Minor, in the vilayet of Castamouni (see map of Turkey, ref. 4-G). Situated on a peninsula with a splendid harbor, it was the most important of the Greek colonies on the Black Sea. It was the capital of the kingdom of Pontus. Mithradates the Great was born here (134 B. C.). During the Middle Ages it belonged to the empire of Trebizond, and was captured by Mohammed II. (1470). In its harbor the Ottoman fleet was defeated with a loss of 4,000 men and twelve ships by the Russian admiral Nachimoff (Nov. 30, 1853). This event decided France and Great Britain to interfere, and brought on the Crimean war. The town is well fortified, and has an arsenal and shipyard. It exports dried fruits, fish, skins, nuts, and tobacco. Pop. (1889) 7,162, of whom 2,840 are Greeks.

E. A. GROSVENOR.

**Sinters** [loan-word from Mod. Germ. *sinter* < O. H. Germ. *sintar*: O. Eng. *sinder* (the spelling *cinder* due to influence of Fr. *cendre* < Lat. *cinis*): a general designation for mineral substances deposited as incrustations or porous and cellular masses from the waters of mineral springs. The principal kinds are siliceous and calcareous sinters. Some siliceous sinters are classed by Dana with the crypto-crystalline varieties of quartz. They proceed from waters containing silica itself in solution, or sometimes, doubtless, soluble silicates of bases which are decomposed by the carbonic acid of the air. The great mass of siliceous sinters are composed of hydrates of silica. Florite, michaelite, and geyserite are names that have been given to some of these. Calcareous sinters are also called calcareous tufas. They are similar in nature and origin to the material of STALACTITES (q. v.).

**Sintra**: See CINTRA.

**Sinus**: See FISTULA.

**Sion, Mount**: See ZION.

**Sioot, or Siat**: See ASSIUT.

**Siouan** (soo'an) **Indians**: that linguistic stock or family to which the "Sioux" and cognate tribes of North America belong. According to Trumbull, Sioux, the popular appellation of the tribes which call themselves Dakota, Lakota or Nakota, is an abbreviation of Nadowessioux, which is a corruption of Nadowe-ssi-wag, "the snake-like ones" or "enemies" (derived from the Algonquin word *nadowe*, a snake). The characteristic languages are eminently vocalic and abound in inflections; agglutination and juxtaposition are also found.

**Tribes**.—The family comprises a number of tribes commonly arranged in ten groups, as follows: 1. (A) *Dakota* and (B) *Assiniboin*. The former includes the six Dakota sub-tribes, (a) Santee, comprising the Mde-wa-ka-to-wa (Spirit-lake village) and Waqpe-kute ("to shoot among deciduous trees"); (b) Sisseton (Sisito-wa"); (c) Wahpeton (Wa-qpeto-wa, "dwellers among deciduous trees"); (d) Yankton (Ihaŋkto-wa, "end village"); (e) Yanktonnai (Ihaŋkto-wa-na, "little end village"), divided into Upper Yanktonnai (including the Cut Head band or Pa-baksa gens) and Lower Yanktonnai; and (f) Teton (Ti-to-wa, "dwell-

ers on the prairie"), in seven divisions, namely, Brulé (Si-tea-xu, "burned thighs"), including Upper or Highland Brulé and Lower or Lowland Brulé; Sans Arcs (Ita zi-tes, "without bows"); Blackfeet (Sihasapa); Minneconjou (Mni-ko-oju, "planting beside streams"); Two Kettles (Oo-ho-no-pa, "two boilings"); Oglala (o-gla-la, "she poured out her own"), including the Wazaza and the Loafers (Waglu-xe, "inbreeders"); and Huŋk-papa (Uncpapa or Uncapapa). The tribal organization of the Assiniboin is uncertain; they are called Hohe (rebels) by the Dakota. 2. *Dhegiha* (or *Cegiha*, consisting of the tribes known as (a) Omaha (Uma-ha, "up-stream people"); (b) Kwapa or Quapaw (Uka-gpa, "down-stream people," the Arkansa or Arkansas of early writers); (c) Ponka or Ponca; (d) the Osage (Wacaca, etc.), divided into Little Osage (Ūtsēhta, "campers on the lowland"), and Big Osage (Pahe'tsi, "campers on the mountain"), and the "Arkansaw band" (Santsu'kei, "campers in a highland grove"); and (e) the Kansa (Kaw, Ka'ze, referring to the wind). 3. *Tciuere*, comprising (a) the Iowa (Pa'qote, "dusty noses" or "dusty heads"); (b) the Oto (Watota, "lovers of sexual pleasure"); and (c) the Missouri. 4. *Winnebago*, including only the Winnebago tribe (who call themselves Hotcaŋigara, "people of the parent speech"). 5. *Mandan*, consisting of the Mandan tribe. 6. *Hidatsa* (Minnetaree or Gros Ventres of the Missouri), consisting of (a) the Hidatsa and (b) the Crow (Absoroka or Absaruge, etc.) tribes. 7. *Tutelo* (Yesa'), comprising the Tutelo, Saponas, and cognate tribes. 8. *Biloxi* (calling themselves Tanēksha'yadi, including the Biloxi and very probably the Paskagula or Paskagoula tribes. 9. *Catawba* (Flatheads), comprising the Catawba, Woccon, and cognate tribes (ŋ Eutaw, ŋ Chickoree, ŋ Nachees, etc.). 10. The "Virginia group," composed of the Mannahak, Monacan, and cognate eastern tribes and confederacies (mainly extinct).

**Habitat**.—Excepting the Biloxi, Paskagula, Tutelo, Saponas, Catawba, and Woccon tribes, the territory of the Siouan Indians was mainly in one body, extending from about 33° N. in the Hudson Bay Company territory to about 33°, including a considerable part of the watershed of Missouri river and that of the upper Mississippi. The detached portion of Siouan territory on the E. was occupied by Catawba, Biloxi, etc. It comprised a portion of the present States of Virginia, North Carolina, and South Carolina. Contrary to current opinion, the general trend of Siouan migration has been westward.

**General Characteristics**.—The Dakota tribes were warlike. They were hostile not only to the white people and Indians of other families (especially the Ojibwa and Pawnee), but also to the Crow, Hidatsa, Mandan, Omaha, and other tribes of their own family. Many of the Dakota have come under the influence of Christianity, and are advancing toward civilization. The Omaha and the Ponka have been warlike, but they have never fought against the U. S.; this might be said also of the southern tribes of this family.

**Sociology**.—The civil and religious institutions are determined by kinship as expressed in terms of consanguinity and affinity. The unit of the social organization is the *gens*, which is usually characterized by one or more taboos. The religious and the legislative, executive, and judicial functions are not differentiated, being exercised by chiefs whose tenure of office is limited by age or other physical incapacity, or by misconduct. The chiefship descends from father to son, unless the ambition and influence of a near relative displace him. With some exceptions descent is in the male line, although the entire system of consanguinity and affinity bears traces of a period in which descent was in the female line. A plurality of wives is deemed essential to the amassing of wealth, which is one avenue to power; divorce is optional with the husband. Civil government, personal conduct, property rights, corporations or organized bodies of persons, war, and international relations are regulated by laws and compacts. Indirectly related to the civil government are two kinds of associations for religious, industrial, and other purposes, the first being the feasting organizations and the second the brotherhoods or dancing societies, to some of which the shamans belong. Murder and rape, as a rule, are punished or avenged by death at the hands of kindred of the victim.

**History**.—The Dakota were mentioned in the *Jesuit Relations* as early as 1639-40. In 1658 they had thirty towns W. N. W. from the mission St. Michel of the Potawatami; in 1689 they were on the upper Mississippi near St. Croix river. In the nineteenth century the Teton Dakota went into the Black Hills region, previously occupied by the Crow tribe.

The Assiniboin and Yankton moved from the upper Missouri country to the upper Mississippi in 1680. In 1680 the Assiniboin and Yankton moved from a formidable army of 1,000 warriors were killed. Spotted Tail, Red Cloud, Crazy Horse, Sitting Bull, American Horse, and several other chiefs were particularly noted. Assiniboin life, however, was among the most famous Dakota chiefs and warriors of the nineteenth century. An outbreak of serious pestilence was undoubtedly caused during the ghost dance activities at Pine Ridge agency in the winter of 1900-1901. In 1901 the Assiniboin were moved to Canada and over 27,000 of the U. S. shells in North and South Dakota, Montana, and Nebraska.

Humboldt (1806) described the Assiniboin as dwelling S. E. of the Iowa (Kaw) river, or Mankato river, who were the Knife Lake. Minnesota. The present map of 1881 placed Assiniboin Lake in the Woods, then called Knife Lake Assiniboin. They were near this lake in 1700, when they were said to have 1,000 warriors. In 1829 they were W. of the Missouri and N. of the Missouri and Assiniboin rivers, with a population of 9,000. Breaks numbered them at 10,000 before the smallpox epidemic of 1838 that epidemic reduced off 4,000. Since 1840 they have been decreasing in numbers. In 1880 there were about 1,000, mostly in Canada. Some 200 were at Fort Park reservation, Montana.

According to tribal traditions, the Omaha, Ponka, Kiowa, Comanche, and Kiowa tribes were originally one people, dwelling on the Ohio and Wabash rivers. A separation took place as early as 1600 as it is proved by the discovery of the Mississippi. Those who went down the Mississippi became the Kiowa, and those who went up the river the Omaha. The Omaha settled on Nebraska river. The Omaha subsequently occupied the country between Corrington, Neb., on the N. part Omaha river up the N. ranging W. as far as the Ponka and Ponka. About the beginning of the nineteenth century they were near Omaha, Neb. In 1820 they were said to be 12,000. They are citizens of the U. S. and Nebraska.

Although Omaha, the name Ponka does not appear in history till 1700. The Ponka were met by Lewis and Clark in 1804, when they had been reduced by the smallpox to about 200. In 1829 they numbered 900; in 1842, 900; and in 1871, 147. Prior to that time they had been friends of the Lakota; but a cession of lands to the Sioux reservation made the tribes enemies. The warfare continued until the Lakota, possessors of the Ponka title to the Indian Territory in 1877. A commission appointed in 1880 visited both portions of the Ponka, and their investigations resulted in a decision in favor of the title. Those who agreed to remove to the South are said to be prospering. In 1890 they numbered over 600, with those in Nebraska numbered 217.

The Kiowa were found in 1541 by de Soto on the Mississippi, above the St. Francis apparently near the site of the present New Madrid. La Salle (1681) found them in some villages along the Mississippi. The earliest mention of "Arkansas" was in 1682, La Salle's journal says the greater part of the Kiowa lived on the smallpox in 1680, another, while Staley (1895) says the Arkansas were in three villages about 12 miles above Arkansas Post. The Kiowa were friendly with the Comanche, though of another language family. In 1877 the Kiowa were on their reservation in the Indian Territory, but most of them later removed to the Crow country. Their total number in 1890 was 202.

The Crow were mentioned by Marquette (1673) as the "Crow" and "Arkansas". In 1829 Porter gave their number as 5,000, and described their country as beginning 35 miles W. of the Missouri line, running to the Mexican line of demarcation being 30 miles wide. Schoelkopf said that in 1800 they numbered 2,700. In 1804 they were on the Crow reservation, Arkansas. In 1800 they numbered 1,581.

When the cession of Louisiana to the U. S., a treaty was made with the Kiowa tribe was made by the Government. They were on the Arkansas river, at the mouth of the Saline, and numbered about 1,000 in 1800 north of the river. In 1825 they numbered about 1,000 on the Missouri, entering a reservation in 1830. In 1830 they again entered their lands, and the Government was assigned them on the Crow river, in Kansas. They were again assigned, and a new reservation assigned in Indian Territory. In 1880 they numbered 214.

In 1881 Jeffers found the Iowa Indians on the east side of Missouri river, W. of the mouth of the Missouri river, where

the Oto, and Pawnee, the Iowa (Omaha) Indians (1882) said that in 1835 they numbered 800, and in 1871 400. They were on the Missouri river, in the southwest. Part of the Iowa were removed to the Crow and Crow reservation in 1881. In 1881 they numbered 1,000. The Iowa numbered the Crow (Omaha) reservation, Kansas. Their number in 1880 was 714.

The Oto was the third tribe to separate from the Winnebago, the Iowa being the first and the Missouri the second. In 1875 they were moved by Marquette (1875) to 41 N. and W. of Missouri river, E. of the Mouth (Omaha) and S. E. of the Pawnee (Pawnee) or Pawnee. In 1881 they were 100 leagues from the Illinois, almost opposite the mouth of the Missouri, Wisconsin river, and in 1887 they were on the Crow river. In 1881 they numbered the Iowa and the Oto, the Oto, the Winnebago, the Missouri, and the Crow, about 100 leagues from the Illinois river. In 1882 they found the Oto and Missouri together in the Pawnee country. In 1881 they were with the Missouri on the Pawnee, Pawnee and Crow reservation, Oklahoma. Together with the Missouri they numbered nearly 400.

The name Missouri first appeared about 1607. Their village was placed by Bourgeois (1735) at 100 leagues below Kansas river, and 100 leagues below the principal Kansas village. The tribe formerly lived at the mouth of Missouri river, but gradually moved that stream. About 1780 or 1800 they were displaced by the Crow and Fox and other Indians. Five or six lodges joined the Crow tribe, two or three took refuge with the Kiowa, and most of the remainder amalgamated with the Oto. In 1801 Lewis and Clark found the Missouri in villages S. of Platte river, numbering 300 souls. They were with the Oto in 1804, when they numbered 50, and followed them to Indian Territory in 1805.

The Winnebago are closely related to the Iowa, Oto, Missouri, and Mandan. The earliest mention of the name was in the *Journal of LaSalle* of 1640. LaSalle found them on Green Bay, Wisconsin, in 1640. Kelton says that they derived their name from their former residence on Winnebago Lake, called by the Assiniboin tribes near at Winnebago, early water. In 1811 Pike named seven Winnebago villages. In 1822 the Winnebago population was estimated at 5,000, with 600 warriors. By treaties in 1825 and 1834 they ceded all their land S. of Wisconsin and Fox river for a reservation on the Mississippi above the Omaha. One of their villages in 1832 was at Prairie la Poudre. During their third visitation of smallpox, in 1836, more than one-fourth of the people perished. In 1837 they relinquished their title to the country E. of Missouri river, and in 1840 removed to the Territory of Iowa. In 1840 they surrendered their reservation for one above Minnesota river, and in 1850 removed to Blue Earth, Minn., and thence to a new reservation on the Omaha lands above Fort Randall, where they occupy lands allotted in severalty. In 1880 there were 1,215 here, with nearly 1,000 elsewhere, chiefly in Wisconsin.

The Mandan settled about 1700 on Missouri river, near the mouth of Heart river, in new villages; they afterward ascended the river to a point 1,400 miles above the mouth. In 1807 the Mandan were almost destroyed by the smallpox, they being left only thirty-one according to one account, though others vary from 125 to 145, out of 1,600. About 1872 a reservation was set apart for the Mandan, Hidatsa, and Arikara, in Dakota and Montana, along Missouri and Yellowstone rivers. In 1890 the Mandan numbered 262.

The Hidatsa were formerly known as the Minutemen or Gros Ventres of the Missouri, and so were often confounded with the Minutemen or Gros Ventres of the Plains, or the Arikara, of the Arikara family. In 1706 there were three villages of this tribe on Knife river, in what is now North Dakota. The largest, Hidatsa, gave its name to the tribe. After the smallpox epidemic of 1837, the villages united. In 1845 the Hidatsa tribe (and about the same time the Mandan) moved up the Missouri and established a permanent village 70 miles by land and 60 by water from their old home. They were joined by the Arikara in 1802. In 1800 the Hidatsa on Fort Berthold reservation numbered 522.

The real name of the Crow tribe, which is Arikara or Arikara (Hoffmann) does not mean "crow," but refers to a species of hawk. When met by Lewis and Clark the Crow were in four bands. In 1817 Brown located them on Yellowstone river. The Indian Report of 1832 gave the number as 3,000, inhabiting the head waters of the Yellowstone. They were later gathered on the Crow reservation, Montana, and in 1890 numbered 2,287.

The Flathead or Yankton was the leading tribe of the seventh group of Stouan Indians. To this group belonged the

Sapona and probably the Occaneeche or Akenatz, Keyanwee, Shoccorie, Stenkenock, and Meipontsky tribes. The Tutelo were first referred to by Capt. John Smith. They were in Southern Virginia in 1671, according to Batt; in North Carolina in 1714, according to Lawson. They and the Sapona returned to Virginia, and in the eighteenth century, with the Nottoway and Meherrin, migrated into Pennsylvania and subsequently joined the Six Nations. At the close of the Revolutionary war the Tutelo followed the Six Nations into Canada, settling on Grand river reservation, Ontario. The tribe was nearly exterminated by smallpox in 1848, and the last survivor died in 1870.

In 1669 the Biloxi had one village on Biloxi Bay, near the Gulf of Mexico; thirty years later there were three villages, Biloxi, Paskagula, and Mactobi. In 1804 the Biloxi were on Red river, and in 1828 they were reduced to twenty families on Neches river, Texas. In 1894 about twenty-five of the tribe survived in Lecompte, Rapides parish, La.

Of the Catawba tribes, those mentioned earliest were the Wateree and St. Helena, seen by Juan Pardo's expedition in 1567. In the earlier part of the next century the Catawba proper (who were called Flatheads) were on Catawba creek, in Botetourt co., Va., and may have occupied the adjoining county, Roanoke, where there is now a settlement bearing their name. About 1660 they migrated to South Carolina. Lawson (1701-02) spoke of the Kataba on Catawba river, South Carolina, as Esaw, and distinguished them from the Kadapaw on Lynchess creek. Adair states that in 1743 the Catawba had 400 warriors; Ramsay (1795) that in 1780 they numbered 490 with 150 warriors. In 1780 they withdrew before Cornwallis to Virginia, where some of them joined the American army, returning to establish themselves in two new villages. About 1841 they sold to the State of North Carolina 14 sq. miles of their territory, reserving only 1 sq. mile and a tract of land on the east side of Catawba river. At that time, as also in 1890, they numbered about 120.

The Mannahock confederacy of Virginia consisted of about a dozen tribes, of which the names of eight have been preserved. Their habitat was between tide-water and the Blue Ridge. Of the Monacan confederacy of Virginia five tribes were named by Capt. John Smith, Lederer, and Jefferson. Both confederacies are extinct.

For a description of the manners, customs, etc., of the Siouan Indians (with others), see INDIANS OF NORTH AMERICA.

JAMES OWEN DORSEY.

**Sioux (soo) City:** city; capital of Woodbury co., Ia.; at the junction of the Big Sioux and Missouri rivers; on the Chi., Mil. and St. P., the Chi., St. P., Minn. and Om., the Ill. Cent., the Sioux City and North., the Sioux City and Pac., the Sioux City, O'Neill and W., and the Union Pac. railways; 80 miles S. of Sioux Falls, S. D., and 100 miles N. by W. of Council Bluffs (for location, see map of Iowa, ref 4-C). It is the second city in size in the State, has a large frontage on the Missouri river and a picturesque residence quarter on high bluffs, and is an important commercial center. It is the gateway to South Dakota, the upper Missouri region, and the Black Hills mining and grazing country.

**Public Interests.**—The city has all the modern improvements: water-works (cost \$1,000,000); 51 miles of electric and 8 miles of elevated railway; gas and electric lights; over 40 miles of sewers; 25 miles of paved streets; city-hall and public library (cost \$80,000); police building (\$30,000); county courthouse; U. S. Government building (\$250,000); Y. M. C. A. building (\$60,000); 2 hospitals; a Union dépôt (\$600,000); and a bridge across the Missouri river (\$1,000,000). There are over 40 churches, several of which cost from \$50,000 to \$75,000 each; 80 public-school buildings (cost over \$650,000), including a high-school building that cost \$130,000; the University of the Northwest, and 3 daily and 13 weekly papers.

**Business Interests.**—The census returns of 1890 showed

195 manufacturing establishments (representing 50 industries), with a combined capital of \$4,938,606, employing 2,997 persons, paying \$1,862,612 for wages and \$10,329,994 for materials, and turning out products valued at \$14,164,667. In 1895 there were 5 meat-packing houses with a capacity for slaughtering and packing 13,000 hogs, 3,000 cattle, and 1,600 sheep per day. Over \$6,000,000 was invested in manufacturing. The principal productions were stoves, engines, shoes, flour, soap, starch, wagons, plows, tile, brooms, furniture, and clothing. The jobbing trade amounts to about \$30,000,000 per annum. There were 17 banks of all kinds, having a combined capital of \$3,575,000 and a surplus of \$940,000, and 2 loan and trust companies.

**History.**—The city was settled by traders in 1849, was an important Government post during the early Indian troubles, and was the outfitting point for the Black Hills expeditions. It achieved great fame from its corn palaces, beautiful structures decorated with grains, grasses, and other products of the soil. Five were built, in which annual fairs and festivals were held, lasting a month. Since the palaces were abandoned annual interstate fairs have been held at Riverside Park, a beautiful retreat in the suburbs, with ample grounds and a race-track.

Pop. (1880) 7,366; (1890) 37,893; (1895) estimated, over 40,000. ORA WILLIAMS, MANAGING EDITOR OF "JOURNAL."

**Sioux Falls:** city (incorporated as a town in 1877, as a city in 1888); capital of Minnehaha co., S. D.; on the Big Sioux river, and the Burl., Cedar Rap. and N., the Chi., Mil. and St. P., the Chi., St. P., Minn. and Om., the Great N., and the Ill. Cent. railways; 90 miles N. of Sioux City, Ia. (for location, see map of South Dakota, ref. 7-G). It is in an agricultural and stone-quarrying region; has large stock-raising interests; derives great power from the river, which falls nearly 100 feet in a series of cascades within a distance of half a mile; and contains water-works, sewers, and gas and electric-light plants. The streets are paved with jasper, quarried near the city, and many buildings are constructed with the same stone. There are 30 churches, 7 public-school buildings, public-school property valued at over \$175,000, Sioux Falls University (Baptist), All Saints' School (Protestant Episcopal), a Norwegian-Lutheran college, a business college, the State School for Deaf Mutes, the South Dakota penitentiary, 4 national banks with combined capital of \$450,000, 3 State banks with capital of \$200,000, and 2 daily, 7 weekly, and 3 monthly periodicals. Sioux Falls is the seat of the Protestant Episcopal bishopric of South Dakota and of the Roman Catholic bishopric of Sioux Falls. Pop. (1880) 2,164; (1890) 10,177; (1894) 13,564.

CHARLES M. DAY, EDITOR OF "ARGUS-LEADER"

**Siphon** [from Lat. *si'pho*, *sipho'nis* = Gr. *σιφών*, reed, pipe, tube, siphon]: a bent tube for conveying water from a reservoir, A, to a lower level, C, over an elevation, B, which is not more than 33 feet higher than A. To put the siphon into action the air must be exhausted, and then the atmospheric pressure on the surface of the water at A causes the water to rise and flow over, with a velocity depending upon the difference of level between A and C. The siphon is used for emptying casks, and sometimes on pipe-lines for water-works, but in the latter case a pump is placed at B, in order to remove the air which otherwise accumulates there and diminishes the flow. See HYDRAULICS. M. M.

**Siphonap'tera** [Mod. Lat., from Gr. *σιφών*, tube + *ἄνερος*, wingless]: an order of insects which contains the fleas. See ENTOMOLOGY.

**Siphonap'ta** [Mod. Lat., deriv. of *sipho* = Gr. *σιφών*, tube]: one of the two divisions into which the lamellibranch molluscs (clams, etc.) were formerly divided, the name being given in allusion to the fact that the posterior edges of the mantle were united with a tube (familiar in the so-called "head" of the common clam). See LAMELLIBRANCHIATA.

**Siphonoph'oræ** [Mod. Lat., from Gr. *σιφών*, tube + *φόρος*, bearing]: a group of HYDROZOA (q. v.) characterized by the formation of free-swimming colonies, the individuals of which have become highly differentiated. These individuals are each modified jellyfishes, and are connected by a tube, whence the name. In a typical form the following individuals may occur: (1) A float, to suspend the colony, occurring

the sides and all the tubs. All swimming bolls all floating  
bolls, 10, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100, 101, 102, 103, 104, 105, 106, 107, 108, 109, 110, 111, 112, 113, 114, 115, 116, 117, 118, 119, 120, 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200, 201, 202, 203, 204, 205, 206, 207, 208, 209, 210, 211, 212, 213, 214, 215, 216, 217, 218, 219, 220, 221, 222, 223, 224, 225, 226, 227, 228, 229, 230, 231, 232, 233, 234, 235, 236, 237, 238, 239, 240, 241, 242, 243, 244, 245, 246, 247, 248, 249, 250, 251, 252, 253, 254, 255, 256, 257, 258, 259, 260, 261, 262, 263, 264, 265, 266, 267, 268, 269, 270, 271, 272, 273, 274, 275, 276, 277, 278, 279, 280, 281, 282, 283, 284, 285, 286, 287, 288, 289, 290, 291, 292, 293, 294, 295, 296, 297, 298, 299, 300, 301, 302, 303, 304, 305, 306, 307, 308, 309, 310, 311, 312, 313, 314, 315, 316, 317, 318, 319, 320, 321, 322, 323, 324, 325, 326, 327, 328, 329, 330, 331, 332, 333, 334, 335, 336, 337, 338, 339, 340, 341, 342, 343, 344, 345, 346, 347, 348, 349, 350, 351, 352, 353, 354, 355, 356, 357, 358, 359, 360, 361, 362, 363, 364, 365, 366, 367, 368, 369, 370, 371, 372, 373, 374, 375, 376, 377, 378, 379, 380, 381, 382, 383, 384, 385, 386, 387, 388, 389, 390, 391, 392, 393, 394, 395, 396, 397, 398, 399, 400, 401, 402, 403, 404, 405, 406, 407, 408, 409, 410, 411, 412, 413, 414, 415, 416, 417, 418, 419, 420, 421, 422, 423, 424, 425, 426, 427, 428, 429, 430, 431, 432, 433, 434, 435, 436, 437, 438, 439, 440, 441, 442, 443, 444, 445, 446, 447, 448, 449, 450, 451, 452, 453, 454, 455, 456, 457, 458, 459, 460, 461, 462, 463, 464, 465, 466, 467, 468, 469, 470, 471, 472, 473, 474, 475, 476, 477, 478, 479, 480, 481, 482, 483, 484, 485, 486, 487, 488, 489, 490, 491, 492, 493, 494, 495, 496, 497, 498, 499, 500, 501, 502, 503, 504, 505, 506, 507, 508, 509, 510, 511, 512, 513, 514, 515, 516, 517, 518, 519, 520, 521, 522, 523, 524, 525, 526, 527, 528, 529, 530, 531, 532, 533, 534, 535, 536, 537, 538, 539, 540, 541, 542, 543, 544, 545, 546, 547, 548, 549, 550, 551, 552, 553, 554, 555, 556, 557, 558, 559, 560, 561, 562, 563, 564, 565, 566, 567, 568, 569, 570, 571, 572, 573, 574, 575, 576, 577, 578, 579, 580, 581, 582, 583, 584, 585, 586, 587, 588, 589, 590, 591, 592, 593, 594, 595, 596, 597, 598, 599, 600, 601, 602, 603, 604, 605, 606, 607, 608, 609, 610, 611, 612, 613, 614, 615, 616, 617, 618, 619, 620, 621, 622, 623, 624, 625, 626, 627, 628, 629, 630, 631, 632, 633, 634, 635, 636, 637, 638, 639, 640, 641, 642, 643, 644, 645, 646, 647, 648, 649, 650, 651, 652, 653, 654, 655, 656, 657, 658, 659, 660, 661, 662, 663, 664, 665, 666, 667, 668, 669, 670, 671, 672, 673, 674, 675, 676, 677, 678, 679, 680, 681, 682, 683, 684, 685, 686, 687, 688, 689, 690, 691, 692, 693, 694, 695, 696, 697, 698, 699, 700, 701, 702, 703, 704, 705, 706, 707, 708, 709, 710, 711, 712, 713, 714, 715, 716, 717, 718, 719, 720, 721, 722, 723, 724, 725, 726, 727, 728, 729, 730, 731, 732, 733, 734, 735, 736, 737, 738, 739, 740, 741, 742, 743, 744, 745, 746, 747, 748, 749, 750, 751, 752, 753, 754, 755, 756, 757, 758, 759, 760, 761, 762, 763, 764, 765, 766, 767, 768, 769, 770, 771, 772, 773, 774, 775, 776, 777, 778, 779, 780, 781, 782, 783, 784, 785, 786, 787, 788, 789, 790, 791, 792, 793, 794, 795, 796, 797, 798, 799, 800, 801, 802, 803, 804, 805, 806, 807, 808, 809, 810, 811, 812, 813, 814, 815, 816, 817, 818, 819, 820, 821, 822, 823, 824, 825, 826, 827, 828, 829, 830, 831, 832, 833, 834, 835, 836, 837, 838, 839, 840, 841, 842, 843

Strophomena, etc. - 1870

[illegible]

Stokholm Bay or Sirbanic Lake, formerly a large, shallow body of water separated from the Mediterranean by a low strip of shore, and extending eastward from Poldstun to Rector. It is now dry and covered with sand. At the beginning of the Christian era Strabo (*Geog.* i, 3, 4) speaks of it as a marsh, and not previously Diodorus reported that it was covered with reeds and papyrus. These statements do not agree with the further statements of Strabo (*ib.* 2, 33, and 4, 44) that it was a deep body of heavy water into which one could not flow, and that asphalt or bitumen came to the surface near the middle of it, whence it was gathered for such use. One of the principal routes to Syria had about the narrow neck between sea and lake, but it was dangerous in certain states of wind and tide. Antiochus is said to have put a post of his army when attempting the passage. The bridge of the Cardus proposed by Berosus illustrates the weakness of the bog to the Romans, but the discovery of one class of Ptolemy's coastlines has thrown his localizing and routing errors of the literature about midway of the century.

CHARLES R. GILLET.

Dr. Martin - Mrs. Sign Banta

and from Alca, Ind., from *Cr. asperior* both collections  
of *Asperior* were first applied to the animal  
of Alca, but were determined to include the large larva  
which was not quite of several species of salamanders belonging  
to the genus *Amphysotoma*.

[illegible]

... a lot of responsibility for the drop in the finished ...  
... an order of magnitude contribution, can be made ...

known as sea urchins. They are adapted for bottom life and progression in themselves, but less qualified than those Anomura. The form is bell-like, the shell short and hard, shell to protection is the body. Joint limbs are present as always, but limbs are absent. The body ends in a transversely flattened tail which may be rounded up in the summation, or, in the distally, turned like the sides of a wheel. The limbs are rather provided than of the higher invertebrates but a minute for the compound and observation of the coelom, the apical and basal, distally narrow and the distal part of the coelom. Many teeth adapted for the treatment of food, are to the apex of both lower, the most is much more, and the second coelom has a distinct subventral process, the lower is deeply fissured below the ventral. The species are all herbivorous, and feed upon the organic food coming on the bodies of substances and even as did in the water. When at rest they remain upright from the bottom and the water by their tail, but with the head downward and the back consequently arched at intervals of about one minute, and resting and quivering they rise to the surface, and the surface of the body open and that as they come to the surface and go downward again. The order is now represented by two families, *Porchasteridae*, including the porchaster and *Heliosoridae*, containing the Heliosora. Up to the end of the last century a hard body *Heliosora* lived in the North Pacific during the sea, but its only living species was in a short time exterminated by the attacks of man. The earliest extant representatives of the order are known as of Eocene age and since then several peculiar forms have flourished and died out. See Dawson and McArthur.

Revised by F. A. Lucas.

Stronghold, 2000, by David Laundy

**SIRENS.** [*phryx*, of *Siren* = Lat = for *Sappho* play of *Sappho*, the *Sirens*]. In Greek mythology, *trachinotus* who lived on an island between Sicily and the coast of France, and by their marvellous songs, lured sailors to their ruin, for whom needed their straggling men too with no home again. It was fated that the *Sirens* should die in some way and should pass by without hearing their singing. *Odysseus* escaped their allurement only by stuffing his companions' ears with wax and having himself securely fast to the mast. The *Argonauts* escaped their luscious lures were charmed by the soporific singing of *Uphonus*. The *Sirens* were changed for one reason or the other to drunken rocks located at *Pelorum* or *Siretois*, or *Cape*, or the *Sirenum*. In earliest times they were represented as birds with the heads of maidens, and later as creatures with the body of a mermaid and the face and wings of a bird. J. R. S. STANLEY.

**Spiritus** [as Int. = (fr. *Believe*): the day-star, a star of China, maybe, the brightest star in the heavens. It may be seen in the S. H. the winter evenings. From the appearance of several ancient writers it is sometimes claimed to have been red in ancient times, though from a brilliant white, but the question of the former color is not yet settled. It was formerly believed to generate a powerful and, consequently, a harmful influence upon human affairs.

## Received by S. Newcomb.

**Silene**'co [= Ital., from Arab. *silyne*, deriv. of *sharyn*, nutmeg, root, deriv. of *sharqiyah*, rose, cf. Sanskrit]; a herb, or trailing weed, which rises in the Sahara, then flows as far as the Meschiterraean, where it becomes nearly become filled with greenness, and finally over Sicily, Southern Italy, Wales, etc. It generally comes in spring and autumn, but for one or two days, though sometimes for a whole week, and is very important to vegetable and animal life, causing general exuberance about vegetation, and mental depression.

**Sisal Hemp** (named from *Sisal*, a part of Yucatan); the fiber of various species of *Agave* (e.g., *Sisal hemp* is produced in considerable quantities in Yucatan and at Key West, Fla. and other localities. It ranks excellent material, somewhat like that of *Arbo* hemp, but it is chiefly made into hammocks of great strength and durability.

*Stilesia*, or *Clusia*, is one of the several features of the genus *Chapmania*, native of the West Indies of North America. The young and speciose are the *St. nana*, which makes greenness and the *St. long* of the deep water of Lake Michigan. There are recognizable by their leaves like *Stilesia*, but not much with the longer and longer, short and somewhat more green and the long and supererect, supererect leaves. They are small, rapidly weighing as much as a pound. The *St. nana* is the best of the slender bushes. It is in some places exceedingly abundant.

**Sis'cowet, Siskowit, or Siskawitz** [from native (Amer.-Ind.) name]: a variety of the great lake-trout (*Salvelinus namaycush*, var. *siskawitz*), found in Lake Superior. It is similar to the namaycush, but is less elongated, and becomes extremely fat.

**Sisen'na**, LUCIUS CORNELIUS: historian; b. about B. C. 119; was prætor B. C. 78; defended Verres in 70, and died B. C. 67 in Crete, being at the time legate of Pompey in the war with the pirates. Having been an actor in public affairs, he was well fitted to relate the events of his own time (including the Social war and the civil wars of Sulla) in his work entitled *Historiæ*, written in an archaic style. Cicero says of him (in his book on *Laws*) that he surpassed all previous Latin historians, and Sallust highly praises his diligence. Sisen'na translated also into Latin the Milesian tales (*Μυληνικά*) of Aristides. Whether the Sisen'na who wrote commentaries to several plays of Plautus is the same is disputed. Only fragments of the *Historiæ* remain, collected by Peter in *Hist. Roman. Fragmenta*, pp. 175-189.

Revised by M. WARREN.

**Siskin** [from Dan. *siegen*, or Swed. *siska*; Germ. *zeisig*, from Sloven. *čizek*: Polish *tyż*, siskin]: an Old World bird, *Spinus* or *Chrysomitris spinus*, of the family *Fringillidæ*. The male is a prevailing olive green above and yellowish white below, streaked with black on the back and sides, and with a black throat and crown. It is a favorite cage-bird. The pine-siskin (*S. pinus*) and the American goldfinch are related North American species.

**Sismon'di**, JEAN CHARLES LÉONARD SIMONDE, de: historian and political economist; b. at Geneva, Switzerland, May 9, 1773; educated in the college of his native town, and was a clerk in a large counting-house in Lyons; political disturbances drove his family into exile, and he lived in England and later in Italy for several years; settled finally in his native town in 1800; devoted himself to studies and literary work, though at the same time participating very actively in politics; married in 1819 an English lady. D. near Geneva, June 25, 1842. His first work was a treatise on political economy, *De la Richesse commerciale* (1803), based on the ideas of Adam Smith, which, however, he afterward abandoned, and even opposed, in his *Nouveaux Principes d'Économie politique* (2 vols., 1819) and *Études sur les Sciences sociales* (8 vols., 1838). His acquaintance with Madame de Staël, Benjamin Constant, Guizot, etc., turned his attention from political economy to history, and it was as an historian that he acquired his great celebrity. His *Histoire des Républiques italiennes du moyen âge* (16 vols.) appeared at Zurich in 1807-18; *La Littérature du Midi de l'Europe* (4 vols., 1813) was translated into English by Thomas Roscoe in 1823. Of his principal work, *Histoire des Français* (81 vols., 1821-44), he gave an abstract, *Précis de l'Histoire des Français* (2 vols., 1839). See *Sismondi, Fragments de son Journal et de sa Correspondance avec Mlle. de Sainte-Aulaire* (1863), *Lettres inédites à Madame d'Albany* (1864), and another collection of *Lettres inédites* (1878).

**Sistan**: See SEISTAN.

**Sisterhoods**: in the religious sense, unions of women devoted by public vows to religious work. They are in idea nearly as old as monasticism, for female branches of all the principal monastic orders were organized by the original founders, whose members are called nuns, and are technically spoken of as female religious. A distinction should be made, however, between a sister and a nun, for the former, unlike the latter, is not shut up in a convent, nor given up to contemplation and ascetic practices. Sisterhoods in the strict sense are modern, for the first one, still the most famous of all, was founded by St. Vincent de Paul in 1629, and is known variously as Daughters or Sisters of Charity, Gray Sisters, and Sisters of St. Vincent de Paul. (See article CHARITY, SISTERS OF.) There are now many sisterhoods, all doing similar work. One of them, the Irish Sisters of Charity, founded in 1815, uses an adaptation of the Jesuit rule. The vows of all are the monastic ones of poverty, celibacy, and obedience. To these are added, in some cases, other obligations. The sisters wear a distinctive dress, and have houses to live in and start from on their daily round of labor.

Protestant women, although equally devoted to the relief of suffering, do not, as a rule, favor sisterhoods. They prefer to work independently. Besides, they resent the implication of the vow as to "chastity," that the married relation

is in any sense derogatory, instead of being in every respect an honor and glory to woman, and that it is a hindrance to spiritual life, whereas it is a divinely ordered help. Protestant sisterhoods date from the revival of what is called "Catholic" teaching in the Church of England. The first sisterhood in the Church of England was founded by Dr. Pusey in 1845. The Society of the Holy Trinity was founded at Devonport in 1847, and many others have since been organized. One of the largest is Sisters of the Poor, founded in 1851. The saintly Sister Dora (Dorothy Pattison, 1832-78) belonged to the Sisterhood of the Good Samaritans.

The first Protestant sisterhood in the U. S., the Sisterhood of the Holy Communion, was founded by Rev. Dr. W. A. Muhlenberg in New York in 1852. It took charge of St. Luke's Hospital in that city in 1859, and St. Johnland in 1866. The Sisterhood of St. Mary was founded in New York in 1865. There were in 1895 nineteen sisterhoods in the Protestant Episcopal Church, four being branches of English ones.

The Protestant sisterhoods differ somewhat in methods and objects, but agree in promoting a combination of piety and good works. They pay particular attention to the inner life, and strive to put the spiritual force thus gained to practical account. In dress their members resemble those in the Roman Catholic Church, except that they do not cover up the hair. They take vows, but not irrevocable ones, although it is very seldom that a woman leaves a sisterhood. For the allied order of Deaconesses, see DEACONESSES.

*Sadlier's Catholic Directory* (New York) annually gives the figures for the Roman Catholic sisterhoods in the U. S. and Canada, and the *Catholic Directory*, published in Dublin, those for Great Britain and Ireland. For the sisterhoods in the Church of England, see the yearly list in the *Kalendar of the English Church* (London). For those in the Protestant Episcopal Church see the *Living Church Quarterly* (Milwaukee, Wis.). On the general subject, see Mrs. Jamieson, *Sisterhoods of Charity* (London, 1855); Mary Goodman, *Sisterhoods in the Church of England* (1863; 2d ed. 1865); J. M. Ludlow, *Woman's Work in the Church* (1865); W. A. Muhlenberg, *Evangelical Sisterhoods* (New York, 1867); C. E. Stephen, *The Service of the Poor* (London, 1870); H. C. Potter, *Sisterhoods and Deaconesses at Home and Abroad* (New York, 1871); C. C. Grafton, *Vocation; or, The Call of the Divine Master to a Sister's Life* (1886).

SAMUEL MACAULEY JACKSON.

**Sisters of Charity**: See CHARITY, SISTERS OF.

**Sisters of Mercy**: a Roman Catholic religious sisterhood, founded at Dublin, Ireland, in 1827, by Miss Catherine McAuley. The rule is similar to that of the Presentation nuns. Originally each convent was independent, but offshoots from the parent house, especially outside of Ireland, are usually subject to it. These religious women are always under the jurisdiction of the bishop in whose diocese they are located. They were introduced into the U. S. in 1843, at Pittsburg. Their convents are more than 200 in number, and the sisters are chiefly occupied in the conduct of parochial schools, private academies, hospitals, and homes for the aged. See *Life of Mother Catherine McAuley, Leaves from the Diary of a Sister of Mercy*, and *Hoffman's Catholic Directory* for 1895. J. J. KEANE.

**Sisto'va**: town and fortress; in Bulgaria, on the Danube, between Nicopolis and Rustchuk (see map of Turkey, ref. 8-D). It manufactures leather and cotton goods and carries on a large trade in wheat and wine. The treaty of Sistova was signed here between the Ottoman empire and Austria (1791), and the Russians crossed here in 1877. Pop. (1893) 13,212. E. A. G.

**Sis'yphus** (Gr. *Σίσυφος*): in Grecian mythology, son of Æolus, father of Glaucus, grandfather of Bellerophon, and king and founder of Corinth. Because of his wickedness Zeus sent Death to take him to Hades; but Sisyphus bound Death and held him long time prisoner, so that no one died until Death was finally released by Ares. For this reason (though other reasons also are given) Sisyphus, when finally he had come to the house of Hades, was doomed to roll to the top of a high mountain a huge rock, which always broke away from him just as the top was being reached.

J. R. S. STERRETT.

**Sit'ka** (formerly NEW ARCHANGEL): capital of Alaska Territory, on Baranof island, near the Pacific coast, in lat. 57° 2' N. (see map of Alaska, ref. 4-H). It has a harbor that is deep and commodious, but is difficult of ingress and egress. It was founded by the Russians in the eighteenth

voted himself to the study of Thomas à Kempis. D. at Upsala, Mar. 14, 1828. The complete works of Vitalis were published at Stockholm in 1878. D. K. DODGE.

**Skagerrak**, or **Skager-Rack**: an arm of the North Sea, 80 miles broad, extending between Norway and the Danish peninsula of Jutland, and connecting the German Ocean with the Cattegat or Kattegat. The current generally sets E. along the coast of Jutland, where the depth varies between 30 and 40 fathoms, and W. along the Norwegian coast, where the depth generally is 200 fathoms. There is neither haven nor good anchorage on Jutland, but good harbors abound on the opposite coast.

**Skaneateles**, skān-ē-āt'lēz: village (settled in 1796, incorporated in 1833); Onondaga co., N.Y.; at the outlet of Lake Skaneateles; on the Skan. Railroad; 7 miles E. by N. of Auburn, 18 miles W. S. W. of Syracuse (for location, see map of New York, ref. 4-F). It is in an agricultural and teasel-growing region; derives good power for manufacturing from the lake; contains flour-mills, woolen-mills, iron-works, hydraulic lime-kilns, printing-paper mill, carriage-factories, Union School and Academy, public library (founded in 1877), a State bank with capital of \$60,000, a savings-bank, and two weekly newspapers, and is a popular summer resort. Pop. (1880) 1,669; (1890) 1,559; (1895) estimated, 1,700. EDITOR OF "FREE PRESS."

**Skate**: a name given to certain species of fish of the family RAJIDÆ (q. v.). See also RAJÆ.

**Skeat**, skēt, WALTER WILLIAM: clergyman and philologist; b. in London, England, Nov. 21, 1835; educated at King's College School and at Sir R. Cholmeley's school, Highgate; graduated at Cambridge University 1858; became a fellow of Christ's College 1860; took orders in the Church of England; curate 1860-64; became lecturer on mathematics at Christ's College Oct., 1864, and subsequently lecturer on English; was in 1873 one of the founders of the English Dialect Society. A prolific and useful writer and editor, he has published some forty works, among which are the following for the Early English Text Society: *Lancelot of the Laik, a Scotch Metrical Romance* (1865); *Parallel Extracts from 29 MSS. of Piers the Plowman* (1866); *The Romans of Partenay or Lusignan, otherwise known as the Tale of Melusine* (1866); *Pierce the Ploughman's Crede* (1867); *The Vision of William concerning Piers the Plowman* (3 parts, 1867-73); *The Romance of William of Palerne, or William and the Werwolf* (1867); *The Lay of Havelok the Dane* (1868); *The Bruce, by Master John Barbour* (part i., 1870); *Joseph of Aramathie, or the Romance of the Saint Graal* (1871); and Chaucer's *Treatise on the Astrolabe*. For several of these he prepared introductions, notes, and glossarial indexes. For the Philological Society he edited a *Mæso-Gothic Glossary* (1868), for the Oxford University Press 2 vols. of *Specimens of English Literature* and several of Chaucer's *Canterbury Tales*, and completed for the Cambridge University Press the *variorum* edition of the *Anglo-Saxon Gospels* left unfinished by John Mitchell Kemble. In a new edition of Chatterton's *Poems* he settled the question of authenticity by showing the precise sources of Chatterton's diction; is author of a *Hand-list of some Cognate Words in English, Latin, and Greek* (1871); *Questions for Examination in English Literature* (1873); an *Etymological Dictionary of the English Language* (1882); *The Principles of English Etymology* (2 vols., 1887-91); an edition of *Chaucer's Minor Poems* (1888); and *Complete Works of Geoffrey Chaucer* (6 vols., 1894).

Revised by BENJ. IDE WHEELER.

**Skeleton** [= Mod. Lat., from Gr. σκελετόν (sc. σῶμα, body), dried body, mummy, skeleton, liter., neut. of σκελετός, parched, dried up, deriv. of σκέλλειν, dry, parch]: in its broadest sense, the structures serving to support and protect the more delicate tissues of the body of an animal. Among the invertebrates the skeleton is often represented by calcareous or siliceous plates or masses developed in connection with the integument, hence known as the exoskeleton, as distinguished from the more highly specialized supporting apparatus developed within the connective tissue as the cartilage or the true osseous substance which constitutes the endoskeleton. Ignoring the feeble attempts at the formation of a connective-tissue skeleton which are found among the lower animals, as the *Vermes* and the *Mollusca*, a true skeleton, composed of cartilaginous or osseous pieces forming a definite framework throughout the body, may be said not to exist except in vertebrate animals.

In addition to the endoskeleton, many vertebrates also possess in connection with the integument supplementary protecting structures which constitute an exoskeleton. Conspicuous examples of such structures are seen in the external skeletal plates of the sturgeon, the tortoise, or the armadillo. In other animals, again, a partial bony support is formed within the substance of certain organs, as, for example, the bony plates within the heart-walls of ruminants, the osseous rods within the tongue of certain lizards, or the slender bone within the male copulative organ of many carnivora, rodents, bats, and some monkeys. Such osseous structures occurring within the substance of the viscera constitute the splanchno-skeleton.

The first framework formed within the immature animal is the primary cartilaginous skeleton which is developed by the specialization of parts of the connective tissue of the embryo. This framework of cartilage in a general way outlines the bony skeleton, although much simpler than the latter in its details. Among the higher vertebrates the cartilaginous structures are only temporary, and after affording support to the delicate softer tissues of the developing organs for a limited time are replaced by the permanent bony skeleton. While such substitution is almost complete among the higher animals, some of the lower vertebrates, as the sharks, retain the primary cartilaginous framework throughout life as their permanent skeleton. Usually, however, after a time, at certain points called centers of ossification, the cartilage becomes invaded by true bone-producing tissue, and the substitution of osseous for cartilaginous structures is effected. For the details of the process of bone-formation, see the article HISTOLOGY.

Every vertebrate, whether fish, amphibian, reptile, bird, or mammal, possesses in the spine or vertebral column a fundamental axis in regard to which the remaining portions of the endoskeleton are symmetrically arranged. This axis is not necessarily bony in character, since in some fishes it never develops beyond the cartilaginous condition. In the lancelet, or amphioxus, it never attains even to the cartilaginous stage, but represents the primitive embryonic axis, the notochord. See EMBRYOLOGY.

The vertebrate axis is formed by a series of disks, the bodies of the vertebrae extending from the base of the skull to the caudal pole and including a variable number of segments, as few as fifteen or as many as 365. From this fundamental axis two series of very unequal dorsal and ventral arches extend. The dorsal arches are formed by the union of short vertebral plates—the laminae—which thus form a tube extending from the cephalic to the caudal pole of the animal. This tube is the vertebral canal and contains the spinal cord. At its anterior, or cephalic extremity, the tube usually widely expands into the cranial cavity containing the brain. The brain-case, or cranial portion of the skull, may be considered in a qualified sense as being composed of enlarged and modified vertebral segments. The dorsal or vertebral canal is distinguished therefore as containing and protecting the great cerebro-spinal nervous axis.

The ventral arches proceeding from the vertebral axis, on the other hand, are less constant, varying greatly in their number and position. The ventral arches are principally represented by the ribs, thoracic or abdominal, and by the variable series of branchial bows, or gill-arches, placed at the base of the head. The ventral arches inclose the thoracic and abdominal organs, affording them protection and support.

The osseous framework of man, in common with that of other high vertebrates, consists of two parts—the axial and the appendicular skeleton. The former includes the more constant and essential portions of the vertebrate framework, namely, the vertebral column, the skull and the ribs, with the breast-bone. The appendicular skeleton depends for its development upon the presence of limbs, since it includes the bones of the extremities, together with those forming the skeletal connection between the framework of the limbs and the spine. These connections are known respectively as the shoulder-girdle and pelvic girdle.

The shoulder-girdle in man consists of the collar-bone or clavicle, and the shoulder-blade or scapula, by means of which the bones of the upper limb are indirectly connected to the axial skeleton, an arrangement favoring the great latitude of motion enjoyed by the upper extremities. The pelvic girdle is much more fixed, consisting of the hip-bones or innominate, which give firm support to the thigh-bones and transmit the weight of the upper portions of the body. In animals, as the whales, where the hind limbs are wanting, the pelvic girdle, and hence the pelvis, is absent.

ble, which is much longer than the upper and compressed like a knife-blade, cutting through the water. They are related to the terns, but belong to a distinct family. The black skimmer (*R. nigra*) is black above, white below. The spread of wing is 3½ to 4 feet; length, 16 to 20 inches. It ranges northward to New Jersey, but *R. albicollis* is Indian and *R. flavirostris* African.

F. A. L.

**Skin:** See HISTOLOGY.

**Skin Diseases:** diseases affecting the skin. These diseases appear as primary or secondary eruptions. The following are the primary forms: (1) The *macule* or *spot*, a change of the normal color of the skin without elevation, arises from hyperæmia, hæmorrhage, or inflammation, sometimes from anomalies of the distribution of the coloring granules of the skin. (2) The *papule* or *pimple*, a projection above the surface, varying in size from that of a millet-seed to that of a lentil, is produced by diseases of the cutaneous glands, inflammation, and new growths of the papillary layer. (3) The *tubercle* is a solid projection of the size of a lentil up to that of a hazel-nut. (4) The *wheel* is slightly raised above the surface, and greatly exceeds the thickness in horizontal extension, varying in size from that of a finger-nail to that of the palm of the hand. (5) The *tumor* forms a solid projection of the size of a walnut to that of a man's fist. (6) *Vesicles* are elevations of the epithelial layer of the skin produced by a transparent or milky fluid, corresponding in size to that of papules, and as such never being of a long duration; while (7) *blebs* surpass the size of vesicles up to that of a goose's egg, and (8) *pustules* always contain pus, and therefore form superficial abscesses of the skin. Vesicles, blebs, and pustules almost always are surrounded by inflammatory areas.

Secondary forms of eruptions are (1) the *excoriation*, a flat abrasion of the epithelial layer of the skin, arising from destruction and rupture of primary eruptions, very often through scratching with the finger-nails. They always heal without the formation of a scar. (2) The *ulcer* presents a loss of substance penetrating into the derma, which heals slowly and with formation of a cicatrix. (3) *Fissures* are elongated cracks in the skin on parts liable to much stretching. (4) *Scales* are produced by detached epidermis. (5) *Crusts* result from drying of an exuded fluid or of extravasated blood. (6) *Scars* or *cicatrices* are connective-tissue formations which replace deeper losses of substance of the derma.

The causes of diseases of the skin are either rooted in the whole organism, or they are local ones, by which the skin is primarily or chiefly attacked; hence the division into symptomatic and idiopathic affections of the skin. Certain rashes occur in variola, scarlet fever, measles, syphilis, in typhoid fever, in purulent infection of the blood, so-called pyæmia, in scrofulosis, scorbutus, etc. Moreover, diseases of internal organs may involve the skin, especially affections of the intestinal tract, of the liver and spleen, of the internal genital organs, of the urinary apparatus, of the nerve-centers. There are, lastly, normal processes—dentition, menstruation, pregnancy—which lead to various kinds of cutaneous affections. Besides general injurious influences—heat and cold, dryness and moisture, different arts and trades—merely local diseases are caused by the operation of caustic substances, neglect of cleanliness or exaggerated washing and rubbing with strong kinds of soap, long-continued pressure upon certain parts, and parasitic organisms which penetrate the skin. The scratching of the patient himself who suffers from itching is an important cause for producing mechanically lesions of the skin. Thus parasites give rise to such affections by irritating the skin directly or by exciting the sensibility of the cutaneous nerves by producing the sensation of itching.

The changes of the skin, by too great an afflux of blood (hyperæmia) or lack of blood (anæmia), as such do not produce diseases of their own, being always of a transient character or rooted in diseases of the whole organism, and are therefore omitted in the following enumeration.

1. *Diseases due to Perverted States of the Secretions of the Cutaneous Glands.*—The sweat-glands of the skin (see HISTOLOGY) produce a fluid, the perspiration, which contains 99.3–99.5 per cent. of water, the residue consisting of solid matters, among which are chloride of sodium, phosphate of lime, hydrochlorate of ammonia, and traces of iron and of fatty matters. Even in the normal state each individual diffuses a special odor. There are persons with a peculiar rancid odor of their perspiration, a disease called *bromidrosis*, either universal or local—for instance, lasting in the

armpits, on the feet—in spite of the most scrupulous cleanliness. This disease is always dependent on too copious perspiration (*hyperidrosis*), and curable by repeated treatment with diachylon ointment. The secretion of a colored perspiration is termed *chromidrosis*. The sebaceous glands, which secrete a fatty mass, may produce the sebum in excessive quantity, there being no impediment to its secretion—the so-called *seborrhœa*. The disease is very common on the scalp (dandruff), and always leads to loss of the hair. It yields readily to certain preparations of tar, and a new growth of hair can very often be obtained. If, on the contrary, the excretion of the sebaceous mass be interfered with, the result is its accumulation within the glands or their ducts, the so-called flesh-worm—*comedones*. In the mass of a flesh-worm there is often found a mite, the *Acarus folliculorum*. The flesh-worms, again, are the most common causes of pimples, as they act upon their neighborhood like foreign bodies.

2. *Diseases due to Inflammation.*—Inflammatory affections of the skin may be acute or chronic. The acute contagious inflammations, so-called *exanthemata*, are due to diseases which attack the whole organism, are attended with febrile symptoms, present certain definite appearances on the surface of the body, and run a course the duration of which can be computed beforehand. In these diseases—*measles*, *scarlet fever*, and *smallpox*—the sympathy of the entire organism is manifested by symptoms of various kinds, both while the rash is present and also after its disappearance. The acute, non-contagious inflammations have a definite typical course, as their symptoms succeed one another in regular order. If the inflammation be manifested mainly by redness, with a slight exudation of the fluid part of the blood, fugitive rashes are produced, which, when spread over large parts of the surface are termed *erythema*, but when presenting isolated red spots are termed *roseola*. Extended and isolated superficial inflammations, accompanied with stinging or itching sensation, receive the name of *urticaria*, the latter being always characterized by the development of wheals. Diseases of this kind often are produced by disturbances of the stomach or by local irritations of the skin. They usually disappear after a short time without special treatment, but are very liable to recurrences. Lastly, there exist acute inflammations with accumulation of fluid beneath the epidermis, leading to the formation of vesicles and blebs, with short duration and no liability to return. The *herpes zoster* (shingles) is the most important of the forms of *HERPES* (q. v.). Shingles attack the individual, in most instances, only once during life. The chronic inflammations, such as *psoriasis*, *lichen* (qq. v.), and *pityriasis rubra*, are characterized by a tendency to repeated relapses and the protracted course which they run. *Psoriasis* is a very common disease, characterized by white, rough patches on a dark-red ground, dispersed all over the body, mainly on the elbow and knee. The patches are not liable to any further change, such as supuration and ulceration; they leave no scars, though they are sometimes followed by persistent pigmentation. Sensations of pricking or itching are complained of only when the patches first come out; afterward there are no subjective symptoms. The disease occurs often on otherwise healthy and strong individuals.

A second group of inflammatory affections is characterized by intense itching, and besides the primary form of eruption they irresistibly provoke scratching in consequence of the itching; this, again, gives rise to further changes in the skin known as excoriations. To this group belong *ECZEMA* (q. v.) and *prurigo*.

A third group of chronic inflammatory diseases embraces those pimply and pustular affections which arise from inflammation of the hair-sacs and sebaceous glands. They include *acne*, *sycosis*, and *rosacea*. *Acne* on the face, the chest, and the back—one of the most disfiguring diseases—is always produced by accumulation of sebaceous masses in the glands (flesh-worms), and is entirely curable by repeated emptying of the glands.

To the fourth group of chronic inflammations belong the eruptions in shape of blebs, termed *PEMPHIGUS* (q. v.). Chronic inflammations of the skin of very variable but characteristic forms are produced by a general disease, *syphilis*; here the skin is merely symptomatically attacked, besides different other organs. With traumatic lesions of the skin, as well as with its inflammatory diseases, hæmorrhage is very often combined. Hæmorrhage is furthermore a symptom of universal disease in *scorbutus* and in *purpura rheumatica*. See *PURPURA*.

4. *Thrombosis due to Hypertrophy*.—The excessive production of connective tissue of the skin may be a consequence of a chronic inflammatory process, or it may occur without the symptoms of inflammation as a consequence of abnormal constitutional productivity. The same and the reason for hypertrophy are connected with a long-continued local irritation of the skin, but evidence is known in which typhoid, the hardening and hypertrophy of the skin at the palms and the soles, may be considered as a congenital disease. The first cause is a chronic hypertrophy of all constituting tissues of the skin, it doubtless due to chronic inflammation of the lymphatics; while hypertrophy of the connective growth of epidermis, is due to the congenital hypertrophy of the papillae. Warts and papillary growths of the skin may be produced by either kind—local irritation as well as anomalous function of papillae. Heredity of the skin, hypertrophy of the nails and the hair—*polymatousness*—are dependent on congenital anomalies in the formation of the tissues of the skin. The permanent hypertrophy of the skin impressing are very often hypertrophied, leading to formation of brown spots *ephelides* (freckles), *adenomas*, skin-cysts, while long-continued irritation of the skin leads to universal dark discoloration—*melasma*.

5. *Thrombosis due to atrophy* are based on the same principles as hypertrophy. Inflammation often produces first hypertrophy, afterward atrophy, loss of substance, and atrophy. Hypertrophy of the pigmentation is not rarely combined with the partial atrophy of *vitiligo*, *leukoderma*, etc. Atrophy of atrophy are due the same changes of the skin, the white coat of the hair, the early falling out of the hair without inflammation, the localized atrophy of hairs in *alopecia areata*, (see *Reactions*). A plain atrophy is also the *leukoderma*. Very little can be done with regard to the cure of these diseases.

6. *Thrombosis in New Growth*.—New growths or tumors of the skin belong to the mesodermatous formations of the skin, the tumors are products of an anomalous epithelial growth. Tumors of the former kind may be benign or malignant, the polypoid and ulcerating, not recurring after excision, and not infecting the organism, such as *fibroma*, a variety of which is the formation of warts without pressure, the *fibroma*, the *melanotic fibroma*, furthermore, *papilloma*, growth of the papillary layer, embracing most of the *actinoma* and *basoma*, locally, *angiosarcoma*, epithelial tumors produced by rupture and formation of blood-vessels. Of the sarcomatous tumors are malignant, viz., painful, ulcerating, producing new growths around the first-formed tumor, and finally causing after excision, even leading to metastasis formation of identical tumors in the lungs, liver, etc., most are occurring, one variety of which the *pigmented* or *melanotic* sarcoma, forms the most malignant kind of tumors of the organism. Cancer is considered to be essentially an *infectious* formation, which always is malignant. In all tumors the medical expectation is the only reliable means of curing the disease, very often of saving the life of the patient.

7. *Thrombosis due to Anomalous of Infection*.—*Neurodermatitis*.—Many of the already named diseases of the skin can be looked upon as being disturbances of the nerves in the first instance. *Neurodermatitis*, *herpes zoster*, *leprosy*, *atrophy of pigment*. Disturbances in the property of sensation of the skin, *leprosy*, *neurodermatitis*, *neurodermatitis*, and related sensory *hyperesthesia*. To the latter kind belongs the itching of *eczema*, *pruritus*, *neurodermatitis*.

8. *Thrombosis due to Parasites*.—The *Scabies* (q. v.) is produced by the presence of the *Malassezia* within the epidermis. The disease is readily cured by local application of caustic potash solution. Analogous is the action of the flea, the bed bug, and the house. If verminous parasites are present, slightly scaling and itching brown spots,  *pityriasis versicolor*. Furthermore, *herpes zoster* (ringworm), a very common disease, appearing first in the shape of small vesicles, crusts, and eruptions, which, when situated on the parts covered with hairs, lead to baldness; lastly, *Pruritus* (q. v.), a disease caused by ringworm. If the parasites are killed, a perfect cure can be obtained; but on the scalp and the beard, where the parasites advance deeply into the roots of the hairs, these diseases usually are very obstinate.

Revised by G. H. Fox.

**Skink** any one of the lizards of the family *Scincidae* (q. v.).

**Skittagestan** lizards of the family *Dermapidae*, which are black above and are often very distinctive in coloration. The most notable species are the *Dermaptes lardarius*, (2)

*Dermaptes vulpinus* and the *Anthrenus nemorosus*. The first is the most pestilential with a broad brownish-grey band on the sides, relieved by three black spots on each side. Both the tongue and the legs are very distinctive. The second is mostly black above, but the sides of the thorax and the under part of the body are covered with white scales. It is less common and less generally distributed than the preceding, but almost equally to be dreaded. Both the preceding attack about a quarter of an inch in length. The third species has often been seen in great numbers on the elms. It is often very destructive to numerous plants, and especially to collections of pressed flowers. It has become a household pest, and is known as *beetle-rot* or *beetle-rot*. It is only about a tenth of an inch in length. All these species may be killed by applications of benzene, and this remedy is perhaps the most effective, although sulphur and turpentine are also used. Specimens for medicinal should be prepared for resistance to the attacks of these insects by applications of arsenic, sulphuric acid, creosote, salicylate, and benzene.

R. A. Howe.

**Skinner, John Stuart**, editor; b. in Maryland, Feb. 12, 1788; was admitted to the bar 1810; settled at Baltimore 1811; was postmaster of that city 1812-17; began in 1810 the publication of *The American Farmer*, the first periodical exclusively devoted to agriculture in the U. S.; afterward edited several other periodicals of similar character, including *The Fair Register* and *The Plough, Loom, and Anvil*; was the first organizer of agricultural shows and fairs in the Middle and Southern States; wrote several works on farming and spinning topics, and was third assistant postmaster general 1844-46. D. in Baltimore, Mar. 21, 1851.

**Skinner, Thomas, M.D.**, ethnologist; b. in London, England, in 1829; graduated at Christ Church, Oxford, 1851; studied philology and medicine on the Continent, especially at Heidelberg; became a physician at London; was at various student of many languages, and devoted his life to the preparation of a vast work on English etymology, which he left incomplete at his death, which occurred at London, Sept. 5, 1885. Fortunately his MSS. fell into the hands of Thomas Henshaw, who revised them under the title *Etymologicon Linguae Anglicanae* (London, 1886, 1871), a work of great value to the critical student of English.

**Skijack**: any one of several fishes having a tendency to leap from the water, as the Roanoke (q. v.), the Drumstick (q. v.), the Sable (q. v.), and a fresh-water herring, *Clupea chrysocentrus*.

**Skipper**: (1) the Sable (q. v.); (2) any one of several small dark-colored butterflies of the family *Hesperidae*.

**Skirret**: the *Sium asiaticum*, an umbelliferous parsley-like plant, a native of Asia long cultivated in Europe, and rarely in the U. S., for its root, which is very nutritious and palatable. Skirret affords a good percentage of alcohol when distilled, owing to the large amount of sugar present.

**Skittagestan Indians** (*Skittagestan* derived from Skittage, the name of a chief, and was first employed by Halbert in 1848); a linguistic family, also well known as the *Halba*. They are in two divisions, the *Halba proper* and the *Kangani*. The former are confined to the Queen Charlotte Islands, Northwestern America; the *Kangani*, who form an offshoot of the *Halba proper*, emigrated to Forrester and Prince of Wales islands, probably since 1790. In the *Halba* division there are thirteen villages, besides others that have been abandoned, and in the *Kangani* division there are seven occupied villages and three abandoned ones. Five other villages, which can not be identified with any of the preceding ones, were named by Krauss in 1885.

**General Characteristics**.—Investigations into the native languages by Dr. Franz Boas render it quite probable that the family should be merged into the neighboring *Kalmuk* family. (See *Kalmuk* INDIANS.) They are large, better proportioned, and of lighter complexion than the *Salish* and other southern coast tribes. The *Halba* are essentially maritime Indians, and derive their subsistence from the rivers and sea. Shellfish are much used, as are all sorts of roots and berries. The first rudiments of agriculture are discernible among them in the cultivation, from a remote period of tobacco, either the true plant or one of the several substitutes employed. The dog was their only domesticated animal. The *Halba* live in permanent villages, but they scatter more or less at different seasons in pursuit of food. The houses, which are the large structures common to the northwest coast, are occupied continually, several

related families dwelling under one roof, the household being governed by an elder or sub-chief. There is nothing in the nature of a confederacy of the several villages. The chieftaincy was hereditary, and, as descent was through the female line, it passed, on the death of a chief, to his eldest brother, or, there being no brother, to his sister's son. Customs came to have the force of laws, and persons were restrained from injury to the person or property of a fellow tribesman by the custom of reprisals. In some respects, apparently, the tribes of the northwest coast, especially the Haida, had advanced beyond the condition of the eastern Indians, as partially shown by the extent to which they possessed personal property, and by the establishment of personal ownership in land. The Haida appear to have been of martial character, internal warfare having been common, as also forays upon distant tribes for the purpose of procuring slaves. The institution of hereditary slavery seems to have been intimately woven into the social system of the Haida, and slaves were regular objects of barter. The Haida are skillful workers in wood, and to some extent in metal, particularly copper. Their great skill at carving is seen, perhaps at its best, in the well-known carved totem-posts which adorn each village. Tattooing was formerly universal; labrets were worn by the females. The institution of the potlatch—the free distribution of property on certain ceremonial occasions—exists among the Haida, as among all the tribes of the northwest.

**Population.**—Dawson estimates the present number of the Haida to be from 1,700 to 2,000; Petroff gives the number of the Kaigani as 788. These figures indicate a marked decrease of population since 1850.

**AUTHORITIES.**—H. H. Bancroft, *Native Races* (1882), iii., 564, 604; J. C. E. Buschmann, *Spuren der aztek. Sprache* (1859), 673; Dawson, *Queen Charlotte Islands* (1880); A. Gallatin, in Schoolcraft's *Indian Tribes* (1853), iii., 402; Krause, *Thinkit Indianer* (1885), 304; L. H. Morgan, *Ancient Society* (1878), 176; I. Petroff, Tenth Census, Alaska (1884), 32; Poole, *Queen Charlotte Islands* (1872), 195, 309; H. R. JAMES OWEN DORSEY.

**Skittles:** See **BOWLS** and **BOWLING**.

**Sko'beleff**, MICHAEL DMITRIEVITCH: Russian general; b. in 1841; served in the army against the Polish insurrection in 1863; was called to join the general staff in 1866; and in 1869 was sent to Turkestan, where he secured much valuable geographical information, which he afterward employed to great advantage in the expedition against Khiva in 1873. In this expedition he won great distinction. He afterward crushed the rebellion in Khokand, and became governor of the territory he had subdued. In the Russo-Turkish war he showed a degree of valor and skill in marked contrast to the inefficiency at the Russian military headquarters. He commanded the left wing at Plevna, captured the so-called Shipka army, Jan. 9, 1878, and took Adrianople. D. suddenly in Moscow, July 7, 1882. See Ossipovitch, *Michael Dmitrievitch Skobelev* (Hanover, 1887).

**Skoke:** See **GARGET-ROOT**.

**Skowhegan:** town; capital of Somerset co., Me.; on the Kennebec river, and the Maine Central Railroad; 35 miles N. by E. of Augusta, and 50 miles W. of Bangor (for location, see map of Maine, ref. 6-C). It derives excellent water-power from the river, which has here a perpendicular fall of about 30 feet, and has manufactories of woolen goods, scythes and edged tools, shoes, oilcloth, pulp, lumber, and flour. There are electric-light and power plants, water-works, 7 churches, free public library (founded in 1867), 2 national banks with combined capital of \$275,000, a savings-bank, and 2 weekly newspapers. The town was originally known as Canaan; was incorporated under the name of Milburn in 1823; has been called Skowhegan since 1836. It was enlarged by the annexation of the town of Bloomfield in 1861. Pop. (1880) 3,869; (1890) 5,068.

J. O. SMITH, EDITOR OF "SOMERSET REPORTER."

**Skua, or Skua-gull:** See **JAEGER**.

**Skull** [M. Eng. *skulle*, loan-word from Scand.; cf. Icel. *skál*, bowl; Germ. *schale*; cf. *hirschschale*. Eng. *scale* (of balance) is a doublet, of native origin]: the hard framework of the head of vertebrates. It consists of two portions, the cranium which forms the protecting case for the brain, and the facial structures. These may all consist of cartilage throughout life, as in the sharks, or entirely of bone, as in

adult birds and mammals, or of both bone and cartilage, as in many fishes and amphibians. In the lower forms no separate cranial elements can be recognized, the brain-case forming a continuous structure, with openings here and there for the passage of nerves, blood-vessels, etc. In the higher vertebrates distinct elements or bones can be recognized in the cranium, and these arise either by ossification of the cranial cartilage or by the formation of bone in the membranes outside the cartilage cranium. A similar distinction can be drawn between the cartilage-bones and the membrane-bones of the face. For the details of the bones of the skull, reference should be made to works upon comparative anatomy. The following are the bones more frequently found in the skull, arranged according to their origin and position:

**Cranium.**

**Cartilage-bones:**

Floor. Basisphenoid, basisphenoid, presphenoid.

Sides. Exoccipital, bones of the ear-capsule (otic), orbitosphenoid, alisphenoid.

Roof. Supraoccipital (part).

Front. Mesethmoid, lamina cribrosa.

**Membrane-bones:**

Floor. Parasphenoid.

Sides. Temporal or squamosal, parietal, supra- and post-orbital.

Roof. Supraoccipital (part), frontal, pre- and post-frontal.

**Face.**

**Cartilage-bones:** Palatine, pterygoid, quadrate, and articular.

**Membrane-bones:** Premaxillar, maxillar, vomer, nasal, lachrymal, jugal, and quadratojugal, and in the lower jaw the dentary, splenial, and angular.

It is rarely that all these bones are present in one and the same form. Usually there is an over-development (hypertrophy) of one and an under-development (atrophy) of its neighbors, or a fusion of two or more may occur. Still other bones may exceptionally appear (e.g. in the suspensory apparatus of fishes), which are properly not to be regarded as belonging to the skull. Although the subject of an enormous amount of study, the skull is yet far from thoroughly known. The best general account will be found in Parker and Bettany's *Morphology of the Skull* (London, 1877).

In the human skull but twenty-two bones exist, eight in the cranium and fourteen in the face. This is largely due to the fusion of bones distinct in the embryo as well as in the adult of lower forms.

J. S. KINGSLEY.

**Skull-cap** [so called from the helmet-like appendage to the upper lip of the calyx]: any one of a genus (*Scutellaria*) of perennial herbs found over a wide range of climates in America, especially in Mexico and the sub-tropical regions, though several species grow in northern parts of the U. S. and in Europe. They derive their name from an envelope around the fruiting calyx, have little aroma, and—especially for the cure of hydrophobia—enjoy a popular reputation which is entirely undeserved.

**Skunk** [from Abenaki (Amer.-Ind.) *sekan'ku*, skunk]: a musteloid carnivorous mammal of the sub-family *Mephitinae*. The body is moderately elongated and arched backward; the legs comparatively short; the feet sub-plantigrade; the tail rather long and very bushy; the color is particolored, black and white being contrasted. Their anal glands, according to Chatin, are essentially like those of the badgers and rats, and are in a single pair and of large dimensions; their outer walls are formed by a thick fleshy tunic formed of two layers of interlaced fibers, capable of sudden strong compression of the receptacles; these are enormous reservoirs, with a dense resisting fibrous coat, always containing a considerable quantity of the follicular product. The glandular substance is not spread all over the central pouch, but is restricted to a particular portion, and contrasts by its dark color with the white ground of the envelope of the pouch. The receptacles contain a nauseous liquid, which the animal, on being alarmed, discharges with such force that the jet is carried to a distance of from 8 to 12 feet. The voiding of the liquid must be sudden; and it does not suffice that the receptacle is large and powerfully muscular; the offensive liquid must be directed far backward, so as to flow as little as possible upon the rectal muscular membrane; so the opening is large and upon the summit of an umbilicated papilla, around

City (for location, see map of Missouri, ref. 3-F). It is in an agricultural region, and contains 2 State banks with combined capital of \$150,000, a public high school, and a daily and 3 weekly newspapers. Pop. (1880) 771; (1890) 2,770.

**Slater, SAMUEL:** manufacturer; b. at Belper, Derbyshire, England, June 9, 1768; was apprenticed at the age of fourteen to Jedidiah Strutt, partner of Arkwright in the business of cotton-spinning; saw in a newspaper in 1789 the law passed by the U. S. Congress in that year for the encouragement of manufactures, and a notice of the bounty offered by the Pennsylvania Legislature for the introduction of the Arkwright patents into the U. S., the communication of the models of the new machinery to foreign countries being then forbidden by English law under severe penalties. Believing himself able to construct new machinery from memory, he sailed for New York. He entered into a contract with William Almy and Smith Brown, of Pawtucket, R. I., to construct and work the new cotton-spinning machinery, and started at Pawtucket, Dec. 21, 1790, a mill with three carding-machines and seventy-two spindles, which was the virtual beginning of the manufacture of cotton in the U. S. He erected cotton-mills at Oxford (now Webster), Mass., in 1812, to which he added woolen-mills 1815-16, the nucleus of the village of Slatersville. D. at Webster, Mass., Apr. 21, 1835. See Rev. George S. White's *Memoir of Samuel Slater* (Philadelphia, 1836; 2d ed. 1846).—His nephew, JOHN FOX SLATER (1815-84), became a manufacturer, and in 1882 gave \$1,000,000 for the education of freedmen in the South.

**Slatington:** borough (incorporated in 1864); Lehigh co., Pa.; on the Lehigh river, and the Lehigh Val. and the Phila. and Reading railways; 16 miles N. W. of Allentown, the county-seat (for location, see map of Pennsylvania, ref. 5-1). It has 9 churches, 14 public schools, including a high school with college preparatory department, extensive slate-quarries, rolling-mills, steam-boiler works, large school-furniture factory, a national bank with capital of \$100,000, and a weekly newspaper. Pop. (1880) 1,634; (1890) 2,716; (1895) estimated, 3,500. EDITOR OF "NEWS."

**Slave Coast:** old geographical name for that part of the coast of Upper Guinea which is about the Bight of Benin, so named because formerly a favorable place for obtaining slaves. It is now in part Dahomey, under French protection, and in part (to the E.) the territory of the Royal Niger Company. See DAHOMEY and NIGER TERRITORIES.

**Slave Lake and River:** See GREAT SLAVE LAKE.

**Slavery** [deriv. of *slave*, of like source with Germ. *sklave* < M. H. Germ. *sklave*, *slave*, Dutch *slaaf*, Fr. *esclave*, originally a Slave, a Slavonian. The word acquired its meaning in Italy in the eighth or ninth century]: a state of bondage in which one human being is in complete subjection to the will of another. In its usual sense it is restricted to chattel slavery, in which the slave may be bought and sold like ordinary property, and it thus excludes the milder forms of bondage, such as serfdom or villanage. In its origin it was the sign of advancing civilization, in that it arose from the practice of sparing the lives of captives, who in the period of primitive savagery were generally slain by their captors. The arts of production must have reached the point at which a man's labor produced a surplus over what was necessary for his own support, for among barbarians clemency toward captives sprang from the perception that an economic benefit might be gained by their enslavement. The slavery of the industrial classes has characterized the early history of all civilized races, and as forcing men to labor, despite the natural reluctance inherent in barbarous tribes, seems to have been a necessary element of progress. It existed among all the races of antiquity of whom there is historic record, but in some its rigors were mitigated by peculiar laws and customs, as among the Hebrews, whose slaves became free after seven years had elapsed from the beginning of their servitude, while every fiftieth year, on the occasion of the jubilee, all slaves were emancipated.

**Greek Slavery.**—The Homeric poems bear witness to the antiquity of the practice of holding slaves among the Greeks. In the historic period the supply seems to have been kept up by capture in war, and by purchase from the slave-owners of Asia Minor and Thrace. Kidnapping, the sale of children by their parents, and enslavement for debt were also sources of supply. The rearing of slaves was never an abundant source in Greece, as it was cheaper to purchase those who had already reached the age of labor. They were employed in domestic service, in agriculture, and even in

commerce, manufactures, and occupations in which the risk and responsibility were great. As to the relative numbers of the slaves in Greece reliable statistics are lacking, but it is probable that in the cities they were greatly in excess of the free population. It is estimated that in Attica the slaves bore to the free native population the ratio of three to one, and in Sparta the Helots are said to have numbered 220,000, while the Spartans numbered only 32,000. Their treatment differed greatly in the different cities. In Sparta the Helots suffered cruel treatment at the hands of their masters, despite their kinship of race, while the Athenian masters were noted for their mildness. By the Athenian law a slave who had just grounds for complaint against his master could demand to be sold; he had a right to asylum in the temples and sacred places, and his death could be avenged like that of a free citizen. He could purchase his freedom with the money that he had saved during servitude, and could be liberated by the act of his master. As a reward for fidelity or honorable services emancipation was frequent. No consciousness of the injurious moral effects of slavery seems to have been felt by the greatest thinkers of classic Greece. Aristotle and Plato both regarded the institution as necessary, the former holding it to be beneficial to both parties if practiced with justice.

**Roman Slavery.**—In Rome slavery became more highly developed, and formed a more essential part of the social and political system than in any other ancient state. As in Greece, the sources of supply were wars and commerce with the slave-producing countries of the East, the latter being by far the more important source in the latter years of the republic and under the empire. The proportion of slave to free population is estimated by Blair at three to one in the period from the middle of the second century B. C. to the reign of Alexander Severus (222-285 A. D.), and the number of slaves owned by a single master was often very large. A freedman in the reign of Augustus is said to have left by his will over 4,000, and families of 200 or 300 slaves were not uncommon. As to the legal status of the slave, he was under the complete dominion of his master, against whom he had no legal redress. The marriage of slaves had no legal recognition, and their union (*contubernium*) was terminable at the will of the master; nor could a slave legally acquire property, though it became customary to permit him to enjoy a share of his earnings, known as his *peculium*. In general, punishments for crime were more severe against slaves than against free men. Their harsh treatment is attested by several servile insurrections, of which the most formidable were that of Eunus in Sicily in 133 B. C. and that of Spartacus in 73 B. C. By the second century, however, when the period of conquest had closed and the policy of the state aimed at peaceful development within existing limits, a greater humanity began to display itself in dealing with the slaves. This was furthered by the spread of Christianity, which, though it did not expressly forbid slavery or brand it as a crime, rested upon premises which must lead inevitably to its destruction. Accordingly, when the Teuton invaders settled within the Roman empire, they found the condition of slavery greatly modified. A system of caste or heredity in occupation had developed in both private and public business. The *coloni* on the landed estates were personally free, but could not leave the lands of the proprietors, and the prædial slaves in the course of time approached the condition of the *coloni*. Upon contact with the Roman civilization the Germanic tribes were naturally affected by the system of agricultural labor which they found in operation. Almost the only form of slavery known among them had been the slavery of the cultivator of the soil, and this gradually conformed to the condition of the Roman agricultural laborer. The resulting system was serfdom (see SERF), the effect of which was to lower somewhat the position of the old *colonus* while it raised that of the class of agricultural laborers as a whole.

**Mohammedan Slavery.**—During the Middle Ages slavery was still practiced, but among Christian races the enslavement of Christians was opposed by the Church. No such scruple applied to the enslavement of Mohammedan captives, many of whom were held as slaves throughout Europe, while numerous Christian slaves were left in the hands of the Turks and Saracens in the course of the many conflicts between Christianity and Mohammedanism. Many Moslem slaves were introduced into Europe by the great commercial cities of Italy, which carried on an extensive slave-trade with the East. On the other hand, the corsairs of Barbary carried off thousands of Christians into slavery, even pen-

(3, 4, 5) The development of the country—Central Africa—by roads, railways, steamboat service supported by fortified posts, and telegraph lines to unite them.

(6) The organization of expeditions and flying columns to protect the communications and "support repressive action."

(7) The restriction of the importation of modern firearms and ammunition throughout the entire region in which the slave-trade is carried on.

This is a most attractive programme, if it can be carried out. Without good weapons the Arabs and their slave-hunting auxiliaries would not venture to attack the native tribes. Armed boats on the great lakes and fortified stations on the great highways would break the trade up effectively, while the growth of missions, of civilization, and of civilized trade would narrow its operations. To the carrying out of this programme the signatories pledged themselves with much detail and many provisions. At sea also, along certain stretches of coast, on the Indian Ocean and off Madagascar, the powers agreed to combine to put down slave-trading in small vessels.

Finally, those of the signatory powers whose domestic institutions recognized slavery agreed to forbid the importation of slaves, their transit, their departure, and the trade in them; while Zanzibar, Persia, and Turkey have bound themselves to assist actively in the suppression of this traffic. The provisions of the act to secure all these objects run through 100 articles.

THEODORE S. WOOLSEY.

**Slavic Languages:** a group of Indo-European languages which embraces Russian, Polish, Servian, etc. 1. Whether there ever was a unitary Slavic language is still a problem of philology. Theoretically, it is proper to speak, within the field of the Indo-European languages, of a unitary Slavic type, intimately related to the Baltic; and these two are often grouped as a Lithu-Slavic or Balto-Slavic branch of Indo-European, just as Sanskrit and Iranian are comprehended under Indo-Iranian. And the branch thus constituted undoubtedly stands in many characteristic phenomena nearer to the Indo-Iranian than to the Germanic, Celtic, Italic, or Greek. The Balts (i. e. the Lithuanians, Letts, and Prussians) have in common with the Slavs as against the remaining Indo-Europeans a richly developed vocabulary, similar formative suffixes, and noun and pronoun declensions closely related, especially in the formation of the so-called compound declension of the adjective with the pronoun stem *ja-*; e. g. *raū* *dydū* is in Lith. *gero-jo* (gen. of *geras*, good, and *jis*, he), in Slav. *dobra-jego*. In conjugation there are fewer points of contact, but the Lith. infin. in *-ti*, and the Slav. in *-ti* come close together: *dūti, dati*; likewise the supines in *-tum*: *tū*: *dūtum, datū*. In the consonant system Baltic shares with Slavic the loss of aspirates: Lat. *fero*, Gr. *φέρω*, Lith. *beriu*, Slav. *beru*; Lat. *fumus*, Gr. *θυμός*, Lith. (pl.) *dumai*, Slav. *dymū*; also the change of the palatal explosives to spirants somewhat as in Indo-Iranian: Gr. *ἑκατόν*, Lat. *centum*, Goth. *hunda-*, Lith. *szimtas* (*sz* = Slav. *š*), Slav. *sūto*; Lat. *hiems*, Gr. *χειμῶν*, Lith. *žiema*, Slav. *zima*; Gr. *γυνή*, Lat. *gyneco*, Lith. *žinoti*, Slav. *znati*. In syntax may be noted as common to both the use of the

genitive object in negative sentences, e. g. Lith. *nesa jis ne*  
neg. subj. cum. voc. autem cum. cognoscetis  
*reg nej pažysta jos; bel jis je pažystate*, Slav. *jako ne vidit*  
*jego ni znajetj jeho, vy že znajete* i. Here *jos* and *jego* are objects in the genitive.

2. The Slavic type differs from the Baltic in two marked peculiarities: (a) the change of diphthongs into monophthongs; (b) by the finely organized laws of palatalization, i. e. by the regular change of *k, g, ch* to *č, ž, š* before the palatal vowels *e, ē, i, ī*, and by the later change of *k, g, ch* to *c, z, s* before the vowels *ē, i* which result from *oi, ai*. Here follow illustrations of both these typical phenomena: (a) Lith. *ai* corresponds to Slav. *ē* (a long, broad sound); *baisus*, terrible; *bėsinū*, angry; *dailinti*, decorate; *dėlati*, carve; *mainyti*; *mėniti*, exchange; *raižyti*; *rėzati*, cut. Lith. *au* corresponds to Slav. *u* (orig. long); Lith. *ausis*: Slav. *ucho*, ear; *draugas*: *drugū*, friend; *jaunas*: *junū*, youth; *kaupas*: *kupū*, heap. Sometimes Lith. *au* corresponds to Slav. *y* (a deep guttural long *ū*); Lith. *au* is here plainly a resultant of *eu*; *krauti*: *kryti*, cover; *grauzti*: *grysti*, gnaw; *mauti*: *myti*, wipe; *raudoti*: *rydati*, moan. Lith. *ei* and *iē* correspond to Slav. *i*: *eiti*: *iti*, go; *mielas*: *milū*, dear; *teisus*: *tichū*, still; *pietūs* plur. dinner-time; *pišta* (from *pija*), food. (b) The Slavic palatalization may be illustrated by the following parallels: Lith. *keturi*: Slav. *četyre*, four; *kibiras*:

*šibirū*, jug; *kirvarpa*: worm-hole; *šrūt*, worm, cf. Lith. *kirmis*: Lat. *vermis* for *\*kvermis*; *geidauti*, yearn: *o-šidati*, wait for; *gerti*, *geriu*, drink: *žrėti* (for *žerti*), *-žrę*, devour; *sarginti*, nurse: *stražiti* (for *storžiti*), watch over; vocat. *nebage*: *nebože* (from *nebogū*, poor). While this form of palatalization shows itself in all the Slavic languages and dialects, and consequently is their common property, dating from the time of their linguistic unity, there has been developed in one of the Baltic languages, viz., the Lettic, after the time of the division into the three chief branches, Lithuanian, Lettic, and Prussian, a phenomenon analogous to the Slavic palatalization, so that a *c* and *dz* correspond to the Slavic *č* (from *k*) and *ž* (from *g*); e. g. Slav. (Serv.) *čitarū*, whole: Lett. *ceļi*, firm (Lith. *kietas*); Slav. *čirta*, mark: Lett. *cirtu*, cut, but Lith. *kertu*; Slav. *šrūt*: Lett. *cērma*, worm, but Lith. *kirmis*; Slav. *živū*: Lett. *dziwe*, vivus, but Lith. *gyvas*. With the primitive Slavic phenomena of palatalization belongs also the change *ch* (= Gr. *χ*) > *š*. The Slav. *ch* is, however, itself a product of *s*. Cf. Slav. *suchū*: Lith. *saušas*, to which the verbum causat. is Lith. *saušinti*: Slav. *sušiti*: Lith. *daušos* plur. air: Slav. *duchū*, but Lith. *daušinti*: Slav. *dušiti*.

A later palatalization, but one which nevertheless falls within the boundaries of the Slavic group, is the change of *k > c, g > dz* (*z*), *ch* (*s*) > *s* or *š*, which occurs in the special case where a guttural comes before an *ē* or *i*, resulting from original *ai, oi*. Cf. Goth. *haila*, which would be *\*kailas* in Lith. if it existed, and Slav. *čelū*, salvus; Lith. *kaina* (: Lat. *poena*) and Slav. *cěna*, price; Lith. *gailus*, sharp: Slav. *džělū*, violent. This appears prominently in suffixes and case-endings or verb inflexions; nom. plur. of *slogas*, roof. Lith. *slogai*: Slav. *stodzi* from *stogū*; dat. sing. Lith. *rankai* from *ranka*, hand: Slav. *račel* from *rakā*; imper.-optat. from *teka*, flow: *tici-ticēle*. The commonest appearance is in the Slav. suffixes *-ici, -ica, -ice, -ica*, which are used so widely as to give the impress of peculiarity to the entire body of the language. The corresponding Lith. suffixes show always *k*. Cf. Slav. *věnici*, garland: Lith. *vainikis*; Slav. *juncici*, steer: Lith. *jaunikis*.

3. Another strong characteristic of the Slavic as against the Baltic type is the uniform loss of final *-s*. And as final *-ū* (< I.-E. *-ō, -ū*) and *-i* (< I.-E. short *-i*) became silent at an early date, present Slavic word-forms often appear mutilated to the extent of the entire final syllable. Cf. Slav. *drugū* (now *drug*): Lith. *draugas* (usually *draugs*); Slav. *osilū* (now *osel, osiel, osal*): Lith. *asilas*; cf. also the casus obliqui, Slav. gen. sing. *nošti* (< *notji*): Lith. *nakties*, Slav. acc. sing. *noštj*: Lith. *naktį*. But as an offset to its poorer noun declension, Slavic has a fuller and clearer development of verb forms—a difference which constitutes one of the most difficult problems of philology. Cf. Lith. 3 pers. pres. *tekis*, 3 pers. *teka*: Slav. *tečeti, tečeti*, pl. *tekať*; Slav. aorist formation *tekū-tekomū, tēchū-tēchomū, tekočū-tekočomū* and imperf. *tečāchū-tečāchomū* (also *tečechū-tečechomū*): Lith. perf. *tekėjau* and habitual imperf. *tekėdavau*. Lith. opt. *tekētumbei* (: supine *tekētum + bei*) corresponds with change of category to Slav. condit. *tekū bi*. On the other hand, the Slavic language type lacks all except a few traces of the *s*-future: *tekēsū* must be expressed in Slav. either by the pres. *teka* (compounded with various prepositions to complete its meaning) or by the inf. *tekti* (= *teiji, teči, teči*, *teci*) with the vb. *chošq*, will, *imamī*, have, or *bađq*, become. This last-mentioned distinction between the two language types is closely connected with the fine distinctions of the Slavic verb as regards the aspects of time-duration, which are not developed to the same degree in Baltic. In contrast to the Slavic use of the opt. as impv., *tici-ticēle* (where *i* and *ē* are parallel to Gr. opt. endings *-ois, -aere*), Lithuanian has a new formation from the true infinitive stem with *-k*: *te-kėk, tekėkite*. A trace of the optative remains in *te-tekū*.

4. The separation of the Slavic from the Baltic must have been many centuries before our era. Many new acquisitions of sounds and vocabulary fall in the subsequent period of separation. The lexicographical material common to Slavic and Baltic shows no great or long-continued advance in culture from the primitive Indo-European period. The common Slavic vocabulary, on the contrary, is characterized by a great wealth of words important for the history of culture, and testifies to so long a period of common development and so rich and varied a community of life that the separation of the Slavs into various branches and peoples must be a comparatively very recent matter, and a result merely of local expansion. Especially worthy of notice is the borrowing of culture-words from the Teutonic, usually

reflected in the names given it. At the outset Dobrowsky recognized in it a southern dialect, which he called at first Old Servian, later Bulgaro-Servian or Macedonian. Kopitar advanced the hypothesis of a Pannonian-Carantanian origin, which Miklosich followed with slight modifications. From these two scholars comes the name Old Slovenian. Šafárik defended the Old Bulgarian hypothesis, more on historical than on linguistic grounds. The name Old Slovenian is still used because in native sources the language was so called, *slovénskú* (*slovenica lingua*), but it is now known to have been a South Slavic dialect spoken somewhere in Macedonia in the ninth century, having the most points of contact not with modern Slovenian, but with Bulgarian, and some also with the present Servo-Croatian dialects. In location it probably formed a frontier between Bulgarian and Servo-Croatian; not necessarily in Northern Macedonia, however, for Constantine Porphyrogenitus speaks of Servians near Salonica. Aside from its philological importance, Church Slavonic is indispensable for the history of mediæval literature, serving beside the Christian Greek and Latin as the third international literary language. From the tenth century to the seventeenth a wealth of patristic literature, including lives, legends, and homilies, was assiduously translated—from the tenth to the fourteenth centuries especially in the South, but later also in Russia. It was also the state language in Bulgaria, Serbia, Bosnia, Russia (including Lithuania), Moldavia, and Wallachia; and while its supremacy, like that of Latin in the West, ceased with the end of the seventeenth century, yet even to-day the Russian literary language rests on centuries of Church Slavonic traditions as to forms, vocabulary, and orthography. See RUSSIAN LANGUAGE.

#### INDIVIDUAL SLAVIC LANGUAGES.

7. The southern Slavs, who in Byzantine times migrated in larger or smaller bands into the regions of the Hæmus, the Adriatic, and the Alps, are all called by Byzantine historians (Procopius, Menander, Theophanes, Theophylactus) by the name *Σλαβηνοί*, equivalent to Slav. *Slovéne*, adj. *slovénskú*, a name continually met with in all historical periods in the Slavic South. The Bulgarians were originally called *Slovéne* both by themselves and others, and their language *slovénskú*. The inhabitants of Styria, Carinthia, Carniola, and the coast around Trieste and Gorz are still called *Slovenoi*, and their language Slovenian. The republic of Ragusa also, in spite of the identity of its language with the inland Servo-Croatian, held in its rich poetical literature of the fifteenth to the eighteenth centuries to the name of "Slovinian." Hence the Byzantine name *Σλαβηνοί* must have designated the whole of the southern Slavs. These tribes have never attained to a political or cultural unity. In Carinthia, Styria, and Carniola they early submitted to the Germans, and their closely resembling dialects formed the basis of the present Slovenian language. The dialect of Carniola forms the basis of the literary language. Slovenian was first treated grammatically by Kopitar (1808), later by Metelko, Dainko, Murko, and more recently by Miklosich, Levstik, and Šuman. A complete dictionary is (1895) being edited by Pleteršnik.

Nearest related to the Slovenian is the language of Slavonia in the old sense of the term, that is, of the region between the Save, Drave, and Mur (including scattered areas N. of the Mur in South Hungary). It probably extended formerly much farther toward the E., but the populations driven out of the Balkan Peninsula by the Turks entered the present Slavonia in such numbers that the Old Slovenian of the former kingdom of Slavonia is now restricted to the counties of Warasdin, Kreuz (Križevci), Agram, nearly to Belovar and Wirovitice. Since the end of the seventeenth century, this region has been known as Croatia and its language as Horvatian. Its literature began with the Protestant movement, and furnished in the seventeenth and eighteenth centuries a series of important prose works (also dictionaries by Belosteneć and Habdelić). It continued as a literary language until the rise of Illyrianism in Agram, after 1830, led to its displacement by the richer and more extended Servo-Croatian. As a popular dialect it still continues. It is often called the *kaj* dialect, from its use of the word *kaj* (quid?).

8. The Croatians proper and Servians extend farther south, roughly from the river Kulpa throughout Istria, the islands, the Croatian coast, Dalmatia, Montenegro, and throughout the interior (Bosnia, Herzegovina, Old Servia, Servia), and northward beyond the Save throughout Slavonia, Syrmia,

and Southern Hungary. The popular language deviates more or less from the literary dialect according to locality. That of Southwestern Serbia and Herzegovina, together with the Bezirk of Ragusa, is nearest in character to the literary dialect. Montenegrin offers many peculiarities in pronunciation and syntax. As a result of ecclesiastical and political separation, the Servians and Croatians, so nearly related in language, have had a very diverse historical development. Though both were originally converted by Rome, and both accepted the Slavic liturgy in the ninth century, the separation of the Church into Eastern and Western soon afterwards divided them into two hostile camps, Servia holding firmly to Constantinople and to Church Slavonic, while in the West the influence of Rome in ecclesiastical and public matters constantly increased. Not only in the old Romance cities of Dalmatia, but in the independent principality of Croatia, Latin was the ruling language in Church and state, though Church Slavonic still had a limited use in private congregational matters. After the end of the fourteenth century the popular language was used with Latin characters, at first in prose works for Christian instruction, but by the end of the fifteenth century for a poetical literature which reached its richest development in Ragusa in the seventeenth century. In 1595 Faustus Verantius (Vrančić) treated the "Dalmatian" (for so he called it) lexicographically and proved the Slavic loan-words in Hungarian. In 1604 appeared the first grammar of the "Illyrian" language by Bartholomew Kasić, and in 1649 a valuable dictionary by Jacobus Micalia. The literary life of Dalmatia spread to Bosnia in the sixteenth century—at least among Catholic adherents—and in the seventeenth and eighteenth books were printed in the popular language for circulation in Bosnia, with both the Cyrillic and Latin alphabets. The true founder of the popular language as a literary dialect for the Servians is Vuk Stef. Karadžić, who published much popular material, principally songs, in the second and third decades of the nineteenth century, and based the Cyrillic orthography on phonetic principles. Since this Servian dialect of Vuk is the same as the Dalmatian of the fifteenth to the eighteenth centuries (later used also in Bosnia), which, as above mentioned, was introduced into Agram in 1835 under the name of Illyrian, these two long separated branches have at last been united again into the Servo-Croatian literary language. Though this still preserves a dualism in name (Servian and Croatian), and in the use of different alphabets (Cyrillic and Latin), it is one in grammar and vocabulary. Vuk prepared a small grammar and an excellent dictionary (2d ed. 1852). The great *Academic Dictionary of the Croatian or Servian Language*, begun by G. Daničić (1882), is being published by the South Slavic Academy in Agram.

9. Most peculiar in its development has been the language of the Bulgarians, who borrowed their name from their Turkish conquerors, the Bulgars. They live, to the number of about 3,000,000, E. of the Servians on the lower Danube in the Balkan and Rhodope Mountains, in Roumelia nearly as far as Adrianople, and in a large part of Macedonia. They were originally composed of seven Slovenian tribes, whose branches may have extended to the south as far as Greece, and northward as far as Eastern Pannonia and Transylvania; the resulting dialectal differences are not yet wholly obliterated. Besides the use of a post-positive article, Bulgarian has lost the true Slavic declension, replacing it by prepositions with the general case, which gives it a strange appearance in comparison with all other, even southern, Slavic dialects, with which in other ways it has many points of contact. This phenomenon probably dates back to the fourteenth century, and may have been partly due to the influence of Roumanian, in which it certainly developed much earlier. The Slavic conjugation, however, except for the loss of the infinitive, has been retained in Bulgarian in its old form, agreeing with the eastern Servo-Croatian dialects even in the formation of the future by means of the auxiliary *šlā* (from *chošlā*), and with all South Slavic dialects in the use of the conjunction *da* with object clauses (instead of *že* *iz* in Northwest Slavic, and *da*—*sto* in Russian). As noted above, Bulgaria was for a long time the center of Church Slavonic literary activity (under the Emperor Simeon, 927 A. D., and his immediate successors). As a result, the popular language does not appear in literature before the seventeenth century, and must be gathered from fragments found scattered through the Church Slavonic texts. The language was made known to the literary world by Vuk Stef. Karadžić and Kopitar, having been scarcely known to Dobrowsky, and has been investigated

The Polish language is characterized most strongly among all the living Slavic languages by retention of the original Slavic nasalization: cf. prim. Slav. *dǫbŭ-dǫba-dǫbu*, Polish *dąb-dębu*; prim. Slav. *rǫka-rǫka-rǫkŭ*, Polish *ręka-ręke-ręk*. The Polish is rich, almost too rich, in sibilants, the original Slav. groups *te-ti*, *de-di* being assibilated: *cie* (i. e. *čē*), *ci* (i. e. *čī*), *dzie* (i. e. *dže*), *dzi* (i. e. *dží*); so also *s*, *z*, before palatal vowels become *ś*, *ź*; *siano* (i. e. *šano*) *ziemia* (i. e. *žēma*). Polish differs widely from Czech in the treatment of the old Church Slav. vowel *ě*, making it now *ie* (before soft sounds), now *ia* (before hard); thus *wiatr* (Czech. *větr*, genit. *větru*), but *wierny*, *wierzyć* (Czech. *věřit*). Polish forms from *or* + cons. and *of* + cons. not *ra-ta*, like Cecho-Slovak. and South Slav., but *ro-to*, like Lusatian-Servian; *er* + cons. and *el* + cons. do not yield *ré* + cons., *lé* + cons. as in Czech and South Slav., but *re* + cons., *le* + cons., e. g. Czech *břez* or *břiza*, Pol. *brzoza*. Polish has no *r*-, *l*-sonans. In the umlaut of *ie* > *i* Polish is akin to Russian. Polish has retained *t* (hard) and *l* (palatal), whereas Czech has in recent centuries entirely relinquished *ř*. Beside other peculiarities of the Polish is to be noted its constant accentuation of the penultimate syllable, as distinguished from Czech and Lusatian-Servian, which accentuate the first; also its lack of distinctions in quantity as contrasted with the many long syllables, notably final ones, in Czech.

14. The Casubian was regarded by Kryński, Biśkupski, and Pobłocki as a dialect of Polish, but by most scholars has been more correctly regarded as the last remnant of the language of those Slavs who formerly extended throughout Pomerania and beyond the Oder to the Elbe. The Casubians of to-day (also called Slowincians or Slowincians) are a poor fishing people around the Gulf of Dantzig and in some places in the provinces of West Prussia (Putzig, Neustadt, Karthaus, Dantzig, Berent, Konitz, Schlochau) and Pomerania (Lauenburg, Stolp, Bütov), and number over 150,000. A comparison of their language (treated by Cenowa, Hilferding, Biśkupski, and others) with Polabian (as set forth by Schleicher) shows conclusively that Polabian and Pomeranian had much in common that can not be found in Polish. A most serviceable dictionary of Casubian by Ramult was published by the Cracow Academy in 1893.

15. For an account of the Russian dialects, see RUSSIAN LANGUAGES. V. JAGIĆ.

**Slavo'nia** [= Late Lat., deriv. of *Slavus*, Slav; cf. O. Bulg. *Slavie nŭnŭ*; Russ. *Slavya'ninŭ*, Slav, Slavonian; perhaps connected with O. Bulg. *slavo*, word, *slava*, glory]: a territory of Austria-Hungary, forming with Croatia a province attached to Hungary; bounded N. by the Drave and S. by the Save, and E. by the Danube. Area, 9,106 sq. miles. A branch of the Carnian Alps enters Slavonia from the W., and traverses it in its whole length, forming the watershed between the Drave and the Save, and terminating somewhat abruptly on the banks of the Danube. These mountains, which nowhere rise above 2,700 feet, are rich in copper, iron, lead, and beautiful marble, and their slopes are clothed with fine timber-yielding forests, vineyards which produce a sweet, strong, richly flavored wine, and orchards in which apples, pears, cherries, and peaches, figs, oranges, and walnuts ripen to perfection. Along the rivers extend low, rather marshy, but very fertile plains, where large crops of wheat and maize are raised and immense herds of cattle and swine reared. Of manufactures there are almost none; some linen fabrics are made from the excellent flax and hemp which are raised, but only for home use. The inhabitants, who call themselves *Slavonatz* and their country *Slavonska*, are at once warlike and dreamy, fond of music, poetry, and dancing, excelling in all kinds of horsemanship, and preferring the life of the shepherd to that of the tiller of the soil. They are deeply attached to their fatherland and proud of their nationality, and of late political ideas and passions have begun to play a conspicuous part in their lives. See CROATIA.

Revised by M. W. HARRINGTON.

**Slavs** [from Germ. *Sklave*, *Slave*, from the Slavic forms. See SLAVONIA]: a race of Indo-European relationship, characterized chiefly by their speech and constituting three-tenths of the population of Europe, and divided into three main branches—Eastern, Western, and Southern. To the first belong the Russians and Ruthenians; to the second, the Poles, the Czechs, the Slovaks, and the Wends; to the third, the Bulgarians, the Servians and Croats, and the Slovenes. For the Slavic population of Austria-Hungary, Prussia, and Russia, see the articles on those countries.

No information is given, even by legends, as to the first appearance of the Slavs in Europe. In the fourth century they were found in great numbers in the neighborhood of the Carpathians, and that is supposed to have been one of their earliest homes. Thither point the legends of many Slavonic peoples, especially the Poles and Czechs, and thence the Slavonic settlers appear to have spread northward to the Baltic and southward to the Adriatic. The earliest authentic records of the Slavs are given by Procopius, Jordanes, Agathias, the Emperor Maurice, and other writers during the second half of the sixth century. These authors all lived in Byzantium or in Italy, and were personally acquainted only with the Southern Slavs, who dwelt on the lower Danube and spread through ancient Mœsia and Pannonia. The Northern Slavs they knew by report only. No political unity seems ever to have existed among these early Slavs, but their different bodies consolidated at various periods between the seventh and eleventh centuries into monarchies, of which most have virtually disappeared. To the early Slavs, Jordanes and some other writers give the name of Wends, by which name the Slavonic inhabitants of Lusatia are still known to their German neighbors. This designation, under various kindred forms, appears to have been applied to Slavs by foreigners, just as that of Welsh (*Wâlche*) was given by the Teutonic to the Latin-speaking peoples.

Of the ancient Slavs little information can be obtained except from the writings of Greeks, Germans, Arabs, and other foreigners. They appear to have differed but little in the various lands which they occupied, everywhere bearing the character of being a brave and hardy race, given to agriculture, and of a peaceable nature, except where they were influenced by more martial neighbors. Some modern writers suppose that the Slavs formed into clans, others that the foundation of Slavonic society was the family community. Among the Western Slavs, at least, a cluster of such communities formed a *jupa*, or district, at the head of which was a *jupan*, or chief, and in its center a *grad*, or town. The mode of life among all the Slavonic tribes was patriarchal, the father ruling his family with despotic power. Polygamy prevailed among them in heathen times, and also a kind of uterineism, but women do not seem to have occupied an altogether degraded position. Of Slavonic heathenism not much is known, but its deities appear to have been for the most part personifications of nature-forces. Vague recollections survive of Svarog, the heaven-god, answering to the Greek Ouranos, the Vedic Varuna. He appears to have given place, in some parts, to a solar deity, Dazhbog, together with whom, as the representative of the sun, a Khors is mentioned. Another solar deity was Volos or Veles, the special protector of cattle, surviving in Christian times as St. Blasius or Vlasy. Kupalo and Garilo are supposed to have been representatives of the summer sun, the fertilizer of the earth. Fire is said to have been worshiped under the name of Ogon, answering to the Vedic Agni, and there was a wind-god, Strigob; but the chief deity of the Northeastern Slavs was Perun, the thunder-god, answering to the Teutonic Thor, and supposed to be the European representative of the Vedic Parjanya. Among the Western Slavs other deities were worshiped, such as Radigost and Sviatovit, and the three-headed Triglav, of whose images detailed accounts are given by old writers. These Western Slavs appear to have had temples and priests, but it is doubtful whether this was the case among their Eastern brethren. Of inferior deities the memory is still preserved in the belief of the common people of all Slavonic lands in Rusalkas, Vilas, and many other supernatural beings supposed to haunt woods, waters, and pastures. The Western Slavs appear to have been the first to accept Christianity, many of the Moravians, for instance, having been converted as early as the seventh century, their religious teachings coming from the West; but the submission of the great body of Slavs dates from the mission of the Greek monks Cyril and Methodius in the ninth century. See SLAV LANGUAGES.

Revised by M. W. HARRINGTON.

**Sleep** [O. Eng. *slēp*; O. Sax. *slāp*; O. H. Germ. *slāf* (> Mod. Germ. *schlaf*); Goth. *slēps*; cf. Lat. *la'bi*, *lapsus*, glide, slide, fall down, whence Eng. *lapse*]: a condition of the organism, normal, and occurring generally periodically, in which there is a more or less complete suspension of consciousness and the power of voluntary motion. It is somewhat difficult to analyze the various phenomena which go to make up the condition called sleepiness. The most

series, vol. vi., 1860); Maury, *Le Sommeil et les Rêves* (Paris, 1865); Hammond, *On Wakefulness, with an Introductory Chapter on the Physiology of Sleep* (Philadelphia, 1865), and *Sleep and its Derangements* (Philadelphia, 1869); Czerny, *Untersuchung über den Schlaf* (Prag Med. Wochenschr., 1892, No. 4); Rosenbaum, *Warum müssen wir schlafen?* (Berlin, 1892); Weygand, *Production des Rêves* (Leipzig, 1893); Wundt, *Lectures on Human and Animal Psychology* (New York, 1894), p. 323.

Revised by J. MARK BALDWIN.

**Sleeper:** any one of several sharks or fishes: (1) Either one of the nurse-sharks. (See NURSE-SHARK.) (2) In some of the West Indian islands a gobioid fish of the sub-family *Eleotridinae*; these rarely exceed a foot in length, and are of an elongated form, with two separated dorsal fins, the first of which has six slender spines, and thoracic ventral fins, which have each a spine and five rays.

**Sleep of Plants:** the nocturnal condition of many plants. Many leaves assume a particular position at night-fall or when placed in a darkened room, as is notably the case with certain sorrels (*Oxalis*), clovers (*Trifolium*), sensitive plants (*Mimosa*), and other *Leguminosae*. Many flowers close at night and open again in the morning, as of species of *Portulaca* and *Oxalis*, and the dandelion and many other *Compositae*. C. E. B.

**Sleepy Eye:** village; Brown co., Minn.; on Sleepy Eye Lake, and the Chi. and N. W. Railway; 48 miles W. of Mankato (for location, see map of Minnesota, ref. 10-D). It is in an agricultural region, and contains 6 churches, a State high school, 2 parochial schools, 6 warehouses and grain elevators, flour-mill, brewery, creamery, electric lights, a State bank with capital of \$25,000, a private bank, and two weekly newspapers. The place was named in honor of Ish-a-hum-bak, an Indian chief who was friendly to the whites during the massacre of 1861, the name meaning "Man whose eyes have appearance of sleep." Pop. (1880) 997; (1890) 1,513; (1895) estimated, 2,200.

EDITOR OF "DISPATCH."

**Sleidan, JOHANN**, whose true name was PHILIPPSOHN; historian; b. at Schleiden, 42 miles S. W. of Cologne, 1506; studied at Louvain and Paris and jurisprudence at Orleans; was secretary to Cardinal du Bellay, minister to Francis I., King of France (1536-41), although at Louvain he had imbibed Protestant opinions; was the representative of Francis I. at the Diet of Regensburg; led a wandering life till 1543 when he settled in Strassburg, which thenceforth was his home. He was appointed historiographer by the princes of the Smalkaldian League; represented Strassburg at the Council of Trent (1551), and on his return became Professor of Law. D. in Strassburg, Oct. 31, 1556. His fame rests upon his great history, *De statu religionis et reipublice Carolo Quinto Cesare commentarii* (Strassburg, 1553-56; best ed. by Chr. C. am Ende, 3 vols., Frankfurt, 1785-86), which gives a history of the Reformation from 1517 to 1556, resting on documentary evidence. It remains "the most valuable contemporary history of the Reformation, and contains the largest collection of important documents." It was translated into French (Geneva, 1557; new trans. The Hague, 1787), Italian (Florence, 1557), English (*A famous cronicle of our time, called Sleidan's commentaries*, etc., translated by John Daus, London, 1560; same, edited by Edmund Bohun, under title *The General History of the Reformation, etc., 1517-1556, with continuation to 1563*, 1689), and German (Frankfurt, 1567, n. e. Halle, 1770-73, 4 parts). Another famous work, often reprinted, was his *De quatuor summis imperiis, Babylonico, Persico, Graeco, et Romano* (Strassburg, 1556; n. e. Amsterdam, 1705; Eng. trans. *The Key of History*, London, 1627, new trans. 1695; French trans. Geneva, 1563). His *Opuscula* appeared at Hanau, 1608. See his *Life* by H. Baumgarten (Strassburg, 1878), who also edited his correspondence (*Sleidans Briefwechsel*), 1881.

SAMUEL MACAULEY JACKSON.

**Slemmer, ADAM J.**: soldier; b. in Montgomery co., Pa., in 1828. He graduated from the U. S. Military Academy July 1, 1850, and was appointed brevet second lieutenant in the artillery; first lieutenant 1854. Detailed for duty at West Point in 1855, he served as Assistant Professor of Geography and History a year, and of Mathematics 1856-59. In the latter year he was ordered to Fort Moultrie, S. C., and in 1860 was transferred to Florida, where, in 1861, he commanded the small body of U. S. troops in Pensacola harbor, occupying with them Fort Barrancas and the neighboring feeble barracks. When intelligence of the surrender of the

Pensacola navy-yard to the Confederates reached him, he transferred (Jan. 10) his command to Fort Pickens, opposite, which action prevented the seizure of that important work. In May, 1862, he was attached to Gen. Buell's army, and participated in the siege of Corinth and in the subsequent movement to Louisville, Ky., and to the relief of Nashville, Tenn. He was commissioned a brigadier-general of volunteers Nov. 29, 1862, and engaged in the battle of Murfreesboro Dec. 31, where he was severely wounded and incapacitated from further active service in the field. He was promoted lieutenant-colonel Fourth Infantry Feb., 1864, and in Aug., 1865, he was mustered out of the volunteer service, and breveted colonel and brigadier-general. D. at Fort Laramie, Kansas, Oct. 7, 1868.

**Sleswick:** another spelling of SCHLESWIG (q. v.).

**Slickensides:** a peculiar polished and striated surface found commonly on the wall-rocks of mineral veins or faults, and where slate, shale, coal, and other fine materials have been crumpled and folded by pressure. Not unfrequently a foreign body, such as a concretion, shell, or nut lying in an argillaceous rock of which the particles have been moved on each other with great force, shows the polished striated surface to which this name has been given.

**Slidell, JOHN:** statesman; b. in New York about 1793; graduated at Columbia College 1810; settled at New Orleans, where he became a distinguished lawyer; U. S. district attorney 1829-33; member of Congress 1843-45; appointed minister to Mexico 1845, but not received by the Mexican Government; was U. S. Senator 1853-61, but withdrew in consequence of the secession of his State, which he had done much to promote. Sailing from Charleston as commissioner of the Confederate government to France, he and his associate, James M. Mason, ran the blockade and embarked at Havana on the British steamer Trent. On Nov. 8, 1861, Capt. Wilkes, of the U. S. frigate San Jacinto, stopped the Trent, seized the two commissioners, and brought them back to the U. S., where they were held prisoners at Fort Warren in Boston harbor. Bitter denunciations of the seizure appeared in the British press, and the attitude of the British Government was for the moment very threatening, but the U. S. disavowed the act of Wilkes and released the prisoners Jan. 1, 1862, thus putting an end to the difficulty. After the war Slidell settled in London, where he died July 29, 1871.

**Slide-rule:** an instrument for solving arithmetical problems where approximate results are sufficiently accurate. The form invented by William Oughtred (1573-1660) is best known, and the more precise one introduced by Edwin Thacher in 1885 is much used by engineers. The principle is that of logarithms, the divisions on one scale being those of the logarithms of numbers from 1 to 100, or from 1 to 1,000, while the numbers themselves are marked at the divisions of the other; by sliding one scale along the other the products and quotients of two numbers may be read off by inspection.

MANSFIELD MERRIMAN.

**Sligo:** county in the province of Connaught, Ireland, bordering N. on the Atlantic. Area, 721 sq. miles. The surface rises from the coast toward the E. and N. E., reaching 1,778 feet in the Ox Mountains. The western part is level, the soil mostly consisting of a light sandy or gravelly loam, interspersed with patches of bog. There are, however, districts with a deep and rich soil well adapted for tillage. Agriculture is the principal occupation, especially cattle-breeding and dairy-farming. Some coarse woollen stuffs are manufactured, and fishing is carried on. Two members are returned to the House of Commons. Pop. (1891) 98,013. Principal town, Sligo, at the mouth of the Garvogue, 137 miles by rail N. W. of Dublin, at the head of the Bay of Sligo (see map of Ireland, ref. 6-F). It has a good harbor, and exports cattle, grain, butter, etc. Sligo has a Roman Catholic cathedral and a modern town-hall. Pop. (1891) 10,110.

**Slime-moulds:** the *Mycetozoa* or *Myxomycetes*, a group of organisms of doubtful affinity; when referred to the animal kingdom called by the former name, when to the vegetable kingdom by the latter. They have hitherto been commonly regarded as plants, but are more probably related most closely to the rhizopods among animals. In their growing stage they consist of a naked mass of protoplasm of indefinite size and shape, and here their resemblance to the rhizopodous infusorians is evident; but in their reproductive stage they are definitely circumscribed masses of dry spores, here reminding one of some of the puff-balls

branched threads extending from the columella to the peridium. Sporangia single or coalesced into an aethalium.

*Diachea* and *Spumaria* (Fig. 8) are the genera.

FIG. 8.—*Spumaria alba*, natural size.

Family *Didymiaceæ*. With lime (mostly in crystals in the outer wall of the peridium); capillitium of delicate tubes or filaments, without lime, extending from the columella or base of the sporangium to the peridium. Columella none or short, hemispherical, or orbicular. "Fruit" an orthosporangium or a plasmodiocarp.

The more important genera are *Didymium* and *Chondrioderma* (Fig. 9).

Family *Physaraceæ*. With lime in granules; capillitium a net of hyaline, thin-walled, broad tubes, usually filled with lime; columella usually wanting. "Fruit" mostly an orthosporangium, less commonly a plasmodiocarp or an aethalium.

The common genera of this large family are *Tilmadoche*, *Leocarpus*, *Physarum* (Fig. 10), *Badhamia*, and *Fuligo* (Fig. 11).

Allied to the slime-moulds proper are two other groups, the *Acrasieæ* and *Phytomyxineæ*—classes they may conveniently be called—which are to be regarded as simpler and lower than the foregoing. They may be noted as follows:

Class *ACRASIEÆ*. With no true plasmodium, the amœboid swarm-spores not fusing; saprophytic; in fruit consisting of rounded heaps of free spores.

FIG. 9.—*Chondrioderma floriforme*, enlarged fifteen times: 1, unopened; 2, 3, ruptured, showing spores; 4, showing columella.

Several genera of these low organisms, falling into two groups, are known. They occur upon manure and other decaying matter.

Class *PHYTOMYXINÆ*. With a true plasmodium, parasitic in the cells of higher plants, in fruit dividing into a mass of spores. The organisms here brought together are but obscurely known. *Plasmodiophora brassicæ* (Fig. 12) occurs in the roots of cabbage, causing club-root. *Phytomyxa leguminosarum* causes the root-tubercles of clover and many other leguminous plants.

Zopf has added many other organisms to the slime-moulds, such as *Vampyrella*, *Bursulla*, *Colpodella*, *Protomonas*, *Protomyxa*, etc., whose animal nature has never been seriously doubted and whose affinities to the higher slime-moulds are evident.

As to their place in nature, the writer must agree with de Bary in placing them "outside the limits of the vegetable kingdom." If plants, they are so unlike all others that they must be regarded as belonging to a different genetic line. To set them off in a group by themselves would be merely an evasion of the question. Divesting one's self of prejudice and rightly esti-

FIG. 10.—*Physarum sinuosum*, natural size.

imating the value of their resemblance to and their differences from plants, one is compelled to admit that their resemblances to any plants are merely superficial (e. g. to some puff-balls), while their differences are profound. On the

other hand, in their structure, both in the vegetative and reproductive stages, they exhibit such striking similarity to the lower protozoans that one can not avoid the conclusion that their real relationship is with these lower animals rather than with plants. Among investigators who have placed the slime-moulds outside the vegetable kingdom are the following: de Bary (1858), Haeckel (1866), Allman (1879), Kent (1880), Zopf (1887), Rolleston and Jackson (1887), Bennett and Murray (1889), Lister (1890). On the other hand, those who have devoted themselves to a study of these organisms, systematically or descriptively, generally regard them as plants—e. g. Rostafinski (1875) probably, Cook (1877), Berlese (1888), Schroeter (1889), McBride (1892), Massee (1892).

FIG. 12.—*Plasmodiophora brassicæ*: I, cabbage-root, swollen, natural size; II, cells of affected cabbage,  $\times 50$ ; III, spores,  $\times 600$ ; IV, spores germinating; V, amœboid masses.

LITERATURE.—A. de Bary, *Die Mycetozoen* (1859); *Vergleichende Morphologie und Biologie der Pilze, Mycetozoen und Bacterien* (1884; Eng. trans. 1887); J. Rostafinski, *Sluzowce (Mycetozoa) Monografia* (1875); M. C. Cooke, *The Myxomycetes of Great Britain* (1877); *The Myxomycetes of the United States* (1877); C. E. Bessey, *Botany for High Schools and Colleges* (1880; 7th edition 1892); W. Saville Kent, *A Manual of the Infusoria* (1880); *The Myxomycetes or Mycetozoa: Animals or Plants?* (1881); W. Zopf, *Die Pilzthiere oder Schleimpilze* (1887); A. N. Berlese, *Mycetozoen*, in Saccardo's *Sylloge Fungorum*, vol. vii. (1888); J. Schroeter, *Myxomycetes*, in Engler and Prantl's *Die Natürlichen Pflanzenfamilien* (1889); Bennett and Murray's *Handbook of Cryptogamic Botany* (1889); McBride, *The Myxomycetes of Eastern Iowa* (1892); G. Massee, *A Monograph of the Myxogastres* (1892). CHARLES E. BESSEY.

**Sling**: a simple contrivance for hurling missiles, consisting of a small disk of leather pierced by a hole and suspended by one, two, or three strings, say a yard long. A stone or other missile was placed upon the leathern disk, and then whirled rapidly about for a time, when one of the strings was dropped from the hand at the proper instant, and the missile sent with great force through the air. The ancient Greek light-armed troops in the Persian wars and afterward used the sling, often with a plummet of lead instead of a stone. These bullets are well known to antiquarians. They frequently bear the word *ΔΕΕΛ* "Take this," or some similar word. The Persians, Achæans, Acarnanians, and especially the Balearic islanders, were famous slingers. The sling was also used by several half-savage peoples, as the Tahitians.

**Sliv'no**, or **Selim'nia** (Bulg. *Sliven*): town in Bulgaria (see map of Turkey, ref. 3-D); commanding on the S. the important pass in the Balkans called the Iron Gate; carries on an active trade in wool and arms. Pop. (1893) 23,210.

was strongly opposed by the Magyars and the Czechs alike, but Slovak literature nevertheless developed. Poets of repute were active: Holly wrote an epic on Svatopluk in twelve books in classical style and meter and a Cyrillo-Methodiad in six books. He died in 1849, just at the great outbreak of the Hungarian revolution against the house of Hapsburg. Ljudevit Štur (b. 1815; d. 1856), studied in Pressburg and Halle, wrote some German pamphlets against the Magyars as the oppressors of the Slovak people, and edited in 1845-48 the Slovak newspaper *Slovenské Noviny* with the literary supplement *Orol Tatranski*. The revolution drove him from Hungary, and he fled to Vienna, where he became one of the fiercest agitators against the Magyars, while his great countryman Kossuth, entirely Magyarized, led the Hungarian revolution against Austria. By his paper and personal influence Štur raised Slovak to the standard of the literary language of his people. He also wrote in Czech a critical work on the character of Slavic popular poetry (Prague, 1853), and left a manuscript in German *Das Slaventhum und die Welt der Zukunft*, the first great Slavophil work, translated by W. Lamanskij into Russian (Moscow, 1867).

A number of other poets have gained a good reputation in Slovak literature, which seems firmly established, even if the process of Magyarization should succeed in obliterating the nationality of the people.

The most important and influential modern educator, grammarian, and framer of the Slovak language is Martin Hattala, born in 1821, at Trstená, Hungary. Originally a Catholic priest, he wrote a *Grammatica linguae Slovenicae* (Schemnitz, 1840), which secured for him a call as Professor of Slavic Languages to Prague. His principal merit is the elaboration of the Slovak language in phonetics, form, syntax: *Phonology of the Old and New Czech and Slovak Languages* (Prague, 1854); *Comparative Grammar of the Czech and Slovak Languages* (Prague, 1857); *Antibarbarus of the Czech Language* (Brus jazyka českého, Prague, 1877); text-books for Slovak schools, etc. His polemical writings against Schleicher, and his defense of the genuineness of the Königinhof Manuscript (*Rukopis Kralodvorský*) are noteworthy. Besides him three men eminently contributed to the definite settlement of Slovak language and literature: J. Victorin, by his *Grammatik der slowakischen Sprache* (4th ed. by Loos, Budapest, 1876); J. Loos, by his *Wörterbuch der slowakischen, ungarischen und deutschen Sprache* (Budapest, 1871); and Šembera, by his excellent treatment of Czech-Slovak dialectology (*Základové dialektologie česko-slovenské*, Vienna, 1864).

The chief collections of Slovak popular poems are by Šafárik (2 vols., Pest, 1823-27); Kollar (2 vols., Buda, 1834-35; *Národné Zpěvanky*); and by the Slovak Matica (suppressed by the Magyars) *Sborník Slovenských národních písní* (Collection of Slovak National Songs, 2 vols., 1870-74).

HERMANN SCHOENFELD.

**Slove'nian Language:** See SLAVIC LANGUAGES.

**Slovenian Literature:** the literature produced by that branch of the Slavic family which inhabits the southern portion of Carinthia and Styria, all Carniola (except the great German speech-island around Gottschee), Görz and Gradiska, a small part of Istria, the region around Radkersburg in Hungary and around Cividale in Italy—total population (1895), about 1,300,000.

This literature is most closely related to that of the Servo-Croats. It is written in a language the oldest form of which is held by some of the greatest and most authoritative scholars—Kopitar, Miklosich, Daničić and Jagić—to be the mother language of Palæo-Slavonic, as preserved to us. Great zeal has been exhibited in fixing the grammatical structure of the language. This labor has been performed by scholars like Kopitar, Metelko, Murko, Jančič, Lewstik, and, best of all, Suman (*Slovenska slovnica*, Klagenfurth, 1884).

The only literary monument of Old Slovenian is the liturgical manuscript of Freising (Bavaria). It is in Latin script, and belongs to the tenth century (ed. by Kopitar in *Glagolita Klotianus*, Vienna, 1836). Then, until the middle of the sixteenth century, there was nothing that can be classed as literature. With the Reformation literary interest revived. The Carinthian reformer Primus Truber (1508-86) and his associates translated the New Testament into Slovenian in 1557. The first complete edition of the Bible on the Protestant side appeared first in 1584 in Tübingen. Other spiritual and church books, too, were composed by Truber,

but he was driven into exile, and the incipient reformatory movement suppressed by the counter-reformation. Literary activity again practically ceased until the end of the eighteenth century. Only meager grammatical and bibliographical work was produced. The first Slovenian grammar appeared in 1584, the first dictionary in 1592.

Toward the end of the eighteenth century, however, self-consciousness began to awaken among the Slovenes, as well as in the entire South Slavonic world, stimulated especially by the longing for liberty and by the Roman Catholic Church. On the Catholic side a complete Bible translation, presented by Japel and Kumerdey, was issued 1791-1802. Secular literature, too, began to flourish; Valentin Vodnik (1758-1819) was its founder. When Carinthia was incorporated into the Illyrian provinces by Napoleon and belonged to France (1810-14), he published his *Ilirja oživila* (Illyria revived), which cost him his position as inspector of schools when Austria regained her provinces. He also wrote valuable poems (*Pesmi*, 3d ed. Laibach, 1869), and edited the first Slovenian newspaper (1797-1800). The greatest modern Slovenian poet, however, is Francis Prešern (1800-49); his poems are mostly lyrics (complete edition, *Pesmi Francela Prešerna*, Laibach, 1866; German trans. by Samhaber, *Prešerenklänge*, Laibach, 1880).

Since the middle of the nineteenth century national life has steadily developed, and the political revival has been accompanied by an increase of literary productions of a varied character. Levstik, Valjavec, and Stritter are very good national poets. The Matica Slovenska (Slovenian Literary Society) is the center of the literary movement. The periodical *Ljubljanski Zvon* (The Laibach Bell) is the great organ in which the national productions mostly appear.

The principal collections of Slovene folk-song are *Slovenske pesmi krajnskago naroda* (5 vols., Laibach, 1839-44); *Narodne pesmi ilirske* (Styria, Carinthia, West Hungary), by Stanko Vrac (Agram, 1839); *Volkslieder aus Krain*, trans. by A. Grün (Count Auersperg), Leipzig, 1850; *Cvetje slovenskega naroda*, by A. Jančič (Klagenfurth, 1852). See Child, *Ballads*.

**BIBLIOGRAPHY.**—Kleinmayr gives an excellent sketch of Slovene literature, *Zgodovina slovenskega slovstva* (Klagenfurth, 1881); see also Pypin and Spasovič, *Istorija slavonskih literatur* (St. Petersburg, 1865; German by Tr. Fsch, Leipzig, 1880-84).

HERMANN SCHOENFELD.

**Slows:** See MILK-SICKNESS.

**Sloyd:** See MANUAL TRAINING.

**Slug** [from M. Eng. *slugge*, slothful; cf. Eng. *slack*, *slouch*, and *sluggard*]: any one of various naked terrestrial molluscs, mostly members of the family *Limacidae* (see PUL-

The red slug.

**MONATA**). The name is sometimes applied to other molluscs, and occasionally, but wrongly, to certain insects which occur as pests in gardens and greenhouses.

**Slug-worms**, popularly but incorrectly called **Slugs**: the larvæ of certain of the saw-flies (*Tenthredinidae*), belonging to the *Hymenoptera*. They are slug-like in form. In the U. S. the pear, rose, vine, raspberry, walnut, linden, and other trees are infested with the larvæ of species of *Salix*, which are often very destructive. Decoctions of tobacco or quassia, whale-oil soap, a weak solution of carbolic acid, and petroleum are among the substances recommended for showering shrubs and trees infested with slug-worms. For small trees and shrubs hand-picking will generally prove sufficient.

**Smalcald:** See SCHMALKALDEN.

**Small, JOHN:** soldier; b. at Strathardle, Scotland, in 1726; served in the Scotch brigade, in the Dutch service, in the pursuit of the Jacobites of Scotland 1747, at Ticonderoga 1758, at Montreal 1760, and in the West Indies 1762; was in the battle of Bunker Hill; raised a corps of Highlanders in Nova Scotia, the Eighty-fourth Battalion, known as the "Royal Emigrants," which he commanded as major in the campaigns of New Jersey and Pennsylvania; became lieutenant-colonel 1780, lieutenant-governor of Guernsey 1783, and major-general 1794. D. at Guernsey, Mar. 17, 1796.

1869, and 1872; they mentioned favorably the Peabody, Remington, Sharps, and Springfield, and finally recommended the adoption of the latter arm.

The same decade witnessed the adoption abroad of arms that remained for nearly twenty years in the hands of troops, and which, while differing in many particulars, can be placed in two general classes dependent upon the method of breech-closure—viz., by a hinged block and by a sliding bolt. Of the first class the Remington, the Springfield of the U. S., and the Martini-Henry of Great Britain, and of the second class the Mauser of Germany and Berdan of Russia, are the best known. As these, with those of other countries, marked the highest development of the single-loading rifled breech-loader, their principal features are given in the accompanying table.

TABLE I.—SMALL-ARMS OF DIFFERENT NATIONS, 1874.

| NATION.       | Name of gun.  | When adopted. | Caliber, inch. | WEIGHT OF—   |                 |                 |                         |       | Initial velocity, foot-second. |
|---------------|---------------|---------------|----------------|--------------|-----------------|-----------------|-------------------------|-------|--------------------------------|
|               |               |               |                | Gun, pounds. | Bullet, grains. | Powder, grains. | 100 cartridges, pounds. |       |                                |
| Austria       | Werndl        | 1874          | 0.421          | 9.88         | 386             | 77              | 7.83                    | 1,410 |                                |
| Belgium       | Albini        | 1867          | 0.458          | 9.85         | 386             | 77              | 9.05                    | 1,367 |                                |
| Denmark       | Remington     | 1870          | 0.450          | 9.06         | 386             | 60              | 8.75                    | 1,300 |                                |
| France        | Gras          | 1874          | 0.438          | 9.25         | 386             | 81              | 9.52                    | 1,465 |                                |
| Germany       | Mauser        | 1871          | 0.435          | 9.76         | 386             | 77              | 9.25                    | 1,410 |                                |
| Great Britain | Martini-Henry | 1871          | 0.450          | 8.75         | 480             | 85              | 11.07                   | 1,362 |                                |
| Holland       | Beaumont      | 1871          | 0.493          | 9.59         | 386             | 68              | 8.57                    | 1,328 |                                |
| Italy         | Vetterli      | 1870          | 0.410          | 9.04         | 316             | 61              | 7.50                    | 1,445 |                                |
| Russia        | Berdan        | 1871          | 0.421          | 9.23         | 370             | 78              | 8.62                    | 1,400 |                                |
| Sweden        | Remington     | 1867          | 0.473          | 9.35         | 370             | 66              | 7.68                    | 1,312 |                                |
| Switzerland   | Vetterli      | 1874          | 0.410          | 10.34        | 316             | 56              | 6.75                    | 1,425 |                                |

| United States | Springfield   | 1873          | 0.450          | 8.68         | 405             | 70              | 8.75                    | 1,350 |                                |

Since 1885 there has been a great improvement in small-arms, the most important being the substitution of magazine-arms for the single-loaders (see MAGAZINE-GUNS), the decrease in the caliber of the barrel, and the adoption of smokeless powder in place of the powder formerly used.

As magazine systems were gradually developed the necessity of meeting the increased expenditure of ammunition with an augmented supply of cartridges became evident, but as the soldier's load was already at the limit considered practicable, this could only be accomplished by diminishing the weight of a single round, and that only by decreasing the diameter of the bullet and consequently of the bore of the rifle. This has resulted in the adoption in different countries of calibers between 0.315 and 0.256 inch, a decrease that probably has not yet reached its limit.

When gunpowder was used in these small bores, the fouling soon became excessive, unduly impairing the accuracy of fire. To overcome this trials were made which have led to the introduction of the so-called SMOKELESS POWDERS (*q. v.*). Many of these powders have been successfully developed and are in general use; their range of chamber-pressure varies from 14 or 15 tons per square inch, as with the powders used in the French Berthier and the Schmidt, to 20 tons in the Belgian Mauser and 21 tons in the German infantry rifle. This necessitates a strength and stiffness in the breech-mechanism of the new rifles that the old arms did not require, and also a corresponding increase of strength in the barrel. The modern barrels are therefore generally made of a superior grade of steel and of a little greater thickness of metal. Being of less interior diameter and also somewhat shorter, their weight, as compared with the old, has been diminished. With the augmented pressure also comes a great gain in the initial velocity, necessitating, in order to secure steadiness of flight for the bullet, a more rapid twist to the rifling, which now makes in all the new guns one turn in about 8 or 10 inches, instead of 18 to 24 inches as formerly. The majority of the barrels are rifled with four grooves (though some have only three and others six or seven), of a depth varying in the different countries from 0.003 to 0.006 inch, and more frequently of a width two or three times that of the lands.

As leaden bullets fired with high velocities through such barrels will not follow the rifling, but will strip and override the lands, it became necessary that the surface of the projectile be made of some harder metal; but to retain the high specific gravity of the lead, with the consequent ability of the ball better to overcome the resistance of the air, the greater portion of the bullet is made of a lead slug and then coated or jacketed with a covering, about 0.02 inch thick, of some harder metal, as steel, copper, nickel, or Ger-

man silver. These bullets have a length of about four calibers, are without the cannelures or lubricant of the lead ball, and weigh on the average about 220 grains.

The weights of the smokeless powder-charges vary with the particular powder, averaging about 30 to 40 grains.

The penetration of the bullet at all distances has been increased by the alteration in its shape, by its harder surface, and also, except at the extreme ranges where the air-resistance has overcome much of the velocity, by its more rapid initial movement. At the shorter ranges, 200 to 300 yards, protection is now obtained by about 0.2 inch of steel plate and about 0.3 inch of wrought iron. The penetration into earth at these distances is about 25 inches, into pine about 30 inches. As they have not been used to any extent in warfare their effect upon the living human body is yet to be fully determined; probably if striking no bone the bullets will inflict wounds on three or four men in file, but wounds less serious than those from the heavier lead ball.

With the greater number of the modern guns and powders the velocities are about 2,000 feet per second, running up for the smaller calibers, as the new guns of Italy, Holland, Roumania, and Norway, to about 2,500 feet per second. This gives a dangerous space in front of the muzzle of fully 600 yards, a maximum even exceeded by the extremely reduced calibers just mentioned, and a flatness of trajectory at all ranges compensating for errors when estimating the distance of the objective that would produce a miss with the old weapons.

The recoil is less than half that of the old single-loader.

The sights on all modern military arms are designed primarily for use in battle, rather than on the target-range; they are strong and simple in construction, with an open leaf that allows an unobstructed view when aiming, and generally without any arrangement giving drift or windage correction. The lowest adjustment is 300 meters (or yards), the leaf for that range being turned down on the base. Above that, on the leaf, the graduations are placed only for 100-meter (or yards) intervals, and with many of the sights it is impossible to obtain any closer adjustments than given by these limits, the slide engaging in notches that occur only at the graduation-marks. These latter generally extend up to 1,800 or 2,200 yards.

For the familiar triangular bayonet all nations except Russia have substituted knives with blades from 9 to 12 inches long and about an inch wide. The guards are short and usually straight, the handles of wood and steel, and about 4 inches long. The weights of the complete bayonets are from 8 to 15 oz.

The heat produced by discharge is much in excess of that formerly evolved; the barrels can not be freely handled after ten or twenty shots have been quickly delivered. To overcome this difficulty, the Germans have enveloped the barrel in a metallic case, and the Swiss have covered it with wood until it appears entirely surrounded by the forestock, but most of the other countries have limited the wooden hand-guard to the space back of the rear sight or else extended it only as far forward as the lower band. The latter provision is probably the best, affording all the protection required when firing or when carrying the piece afterward.

The breech-block of the single-loader has been replaced by a bolt having a sliding and generally also a turning movement. When closed it sustains the shock of discharge; moving it extracts the empty cartridge-case and recocks the piece for firing. In all countries these arms are also magazine-guns, that for the U. S., Fig. 8, having been chosen.

FIG. 8.—U. S. magazine rifle, model 1892.

the autumn of 1892. This arm was selected only after examination lasting nearly two years, careful consideration being given not only to the rifles used by the troops of Austria, Belgium, Denmark, Great Britain, France, Germany, Japan, Portugal, Roumania, Russia, and Switzerland, but also to those presented by the leading gun-inventors of the U. S. and Europe. The rifle finally chosen was the invention of Capt. O. Krag, director of the royal small-arms factory at Kongsberg, Norway, and E. Jørgensen, an armorer there employed.

The accompanying table gives the rifles and their ammunition forming (1895) the infantry armament of various countries.

• **Young's modulus**

These poems mark the culmination of a progress extending over forty years, beginning with a compilation that could scarcely claim precedence per tantum, and had a range of about 500 stanzas. Forty years later, the philosophical symbolism that was giving shape to the filled brush, under the influence of spirit and the freedom range, was increased twofold, and then the small-silver magazine title appeared, with a range of about 4,000 stanzas and capacity to report hundred of them nearly five stanzas per minute. STANLEY E. HENRY.

**Smalley, Vincent Wynne**: (born 1st 4, at Frank-  
lin, N. Y., June 2, 1853). He graduated at Yale 1873, and  
at the Harvard Law School and practiced law at Bos-  
ton until the outbreak of the civil war, when he became  
a correspondent for *The New York Tribune*, becoming a  
member of the editorial staff in 1865. In 1866 he reported  
for the *Tribune* the Austro-Prussian war. In 1867 he took  
up his abode in London, and his letters formed a familiar  
and popular feature of the *Trinbune's* foreign correspondence  
until 1885, when he became correspondent for the *London*  
*Times* in the U. S. H. A. WOOD.

**Smalley, James D. D.** (baptized) b. at Lebanon, New Hampshire, June 1, 1831; graduated at Yale College, 1853; was ordained minister of the Congregational Church at South Wethersfield, Conn., 1858. D. at New Britain, June 1, 1890. He was a prominent teacher of theology and a noted member of the New England school. He published several original and serious; among them, those on *Natural and Revealed Theology* (1890). Buried at N. P. Fiske.

**Small fruits**—a term applied in the U. S. to the strawberry and various fruits which grow upon bushes, as raspberries, blackberries, gooseberries, and currants. (Synonyms: *strawberries*, the term corresponds with bush-fruits, and *the berry*. Araspberries, mulberries, and gooseberries, are among terms improperly classed with the small fruits.

*Smilax* [from *smilax*, prostratus], or *Vario-la* Moel, Lat., name of that ancient, untamed, disordered; is a specific, common, climbing, forest, characterized by the development of leaves, flowers, and prostrates, and the formation of numerous pitated seeds. *Smilax* was unknown to the early Greek writers on medicine, but is mentioned in the oldest books of herbs, the *Varia*. The *Varia* describes accumulation upon the invasion of the *smilax* prostrates as producing a cold form of the disease, and thereby preventing its occurrence in the dangerous natural form. The first scientific description of *smilax* is that by an Arabian on local nature of the ninth century—*Itineris*. *Smilax* was known in Europe in the thirteenth century, and in the sixteenth century was carried by the Spaniards to America. It was first scientifically described, and its treatment admirably described, by Macdonald and Morton in England in the seventeenth and eighteenth centuries.

The combination of snailpox are general illness, yellow paces in the back and head high temperature followed by loss in four days from the cause by an eruption of snailpox pustules which in about four days were become pustules and then pustules. The pustules may have down

into ulcers, which destroy the entire thickness of the skin, and their healed scars, pits of various sizes, often being more or less distorted, and which give an appearance the equal to that of leprosy. There are two forms of smallpox, which are not only distinct in appearance but quite different in course. The first is called the discrete form, the second the confluent form. In discrete smallpox the pustules are separate and distinct; in confluent smallpox the pustules run together, and form larger and more serious ulcers than are found in the discrete form. Confluent smallpox is of a very severe type, or perhaps it would be better to say that severe attacks of smallpox are likely to have confluent lesions of the skin. The general symptoms of smallpox are a sense of illness, often a chill, elevation of temperature, eruptions of papules, a moderate fall of temperature, the development of pustules accompanied by a second rise of temperature, after which the symptoms expand upon the progress of the disease toward death or recovery.

The papules of smallpox usually appear first on the face, and especially on the chin, and afterward on the neck and chest; later on the arms and the extremities. The eruption occurs not only on the skin, but also on the mucous membranes of the respiratory and digestive apparatus, viz.: It is found in the nose, in the throat, in the larynx, and elsewhere, showing symptoms dependent upon the situation and severity of the local conditions. Eruption often occurs in smallpox, and especially in that severe form called hemorrhagic or "black" smallpox, when it is very much like what is known as spotted fever, measles, and scarlatina. Like all contagious diseases, smallpox has what is called a period of incubation, following the time of exposure to the contagium and preceding the time in which there are recognizable conditions of the disease. The length of this period is variously estimated at from seven to twenty-one days. Smallpox is both contagious and infectious; that is, it may be derived from direct association with a person having the disease, or be conveyed with articles which have been used by a person suffering with smallpox. The disease has appeared after articles used by the sick have been handled, even after these articles had been treated to a long duration, and after a long time had elapsed. The nature of the smallpox contagium is absolutely unknown, no disease seems peculiar to smallpox has ever been discovered, although it has been most diligently sought after. Apparently the disease is contagious in all its stages, and it is undoubtedly the most possible virus which is capable of being transmitted by the air may give rise to it; unknown children have developed the disease, showing that it is transmissible through the air of a mother. Previous to the introduction of processes of Vaccination, great smallpox was one of the most dreaded of diseases, and in Europe millions of persons lost their lives from its ravages. Since the general use of vaccination, and probably partly on account of advancing intelligence and improved hygienic conditions, nearly all classes of society, the ravages of smallpox have diminished to such an extent that only at large intervals and in a localized form

it appear in the form of an epidemic. The treatment of smallpox is principally what is called symptomatic, that is, addressed to the individual conditions incident to the disease. Violent medication has been entirely abandoned. The patient is isolated, given digestible food, plenty of water, and cool and antiseptic applications are made to the skin.

CHARLES W. DULLES.

**Smallwood, WILLIAM:** soldier; b. in Kent co., Md., about 1732; raised a battalion of Marylanders 1776, which he commanded as colonel, and half of which perished in the battle of Long Island under another commander; was engaged in the battle of White Plains; was appointed brigadier-general Oct. 23, 1776; accompanied Gen. Sullivan in the Staten Island expedition 1777; raised a new battalion of militiamen from the Western Shore of Maryland, and led it at the battle of Germantown; was made major-general Sept. 15, 1780; was with Gates in his Southern campaign, but left after the defeat at Camden, refusing to serve under Steuben; was member of Congress 1785, and Governor of Maryland 1785-88. D. in Maryland, Feb. 14, 1792.

**Smalt:** See COBALT.

**Smart, BENJAMIN HUMPHREY:** grammarian and metaphysician; b. in England about 1785; was for more than fifty years from 1815 a successful teacher of elocution in London; was a voluminous writer upon grammar, logic, rhetoric, and metaphysics, in which last department he claimed to "assert, correct, and carry onward the philosophy of Locke." Among his works were *A Grammar of English Pronunciation* (1810); *Rudiments of English Grammar Elucidated* (1811); *A Grammar of English Sounds* (1813); *Practical Logic* (1829); *Accidence of Grammar, Principles of Grammar, Manual of Rhetoric and Logic, The Practice of Elocution, and Historico-Shakespearean Readings*, the five latter being issued as a complete series in 1858; *Outlines of Sematology* (1831), with a *Sequel* (1837) and an *Appendix* (1839), the three works being issued together as *The Beginnings of a New School of Metaphysics* (1839); *The Way out of Metaphysics* (1844); *The Metaphysicians, a Memoir of Franz Carvel, Brushmaker, and of Harold Fremdling, Esq.* (1857); *Thought and Language* (1855); and *An Introduction to Grammar on its True Basis* (1858). Smart also published in 1836 a *Pronouncing Dictionary*, based upon that of John Walker, issued an epitomized edition of the same in 1840, and an *Appendix* in 1846 (revised editions 1860), which figure among the authorities upon pronunciation most frequently cited in the later editions of Webster's and Worcester's dictionaries. D. about 1872.

Revised by B. I. WHEELER.

**Smart, CHRISTOPHER:** poet; b. at Shipbourne, Kent, England, Apr. 11, 1722; educated at Pembroke College, Cambridge, where he became a fellow 1745; settled in London as a writer, becoming intimate with Pope, Johnson, and Garrick; was noted for improvidence and a convivial disposition, which made him the inmate of an insane asylum and later of the king's bench prison for debtors, where he died May 18, 1770 or 1771. He translated the *Works of Horace* into English prose (2 vols., 1756), and into verse (1767); published *The Hiliad, an Epic Poem* (1753), being a satire on Sir John Hill, noted for his quarrels with Fielding and with the Royal Society, and *The Parables of Christ done into Verse* (1765); but his most remarkable production was the *Song to David*, written in a madhouse, published in 1763, and reprinted in full in Chambers's *Cyclopædia of English Literature*. See *With Christopher Smart*, in Browning's *Parleyings with Certain People of Importance*.

Revised by H. A. BEERS.

**Smart, HENRY:** organist and composer; b. in London, Oct. 26, 1813; after studying law took up music; in 1831 was organist of the parish church of Blackburn, and there composed his first important work, an anthem. In 1836 went to London, where he remained, playing, teaching, and composing. His works include an opera, *Bertha* (1855); cantatas, *The Bride of Dunkerron*, Birmingham festival, 1864; *King René's Daughter* (1871), *The Fisher Maidens*, both for female voices; and an oratorio, *Jacob*, Glasgow festival, 1873. D. July 6, 1879.

D. E. HERVEY.

**Smeaton, JOHN:** civil engineer; b. at Aunthorpe, near Leeds, England, May 28, 1724; invented in 1751 an instrument for measuring a ship's progress; made several valuable inventions in hydraulic machinery, for which he received the Copley medal (1759); was noted as the builder of the Eddystone lighthouse (1756-59), an account of the con-

struction of which he published (1791); constructed Ramsgate harbor (1749-74), the Forth and Clyde Canal, the Greenwich and Deptford water-works, and many other important improvements. D. at Aunthorpe, Oct. 28, 1792.

**Smeety'm'nuus:** a name compounded of the initials of the authors of a celebrated tract entitled *An Answer* (1641), written in reply to Bishop Hall's *Episcopacy by Divine Right Asserted* (1641). The names of its five writers are Stephen Marshall, Edmund Calamy, Thomas Young, Matthew Newcomen, and William Spurstowe.

**Smell, Organ of:** See HISTOLOGY (*Organs of Special Sense*).

**Smelt** [in allusion to the cucumber-like odor of the typical species]: a small salmoniform fish belonging to the genus *Osmerus*, or a related genus, of the family *Argentinidae*, and esteemed as food. These fishes have the teeth of the lower jaw stronger than those of the upper, and fang-like ones on the vomer and front of the tongue, and normally inhabit salt water. *Osmerus eperlanus* is the European species; *O. mordax*, the eastern North American, known also as frost-fish; *O. thaleichthys*, the California smelt. *Hypomesus pretiosus* is the surf-smelt of California and northward. The silver-sides (*Atherinidae*), structurally very unlike the *Argentinidae*, are also loosely called smelts, as the California *Atherinopsis californiensis*. Among other fishes locally and improperly known by the name are the cyprinoid *Ilybognathus regius*, the spawn-eater, and the Pacific tomcod.

**Smelting** [from M. Dutch *smelten*: O. H. Germ. *smelzen* (> Mod. Germ. *schmelzen*), melt; cf. Gr. *μείδω*, melt, but probably not akin to Eng. *melt*]: in the more extended use of the term the entire process of reducing metals from their ores by fusion; in a more limited sense those particular metallurgical processes in which an ore or a product of other operations, such as roasting, treatment with acids, etc., is finally reduced to pure metal or some intermediate product. The fusions are conducted in shaft-furnaces, reverberatory furnaces, or crucibles. Metals ready for use or sale may be produced from ores by a single smelting operation, as iron; or they may require a series of smeltings, alternated with roastings, as copper when made from sulphuretted ores. The smelting process may be simply reducing, or oxidizing and reducing, or may be designed to volatilize certain bodies, to oxidize others, and to reduce still others. (Charcoal, coke, and anthracite are the fuels generally used in shaft-furnaces and for heating crucibles, and bituminous coal and wood for reverberatory furnaces; but peat, gas obtained from different materials in special generators and peculiarly constructed fireplaces, natural gas, petroleum, and waste gases from furnaces are used.)

To remove earthy matters and foreign oxides, and to facilitate the collection of the reduced metals, slags are produced, and, according to the nature of the effect to be obtained and the substance to be removed by scorification, the charges are so constituted as to yield more or less acid or basic slags by judicious mixture of the ores treated or by addition of various fluxes. Sometimes it is desirable to liberate some sulphur to combine with the metals and form a *matte* or *regulus*, and then iron pyrites is added. The general products of smelting are slag and metal, or slag and *matte*, or sometimes all three at once. The slags may have to be subjected to a reducing smelting to obtain the metal retained in them, the metal to an oxidizing and scorifying smelting to purify it, and the *matte* to Bessemerizing, to an oxidizing smelting, or, after roasting, to a reducing and scorifying smelting, during which some metals are partly removed by volatilization, as antimony, arsenic, and zinc; others by oxidation and scorification, as iron, zinc, and tin, while the desired metal is obtained in a nearly pure state or as a concentrated *matte*.

Shaft-furnaces are mainly employed for reducing fusions with coke, charcoal, and anthracite, although by a proper construction, good management of fluxes, and preparation of the ores, etc., a partial oxidizing action can be produced. The fusion is almost invariably effected by the aid of a blast. Reverberatory furnaces, with wood, coal, natural or producer gas, or petroleum, are generally used for oxidation; a very effective reducing action can also be obtained in them by excluding the air and keeping the hearth full of reducing gases. In crucibles the results of smelting depend entirely on the nature of the charge, oxidation and scorification being produced by certain fluxes; reduction by adding carbonaceous matters; scorification alone by using a simple

Philosophy in the same institution. He resolved the science of morals into four parts, and accordingly discussed in his lectures, first, natural theology; second, ethics; third, justice with reference to specific rules and precepts; and fourth, political expediency as affecting the honor, power, and prosperity of the state. His lectures were delivered extemporaneously, and were, for both matter and style, very popular. His first published work was the *Theory of Moral Sentiments*, issued in 1759. It called forth a high encomium from Hume, and brought Smith at once a wide reputation. Incidentally, this publication led to his being selected, four years afterward, to accompany the young Duke of Buccleugh on his travels. He carefully improved the opportunity thus presented to become acquainted with the internal policy of other states, and to confer with distinguished economists on the Continent. He returned to England in 1766, and for ten years lived with his mother in partial retirement at Kirkcaldy. There he devoted himself to the earnest study of subjects which had occupied his attention for nearly twenty years. The result was given to the world in 1776 in his great work entitled *An Inquiry into the Nature and Sources of the Wealth of Nations*. Many principles laid down in that work were no doubt derived from the French economists, but the completeness of their compilation and the clearness with which they are set forth in this treatise fairly entitle Adam Smith to be regarded as the father of modern political economy. His book will continue to be, as it has been hitherto, a standard of reference. Smith's biographer thus defines the main feature of this work: "Its great object is to demonstrate that the most effectual plan for advancing a people to greatness is to maintain that order of things which nature has pointed out, by allowing every man, as long as he observes the rules of justice, to pursue his own interest in his own way, and to bring both his industry and his capital into the freest competition with those of his fellow citizens." After residing two years in London, he was appointed a commissioner of customs for Scotland, and removed to Edinburgh, where he spent the remainder of his life. In 1787 he was elected lord rector of the University of Glasgow. D. in Edinburgh, July 17, 1790. After his decease most of his manuscripts were destroyed, as he had directed, but a few were published in 1795 under the title *Essays on Philosophical Subjects*.  
Revised by J. MARK BALDWIN.

**Smith, ALEXANDER**: poet; b. at Kilmarnock, Scotland, Dec. 31, 1830; was pattern-designer for a lace-factory at Glasgow; published a volume of poems, *A Life Drama* (1853), which attracted great attention; was appointed secretary of the University of Edinburgh 1854; wrote *Sonnets of the War*, along with Sydney Dobell (1855); *City Poems* (1857); *Edwin of Deira* (1861); *Dreamthorp* (1863); and the prose works *A Summer in Skye* (1865); *Alfred Hagart's Household* (1866); and *Miss Oona McQuarrie* (1866). D. at Wardie, near Edinburgh, Jan. 5, 1867. Smith has been classed with Bailey, the author of *Festus*, and others of "the spasmodic school" satirized in Aytoun's *Firmilian*. A *Memoir* by P. P. Alexander was published along with a posthumous volume of miscellanies entitled *Last Leaves* (1868).  
Revised by H. A. BEERS.

**Smith, ANDREW JACKSON**: soldier; b. in Bucks co., Pa., Apr. 28, 1815; graduated at the U. S. Military Academy; appointed in the army a second lieutenant of the First Dragoons July, 1838, of which regiment he became major in May, 1861 (known as the First Cavalry Aug., 1861), and July, 1866, colonel of the Seventh Cavalry. Prior to 1861 he served almost continually with his regiment on the frontier. In Oct., 1861, he was commissioned colonel of the Second California Cavalry, and Mar. 17, 1862, a brigadier-general of volunteers. He was engaged in the assault of Chickasaw Bluffs (Dec. 27-29, 1862), and later in the assault and capture of Arkansas Post (Jan. 11, 1863). In command of a division of the Thirtieth Army-corps, he took part in the siege and assaults of Vicksburg and in the subsequent capture of Jackson, Miss. In the Red river campaign he commanded the force (composed of detachments of the Sixteenth and Seventeenth corps) which captured Fort De Russy, and was engaged in the battle of Pleasant Hill. Next ordered to Missouri, he aided in driving Price from that State, then was called to re-enforce Gen. Thomas at Nashville, and engaged in the battle of Nashville and pursuit of Hood's army. Recalled to Gen. Canby's command in Feb., 1865, he commanded the Sixteenth Corps in the reduction and capture of Mobile, Ala. In Jan., 1866, he was mustered out of the vol-

unteer service, and in May, 1869, resigned his commission in the regular army. The brevets of colonel, brigadier-general and major-general were bestowed on him for gallantry at Pleasant Hill, La., Tupelo, Miss., and Nashville, Tenn. He was reappointed colonel of cavalry Jan. 22, 1889, by act of Congress and placed on the retired list on same date.

**Smith, BUCKINGHAM**: bibliographer and historian; b. on Cumberland island, Ga., Oct. 31, 1810; graduated at the Cambridge Law School 1836; was elected to the territorial legislature at Florida; was secretary of legation at Mexico 1850-52, and at Madrid 1855-58; and subsequently settled in Florida, where he was a judge and a member of the State Senate. He made special and important researches in Mexican history and antiquities, Indian philology, and the early Spanish expeditions in North America. Besides aiding Bancroft, Sparks, and Parkman in their researches, he edited translations of the *Narrative of Cabeza de Vaca* (1851); *Letter of Hernando de Soto and Memoir of Hernando de Escalante Fontaneda* (1854); and translated, with copious notes, *Narratives of the Career of Hernando de Soto in the Conquest of Florida* (1868). In 1864 he published *An Inquiry into the Authenticity of Documents concerning a Discovery of North America claimed to have been made by Verrazano*. D. in New York, Jan. 5, 1871. A portion of his library was secured for the New York Historical Society.  
HERBERT H. SMITH.

**Smith, CHARLES EMORY, LL. D.**: journalist; b. at Mansfield, Conn., Feb. 18, 1842; graduated at Union College in 1861; became editor of the *Albany Express* in 1865, of the *Albany Journal* in 1870, and of the *Philadelphia Press* in 1880. He was president of the New York State Press Association in 1874, a delegate to the national Republican conventions of 1876 and 1888, and U. S. minister to Russia 1890-92.

**Smith, CHARLES FERGUSON**: soldier; b. in Philadelphia, Pa., Apr. 24, 1807; graduated at the U. S. Military Academy in 1825, entering the army as a lieutenant of artillery. From 1829 to 1842 he served at the Military Academy in various capacities. In the Mexican war, as captain of artillery, he served with distinction, and received the brevets of major, lieutenant-colonel, and colonel. Appointed lieutenant-colonel of the Tenth Infantry in 1855, he commanded the Red river expedition in 1856, engaged in the Utah expedition in 1857-61, for a time was in command of the department of Utah, and was in command of the city and department of Washington Apr. 10-28, 1861. On Aug. 31, 1861, he was appointed a brigadier-general of volunteers, and ordered to Kentucky. In September he became colonel of the Third Infantry. In the operations about Forts Henry and Donelson he acquired a high reputation. In the fight for the possession of the latter stronghold he led the division which had held the left of the investing lines of the Union army, and which stormed and captured all the high ground on the Confederate right, which commanded Fort Donelson. Gen. Smith was then selected to command the movement up the Tennessee, and on Mar. 21 was promoted to be major-general of volunteers. D. at Savannah, Tenn., Apr. 25, 1862.

**Smith, CHARLES FORSTER**: professor of Greek; b. in Abbeville co., S. C., June 30, 1852; educated at Wofford College, Harvard and Leipzig Universities; Ph. D., Leipzig, 1881; Professor of Greek and German, Wofford College, 1875-79; Assistant Professor Ancient Languages, Williams College, 1881-82; Professor of Modern Languages, Vanderbilt University, 1882-83; Professor of Greek, Vanderbilt University, 1883; Professor of Greek, University of Wisconsin, 1894; author of *Thucydides: Book III. and Book VII.* of College Series of Greek Authors; vice-president American Dialect Society 1891.

**Smith, Sir DONALD ALEXANDER, D. C. L.**: member of Canadian Parliament; b. in Morayshire, Scotland, in 1821, and educated there. He was for many years in the service of the Hudson Bay Company, and is resident governor and chief commissioner of that corporation in Canada; is president of the Bank of Montreal, and a director of the Canadian Pacific Railway. He was appointed a member of the Executive Council for the Northwest Territories in 1870; represented Winnipeg and St. John in the Manitoba Assembly 1871-74; Selkirk in Dominion Parliament 1871-78; and Montreal West in that body 1887-95. He was knighted in 1886 for his services in connection with the construction of the Canadian Pacific Railway.  
NEIL MACDONALD.

**Smith, EDMUND KIRBY**: soldier; b. at St. Augustine, Fla., May 15, 1824; graduated at the U. S. Military Acad-

1888; 7th ed. 1894; vol. ii., 1890; 3d ed. 1894); *The Preaching of the Old Testament to the Age* (London and New York, 1893); *The Historic Geography of the Holy Land* (London and New York, 1894); with Bartholomew, the Scottish cartographer, *Historical Atlas of the Holy Land* (1895); and many articles for reviews. C. K. HORT.

**Smith, GERRIT**: philanthropist; b. at Utica, N. Y., Mar. 6, 1797; son of Peter Smith, a proprietor of vast tracts of land in Central and Northern New York; graduated at Hamilton College 1818; took up his residence at Peterboro, Madison co., N. Y., devoting himself to the management of his great landed estate; became a member of and liberal contributor to the Colonization Society 1825, but withdrew from it 1835, when he connected himself with the American Anti-Slavery Society, of which he was thenceforth one of the leading members; was elected to Congress 1852, but resigned after a single session; was a liberal contributor to the Free-soil campaign in Kansas; gave pecuniary aid to John Brown 1859 when preparing the attack on Harper's Ferry, though, it is believed, without a knowledge of that project; was nominated for Governor of New York in 1840 and in 1858, at the latter time on a platform of abolition and prohibition; joined Horace Greeley in signing the bail-bond of Jefferson Davis 1867; wrote, printed, and distributed many pamphlets on slavery and other reforms; built a non-sectarian church at Peterboro, in which he sometimes preached. D. in New York, Dec. 28, 1874. Author of *Speeches in Congress* (1855); *Sermons and Speeches* (1861); *The Religion of Reason* (1864); *The Theologies* (1866); and *Nature the Base of a Free Theology* (1867). See his *Biography*, by Frothingham (New York, 1878).

**Smith, GOLDWIN, LL. D., D. C. L.**: author; b. at Reading, England, Aug. 13, 1823; educated at Eton and at Oxford, where he graduated in 1845, and became a fellow of University College in 1847; called to the bar in 1847, but never practiced law. In 1850 he was appointed by the Government assistant secretary of the royal commission on the state of Oxford University; was secretary of the second Oxford commission; a member of the popular education commission in 1858; Regius Professor of Modern History in Oxford University 1858-66, and Professor of English and Constitutional History in Cornell University 1868-71. He ably championed the cause of the U. S. Government during the civil war; visited the U. S. in 1864 to deliver a series of lectures, and was given the degree of LL. D. by Brown University. In 1871 he removed to Toronto, Canada; was for a time a member of the senate of Toronto University; edited *The Canadian Monthly* 1872-74, and subsequently founded *The Week* and *The Bystander*, the latter of which is not now published. Since his removal to Canada he has persistently advocated the annexation of that country to the U. S. In addition to numerous magazine articles he has published the following among other works: *Lectures on the Study of History* (1861); *Irish History and Irish Character* (1861); *The Empire* (1863); *Three English Statesmen* (1867); *Couper* (English Men of Letters Series, 1880); *A Trip to England* (1888); *Jane Austen* (Great Writers Series, 1890); *Canada and the Canadian Question* (1891); *The Moral Crusader, William Lloyd Garrison* (1892); *The United States: an Outline of Political History, 1492-1871* (1893); *Bay Leaves: Translations from the Latin Poets* (1893); and *Essays on Questions of the Day* (1894). N. M.

**Smith, GREEN CLAY**: soldier; b. at Richmond, Ky., July 2, 1830; served as a volunteer in the Mexican war, gaining the rank of lieutenant of cavalry; graduated at Transylvania University 1850, and at Lexington, Ky., Law School; became a lawyer at Covington; was a member of the Kentucky Legislature 1861, and a decided Union man; became colonel of the Fourth Kentucky (Union) Cavalry Mar., 1862, and brigadier-general of volunteers June, 1862; resigned Dec. 1, 1863; was a member of Congress 1863-66; a delegate to the Baltimore convention 1864; Governor of Montana Territory 1866-68; entered the Baptist ministry, being ordained in 1869. In 1876 he was the candidate of the Prohibitionists for the presidency.

**Smith, GUSTAVUS WOODSON**: soldier; b. in Scott co., Ky., Jan. 1, 1822; graduated from the U. S. Military Academy July 1, 1842; appointed to the Engineer Corps, and for two years engaged in the construction of fortifications at New London harbor; Assistant Professor of Engineering at West Point 1844-46; commanded the sappers, miners, and pontoniers during the siege of Vera Cruz and during the subsequent operations of the war with Mexico, receiving the

brevets of first lieutenant and captain for gallantry at Cerro Gordo and Contreras. He was principal Assistant Professor of Engineering at West Point 1849-54, when he resigned from the army. He was subsequently employed in the construction of various Government buildings and in the iron-works of Cooper & Hewitt at Trenton, N. J. In 1858 he became street commissioner of New York city; early in 1861 he entered the Confederate army, and in August was appointed a major-general. On May 31, 1862, Gen. Johnston having been severely wounded that day at Fair Oaks, Gen. Smith succeeded to the temporary command of the Army of Northern Virginia, and subsequently commanded at Petersburg, Va. In 1864-65 he was commander of the State forces of Georgia, and was captured at Macon, Ga., Apr. 20, 1865. From 1866 to 1870 he was in charge of the Southwest Iron Company's works at Chattanooga, Tenn., and from 1870 to 1876 was insurance commissioner of Kentucky. He is the author of many works on life-insurance, Confederate war-papers, and criticisms on Confederate battles and leaders.

**Smith, HANNAH**: author; b. at Wellington, Shropshire, England. Under the pseudonym of *Heba Stretton* she has been a prolific author of novels and stories, including *Jessica's First Prayer* (1866); *The Clives of Bureol* (1867); *Paul's Courtship* (1867); *Healer Morley's Promise* (1878); and *Bede's Charity* (1882). H. A. B.

**Smith, HENRY BOYNTON, D. D., LL. D.**: theologian; b. at Portland, Me., Nov. 21, 1815; graduated at Bowdoin College 1834; was a tutor there 1836-37, and again 1840-41, between which periods he studied theology at Andover, Bangor, Halle, and Berlin; was pastor of the Congregational church at West Amesbury, Mass., 1842-47; Professor of Mental and Moral Philosophy at Amherst College 1847-50; was Professor of Church History in Union Theological Seminary, New York, 1850-54, and of Systematic Theology 1854-74; after that professor emeritus; was moderator of the General Assembly of the (New School) Presbyterian Church 1863-64; delivered at the meeting of that body at Dayton, O., an address on *Christian Union and Ecclesiastical Reunion*, which was directed toward that union with the "Old School" Church which was afterward consummated, and for which he prepared an essay on the doctrinal basis, *The Reunion of the Presbyterian Churches* (1867); was appointed delegate in 1867 to the meeting of the Evangelical Alliance in Amsterdam, for which he prepared a report *On the State of Religion in the United States*; was the founder and editor of *The American Theological Review* (1859-71), consolidated with *The Presbyterian Review* in 1862, and united with *The Princeton Review* in 1872; and Prof. R. D. Hitchcock in the *Life, Character, and Writings of Edward Robinson* (1864). He published in 1859 a *History of the Church of Christ, in Chronological Tables* (followed by a translation in part, and editor, of Gieseler's *Church History* (4 vols., 1859-63; vol. v. published posthumously in 1880); editor of revised translations of Hagenbach's *History of Christian Doctrine* with large additions (2 vols., 1861-62), and Stier's *Words of the Lord Jesus* (1864-65). D. in New York, Feb. 7, 1877. In that same year his friend Dr. Prentiss edited a collection of his discourses and essays entitled *Faith and Philosophy*. In 1881 his *Memoirs* appeared, edited by his wife, and a briefer biography, by his pupil Prof. Lewis French Stearns, appeared in Boston, 1882. Another pupil, Prof. William S. Karr, of Hartford, edited his *Apologetics* (1882), his *Introduction to Christian Theology* (1883), and his *System of Christian Theology* (1884). Revised by S. M. JACKSON.

**Smith, Sir HENRY GEORGE WAKELYN**, usually known as Sir HARRY SMITH: soldier; b. at Whittlesea, Cambridgeshire, England, in 1788; entered the army as second lieutenant in the rifle-brigade in 1805; served as assistant quartermaster-general in the campaign of Waterloo; commanded a division in the Kaffir war 1834-35; was appointed adjutant-general to the forces in India 1839; was distinguished at the battles of Gwalior and Maharajpur, being knighted for the latter service 1844; took a prominent part in the war against the Sikhs in the Punjab; was sent to the relief of Ludhiana, and took Aliwal at the point of the bayonet Jan. 28, 1846, capturing sixty-seven guns; re-enforced Lord Gough in time to enable him to win the decisive battle of Sobraon, Feb. 10, 1846; received the thanks of Parliament on the proposal of the Duke of Wellington, and was made a baronet; became governor of the Cape of Good Hope 1847; conducted the Kaffir war of 1851-52, and was made lieutenant-general 1854. D. in London, Oct. 12, 1860.

**Smith, Hosea**, lawyer and journalist, b. at Laramie, Wyoming, U. S., Sept. 2, 1859; raised at H. R. Smith's farm near New Hampshire; grad. for several years as professor in the University of North Carolina; educated at the University of Chicago; went to Athens, 1882, to study law; also taught school at Washington, D. C., interested in the Great Atlantic City, discovered Smith into Georgia 1875, stopping the transport of the steam engine from North Carolina to Atlanta, engaged and secured president of the Atlanta Economic Development Board; made this paper very popular in the State through his editorial in the columns of a law office. In 1881 he became Secretary of the Interior.

**Smith, Thomas**, historian and poet; b. in London, England, Dec. 21, 1776; became a member of the Stock Exchange, in which business he acquired a fortune. Was associated with his brother James in working for several periods and in the production of a celebrated volume of poetical and prose miscellany, *Reveries Addressed* (1842); was author of many other works which had but moderate success, and of an extensive volume of humorous prose sketches *The Ten Commandments* (1854). A collection of his poems was published at London and N. Y. at Cambridge, Mass., July 13, 1840. A selection from his poetical works of both his brothers, including *The Ten Commandments* and accompanied by a *Memorandum*, was published by E. S. Sargent (New York, 1857).

Revised by H. A. Rogers.

**Smith, James**, signer of the Declaration of Independence, b. in Ireland about 1750; was taken to Pennsylvania as a captive, was sold in the Seneca nation 1759; was educated at the College of Philadelphia; became at first a journeyman tailor, then a shoemaker; afterwards a lawyer at York; joined in 1774 the first committee in the state for the purpose of resistance to Great Britain; was a member of the convention which considered the expediency of submitting to those importing English goods, and one of the members for proposing resolutions for the representatives; submitted an essay on the *Constitutional Power of Great Britain* and the *Colonization of America*, which gave a powerful impetus to the Revolution, was elected to the Continental Congress 1776-79; signed the Declaration of Independence; in 1781 was elected to the General Assembly of Pennsylvania; b. at York, July 11, 1806. He was a man of great wit and his odd gestures and drawing-room habits led to the effect of his odd speeches.

**Smith, John**, adventurer, b. at Willoughby, Lincolnshire, England, in June, 1570; spent four years of his early education in military service in the Netherlands; was afterwards according to his own account, engaged in wars against the Spaniards in Hungary and Transylvania, but there is reason to believe that his wonderful adventures in the East are more or less pure fiction. Returning to England, he was at the time of the capture of the ship, Bartholomew (1606), then being carried into effect, and brought to bear with such effect the matter upon the directors of the "London Company" that his name was placed on the score list of certain persons appointed members of the council. During the long voyage to Virginia (1607) Smith was placed under arrest on an accusation of sedition, and, though his name was carried as a member of the council, he was excluded from his place in the council. He accompanied Capt. Newport in his voyage of exploration up James river as far as the present site of Richmond; was on that return admitted as a member of the council; took part in the disorders which resulted in the removal from office of Wingfield, the president of the colony, against whom he successfully brought a suit for slander; was intrusted with the command of several expeditions into the country, partly for the purpose of exploration but chiefly with the object of obtaining food. He repressed with severity the protests of some of the settlers to return to England upon which charge he caused Capt. George Kendall to be imprisoned and executed. Upon one of these expeditions in Dec. 1607, Smith was taken prisoner and detained for some time though kindly treated by the Indian chiefdom. When released he immediately called for many writers the "captivity" of the Indians. The famous account of the preservation of his life as a prisoner for a month was published in 1608 but there is little doubt that the whole account is fiction. On being carried back to Jamestown by the Indian chiefdom, Smith was tried by his fellow settlers for the death of one of his companions, and he was then killed by the Indians through his imprudence.

and was imprisoned in the prison the next day, but his life was saved by the opportune arrival of Capt. Newport with reinforcements and provisions. In the following year Smith made two celebrated voyages of exploration to the tributary waters of which he made a map, becoming president of the council, 1609, and second vice-president. With hostile Indians who at one time prohibited the destruction of Jamestown. His departure from Virginia to which he never returned, took place in Sept., 1609, and was attributed by himself as his leaving being forced by an explosion of gunpowder, but another account states that he was sent to England a prisoner. In 1614 he explored with two ships (fired out by some London merchants) a large portion of the North American coast, to which he gave the name of New England, and of which he formed a colony security map, and made a harmonious peace by forcing and convincing. In 1615 he and three other voyagers to New England for the purpose of founding a colony, but was captured by a French man-of-war and taken to Quebec. Afterward he came to have been engaged in "war" for the French against the Spaniards, and to have experienced several remarkable adventures. About 1620 he received the title of governor of New England and was almost entirely engaged in promoting American colonization by means of a series of publications in America, written either by or for him in which numerous volumes of his career in many lands were put forth; but many of the details are contradicted by contemporary records, and his several books and pamphlets are not consistent with one another upon some important points. It is to London, June 21, 1631, and was buried in the church of St. Sepulchre's church. Under the name of Thomas Watson Smith and from Virginia, *A True Relation of such Discoveries and Accidents at Sea as hath happened in Virginia, etc.* (London, 1606), which was printed in whole later, accompanied by a map, and is the earliest tract published on the subject. It was reprinted with an introduction and notes, by Charles Deane (Boston, 1897). He was also author of *A Map of Virginia with a Description of the Country, the Commodities, the People, Government, and Religion, etc.* (London, 1607); *A Description of New England, or the Discoveries and Discoveries of Captain John Smith (Admiral of that Country) in the North of America in the Year of our Lord 1614, etc.* (London, 1616); reprinted in vol. vi, 3d series of the *Collections of the Massachusetts Historical Society*, and in *Smith's Travels: New England's People, etc.* (1626 and 1627); *The True Travels, Adventures and Discoveries of Captain John Smith in Europe, Asia, Africa, and America from 1606 to 1631, etc.* (1631), and *Advertisements for the Increase and Planting of New England, etc.* (1624), reprinted at Boston, 1855), and was engaged at the time of his death upon a *History of the Sea*, the parts of which have been preserved. The *General History and True Travels* were republished together at Richmond (2 vols., 1826). A *Letter of John Smith to Lord Bacon*, written in 1618 for recommendation to the Chancellor's attention the *Colonies of New England*, was first printed in the *New York Historical Manuscripts* for 1861. There are biographies by George S. Hallard in Sparks's Series, vol. 8A, W. G. Sumner (1846), and George C. Hall (1859). Much light was thrown upon his career by the Hakluyt Society's publication of Strachey's *History of Travels into Virginia Britannia* (1849) from the original MS., and by Charles Deane's notes to his edition of Wingfield's *Discoveries of Virginia* (Boston, 1859), in which publications the fabric of the Pocahontas legend was first exposed. In Bryant and May's *Popular History of the United States* (vol. 1, 1870), judicious use has been made of the materials above mentioned.

Revised by C. K. Adams.

**Smith, John Lawrence, M. D., M. S., A. S.**, born at Union, Charleston, S. C., Dec. 17, 1819; graduated at the University of Virginia, and at the Medical College of the State of South Carolina (1840); acted as civil engineer on the Charleston and Cincinnati Railroad; pursued his professional studies in France and Germany; began in 1844 the creation of medicine at Charleston, S. C., where he delivered lectures on pathology, among others (1846-47) to the Turkish Government; visited in the development of cotton-growing in Asia Minor; was instrumental in the discovery of deposits of emeralds and opals in the U. S.; invented in 1850 the inverted microscope; was elected in that year

Professor of Chemistry in the University of Virginia; removed to Louisville, Ky.; became a professor in the Medical University of that city; was U. S. commissioner to the Universal Exposition of Paris (1867), Vienna (1873), and Philadelphia (1876); was in 1872 president of the American Association for the Advancement of Science; was a member of the National Academy of Science and of numerous associations; received from the Emperor Napoleon III. the cross of the Legion of Honor; was author of a report to the U. S. Government on *The Progress and Condition of Several Departments of Industrial Chemistry* (1867), as seen at the Paris Exposition, and *Mineralogy and Chemistry* (Louisville, 1873). D. in Louisville, Ky., Oct. 12, 1883.

**Smith, JOHN PYE**: clergyman and author; b. at Sheffield, England, May 25, 1774; studied at the Independent Academy at Rotherham; became a Dissenting (Independent) minister, and in 1800 resident classical tutor in the theological academy at Homerton; exchanged that post in 1813 for the divinity tutorship, which he filled until 1843; was again classical tutor, and also principal, from the latter date until 1850. For forty-three years he was pastor of the Gravel Pits Chapel, Homerton; took great interest in science, and was elected a fellow of the Royal Society. D. at Guildford, Surrey, Feb. 5, 1851. He was the author of *The Scripture Testimony to the Messiah* (2 vols., 1818-21); *The Mosaic Account of the Creation and Deluge illustrated by the Discoveries of Modern Science* (1837); *Scripture and Geology* (1839); and other works. See *Memoirs of the Life and Writings of John Pye Smith*, by J. Medway, 1853.

**Smith, JOHN WILLIAM**: legal writer; b. in London, England, Jan. 2, 1809; educated at Trinity College, Dublin; began practice as a special pleader 1831, and was called to the bar at the Inner Temple May 8, 1834; was made a revising barrister in 1840. He was gifted with a remarkable memory, and powers of nice discrimination and lucid exposition. D. in London, Dec. 17, 1845. Besides a *Compendium of Mercantile Law* (1834) and *A Selection of Leading Cases in Various Branches of the Law* (2 vols., 1837-40; 9th ed. 1889), which are of the highest authority, he wrote *An Elementary View of the Proceedings in an Action at Law, Law of Landlord and Tenant*, and other less important works. See *Memoirs in Blackwood's Magazine* (Feb., 1847), *Law Magazine* (Feb., 1846), and *Albany Law Journal* (Dec., 1872).

F. STURGES ALLEN.

**Smith, JOSEPH, JR.**: Mormon prophet; b. at Sharon, Vt., Dec. 23, 1805; removed while a child, with his parents, to Palmyra, N. Y., where he grew up almost without education, leading an idle and rather disreputable life. According to his own account, he began to have visions at the age of fifteen, and on Sept. 21, 1823, the angel Moroni appeared to him, announcing that God had a work for him to perform, and that buried in the earth in a certain spot a few miles distant was a record inscribed upon gold plates, giving an account of the early inhabitants of America and of their fate; and with this record would be found a kind of spectacles through which alone the writing could be read. Four years after, the angel placed the plates in his hands, together with the spectacles. Smith described the plates as being about 8 inches long, 7 wide, and connected by rings so as to form a volume about 6 inches thick. The plates were inscribed on both sides with hieroglyphic characters in a language no longer extant, but which he was able to decipher and understand by the use of the miraculous spectacles, which he called the Urim and Thummim. Smith professed to have dictated in English the contents of these plates to Oliver Cowdery, who acted as his amanuensis, the plates themselves mysteriously disappearing as they were successively transcribed. The manuscript thus prepared was printed at Palmyra in 1830 under the title, *The Book of Mormon, an Account written by the Hand of Moroni upon Plates taken from the Plates of Nephi. By Joseph Smith, Jr., Author and Proprietor*; and to it was prefixed a certificate signed by Cowdery and two others to the effect that they had seen and handled the plates. Subsequently, all three of the witnesses fell out with Smith, and declared the whole matter to be a hoax. Smith was soon joined by Sidney Rigdon, a printer by trade, who had also aspired to found a new religion, and the two gained a small body of followers, and in 1831 went to Kirtland, O., where they built a temple and set up a fraudulent bank. They were driven away by the citizens in 1838. Smith had in the meantime fixed upon a place in Missouri as the site of his New Jerusalem, and here his adherents had begun to gather; but becoming obnoxious to

the surrounding inhabitants, they abandoned their settlement, and took refuge in Hancock co., Ill., where in 1840 they established themselves in a fine location at the bend of the Mississippi, calling their new home Nauvoo; the town increased so rapidly that in six years the population numbered 15,000. Here Smith soon began to put forth, as occasion demanded, a succession of new revelations, among others one establishing polygamy as an essential feature of the Church of the Latter-Day Saints, and combining in his own person all civil, military, municipal, and sacerdotal authority. A newspaper was set up to oppose him; the presses were destroyed by Smith and his adherents May 6, 1844; warrants were issued for his arrest and that of his brother Hyrum and some others; they refused to obey the writs; the State militia were called out; the Mormons armed themselves, and a conflict was imminent. The Governor of Illinois at length induced the Smiths to surrender and submit to trial, guarantying their personal safety in the interval. They were committed to jail at Carthage, the county-town, and a guard was placed for their protection. On the evening of May 27 a mob assembled, dispersed the guard, and began firing into the door and window of the jail. Hyrum Smith was shot dead; Joseph returned the fire with a revolver until his charges were exhausted, when he endeavored to make his escape by the window, but was shot in the attempt, and fell dead to the ground. See *Mormons*.

Revised by S. M. JACKSON.

**Smith, JOSHUA TOULMIN**: author; b. in Birmingham, England, May 20, 1816; educated in the public schools of Birmingham; devoted himself to the Scandinavian languages and literature, in which he became proficient; resided in the U. S. 1837-42; published at Boston his *Northmen in New England, or America in the Tenth Century* (1839), which was chiefly a translation from the *Antiquitates Americane* (1837); devoted himself, on his return to England, to the study of constitutional and Old Saxon law; was called to the bar 1849; wrote several able legal treatises, especially *The Parish, its Obligations and Powers, its Officers and their Duties* (1854); illustrated in several publications the antiquities of Birmingham, and undertook the preparation for the Early English Text Society of a *History of English Guilds*, a work of immense labor, which, as well as a projected *History of Birmingham*, was left incomplete at the time of his death, which occurred at Lancing, Sussex, Apr. 28, 1869. The *History of English Guilds*, edited by his daughter, Lucy Toulmin Smith, appeared in 1870.

**Smith, JUDSON, D. D.**: clergyman; b. at Middlefield, Mass., June 28, 1837, graduated at Amherst College 1859, and at the Oberlin Theological Seminary 1863. He was Professor of Latin in Oberlin College 1866-70, and of Ecclesiastical History in Oberlin Theological Seminary 1875-84. In 1884 he was made a secretary of the A. B. C. F. M., Boston, Mass. He is the author of two volumes of historical lectures (privately printed) and of various articles in reviews and other journals, and since 1882 has been one of the editors of the *Bibliotheca Sacra*.

G. P. FISHER.

**Smith, MUNROE, J. U. D.**: professor of Roman law; b. in Brooklyn, N. Y., Dec. 8, 1854; A. B., Amherst, 1874; LL. B., Columbia, 1877; studied at Berlin, Leipzig, and Göttingen Universities 1877-80 (J. U. D., Göttingen); lecturer on Roman Law, Columbia College, 1880-91; Professor of Roman Law and Comparative Jurisprudence since 1891; instructor in history 1880-83; Adjunct Professor of History 1883-91; contributor to *Johnson's Universal Cyclopædia*, *The Nation*, etc., and managing editor *Political Science Quarterly* 1886-93.

C. H. THURBER.

**Smith, NATHAN RYNO, M. D., LL. D.**: surgeon; b. at Cornish, N. H., May 21, 1797; graduated at Yale College 1817; took the degree of M. D. at New Haven 1823; was Professor of Anatomy and Surgery in the University of Vermont in 1825; on the organization of the Jefferson Medical College in Philadelphia, became the Professor of Anatomy, but in 1827 accepted the chair of Surgery in the University of Maryland; in 1838 became Professor of Practical Medicine in the Transylvania University, Lexington, Ky.; in 1849 returned to the University of Maryland; invented a method of lithotomy, an excellent suspensory apparatus for fractured inferior extremities, and wrote *Surgical Anatomy of the Arteries* (1832) and other medical works. D. in Baltimore, Md., July 3, 1877.

Revised by S. T. ARMSTRONG.

**Smith, RICHARD SOMERS**: soldier and educator; b. in Philadelphia, Pa., Oct. 30, 1813; graduated at the U. S.

Mathematical Academy July 4, 1824, assigned to the Second Infantry, 2d General Regiment but turned on topographical engineering in 1826, when he was assigned to follow the regular army into engineering. In 1830 he was reappointed to the same, with rank of second lieutenant of infantry, first lieutenant in 1836, transferred to the Fourth Artillery 1838, he was Assistant Professor of Drawing at the Military Academy in 1838, resigned from the army and was Professor of Mathematics and Drawing at the Brazilian Polytechnic Institute, which position he retained until 1842. From 1842 to 1848 he was a director of the Chamber of Commerce of Rio de Janeiro, he re-entered the army, with rank of major and was assigned to the 2d Infantry, he served on mounting and dismounting duty until the latter part of 1849, when he rejoined his regiment, and was assigned to the 1st Infantry of Cavalry in May 2-4, 1850. Soon after, in May 24, he accomplished his commission lieutenant, and proceeded to record college, Philadelphia, and held that position until 1853. He was Professor of Civil Engineering in the Polytechnic College of the same of Philadelphia (1854-70), Professor of Mathematics (1870-75), and 1875-77 was the head of the department of Drawing at the U. S. Naval Academy at Annapolis. In 1857 a civilian college was opened upon the grounds of A. M. He was the author of *A History of Topographical Engineering* (Philadelphia, 1854) and *Manual of Linear Perspective* (1857). D. at Annapolis, Md., Jan. 20, 1891.

**Smith, Brewster, Mary, Ph. D.; economist; b.** at Troy, N. Y., Feb. 9, 1864; A. B., Amherst College, 1875; studied at the University of Berlin and Heidelberg 1875-77; assistant in physics, University of Chicago, 1877-78; adjunct professor 1877-80; Professor of Political Economy and Social Science, Columbia College, since 1882; member of the National Academy of Sciences; honorary fellow Royal Statistical Society; member of the International Statistical Institute; author of *Production and Consumption* (1885); *Religion and Immigration* (1886); and numerous magazine articles.

**Smith, Henry; mathematician; b.** in England in 1780; made over to the Church of England; succeeded his cousin and friend, George George as Professor of Astronomy at Cambridge 1810, edited Cambridgeshire with commentaries; published *A Complete System of Optics* (2 vols., 1786) and *Navigation, or the Philosophy of Marine Science* (1790), and succeeded Bentley as reader of Trinity College 1792. D. at Cambridge, Aug. 1798. He has with him at 1800 to Trinity College and 1810 to the university for the support of the astronomical professorship and the maintenance of two annual prizes called the Smith prizes for proficiency in mathematics and natural philosophy.

**Smith, Henry; brother of the Samuel Smith; b.** at Norwalk, Pa., Nov. 1797; served as a volunteer at Brandywine; graduated at Princeton 1794; studied law, which he practiced with distinction at Baltimore; was for some years a member of the Maryland Legislature; was Secretary of the Navy in the cabinet of President Jefferson 1802-05; Attorney General Mar. Dec. 1805; and Secretary of State under President Madison 1806-11; was for several years president of the American Bible Society and of the Maryland Association Society, and professor of the University of Maryland 1811. A. at Baltimore, Nov. 20, 1832.

**Smith, Henry; DANWELL; See DREW.**

**Smith, Henry Payne, D. D.; clergyman and author; b.** at Salisbury, Wiltshire, England, Nov. 1818; graduated with honors at Oxford 1844; took orders in the Church of England; became a librarian of the Bodleian Library, Oxford, 1847; member of the Church and Regius Professor of Theology, Oxford, 1855; Dean of Chester, by succession in 1865; and 1871. He published the *Latin Catalogue of the MSS. in this library*; edited and translated from the Syriac the *Commentary of Cyril of Alexandria on Luke*, which is translated from the same language the *Evangelical Commentary of John of Ephesus* (1866) commenced in 1868; the *History of the Christian Church from a Syriac Version*, by a monk of the Church of Antioch (1865); is author of *The Commentary and Homilies Interpreted at the English Church* (London, 1865); is a church of Synodical prebendary in the University of Oxford (1892); Prebendary of Prebendary for a short time, being the Regius Professor for the same; *Exposition of the Historical Doctrine of the Resurrection of Christ* (1887); and the commentary on Jeremiah in the series known as *The Speaker's Commentary*, on

Isaiah in the *Commentary of the Society for the Promotion of Christian Knowledge*, in London; *The Subject Commentary*, and an edition of *Isaiah*, *Editor's Commentary*. He visited the U. S. as a delegate to the general conference of the Evangelical Alliance in 1844, 1853. He was a member of the Old Testament revision company.

Revised by S. M. JENNINGS.

**Smith, Samuel; soldier; b.** at Lancaster, Pa., July 27, 1752; removed to Middleburg, Pa., was a son-in-law by his father's marriage having become a captain in Smith, wife's Maryland regiment Jan. 1776; took part in the battles of Long Island, Red Bank, and White Plains, and in the retreat through New Jersey; landed upon the French bastion Dec. 19, 1776, and fought at Germantown 1777; spent the winter on Staten Island and at the battle of Red Bank; was placed in Washington's command of Fort Mifflin, which he gallantly defended from Sept. 20 to Nov. 21, when he was severely wounded and forced to remove to the Jersey shore, received the thanks of Congress and was discharged; was at Valley Forge and at the battle of Monmouth, after which he resigned his commission in the army, but continued to serve as colonel of militia, and a member of the Maryland constitutional convention 1776, member of Congress 1793, 1800 and 1805-22, U. S. Senator 1801-15, and again 1822-43, serving throughout the time as chairman of the Finance committee, and occasionally as president pro tempore of the Senate, was largely instrumental in leading at the defense of Baltimore against the British, 1814; quitted a formidable role in 1815; and was afterwards elected mayor. D. in Baltimore, Apr. 23, 1839.

**Smith, Samuel, Francis, D. D.; author and editor; b.** at Boston, Mass., Oct. 31, 1808; graduated at Harvard 1828; studied theology at Andover Seminary; became a Baptist clergyman 1832; edited *The Baptist Missionary Magazine* at Boston 1832-33; was a prominent contributor to *Trinitarian Evangelical Association*, was pastor of a church at Waterville, Me., and Professor of Western Language in Waterville College 1834-42; pastor at Keosauqua, Iowa, 1842-54; edited *The Christianian Review* 1849-50 and for many years was editor of the publications of the Baptist Missionary Union. He published with Rev. Bacon Shaw *The Testament* (1846); edited a volume of *Latter Times* (1844); wrote a *Life of Rev. Joseph Trafton* (1846); and is author of many well-known tracts and tracts, including *My Country, 'Tis of Thee* and *The Morning Light is Breaking*. On April 3, 1865, he was given a very enthusiastic reception in Music Hall, Boston, and in many parts of the country the published children observed the day by singing his famous song.

Revised by W. H. WATSON.

**Smith, Samuel, Stashoff, D. D., LL. D.; educator; son of Rev. Dr. Robert Smith 1723-90, b.** at Piquette, Pa., May 18, 1756; graduated at Princeton 1780; was educated at, and became a teacher in, his father's classical academy, pursuing meanwhile the study of theology; was later at Princeton 1778-79; was ordained to the Presbyterian ministry 1774; labored as a missionary in Western Virginia; was the first president of Hanover College 1774-79, became Professor of Moral Philosophy at Princeton 1779, also Professor of Theology 1781; was president of the college 1789, and president 1816; was a member of the committee appointed to draw up a system of government for the Presbyterian Church 1789; was an eloquent and fervent puritan, and distinguished for worthy manners; published *An Examination of the Causes of the Variety of Opinions and Parties in the Human Species* (Philadelphia, 1787); *Sermons* (Newark, N. J., 1790); *Lectures on the Principles of the Christian Religion* (Philadelphia, 1800); *Lectures on Moral and Political Philosophy* (2 vols., Trenton, N. J., 1812); and *Constitutions of the United States and General Religion* (New Brunswick, N. J., 1815); completed the *History of the United States* (Philadelphia, 1816-17), begun by his father-in-law, Dr. David Hume. And published a number of separate sermons and discourses. He married a daughter of his predecessor, Dr. Witherspoon; resigned the presidency in 1810; of 1811 Smith 1812. D. at Princeton, Aug. 23, 1819. Two volumes of his *Sermons* are published posthumously in Philadelphia, 1821, preceded by a brief notice.

Revised by S. M. JENNINGS.

**Smith, Saml; journalist and historian; b.** at Rock Hill, Me., Sept. 14, 1792; graduated at Bowdoin College 1810; became a journalist at Portland, editing successively the *Argus*, *Portland Reporter*, and *Daily Courier*; married Mary Elizabeth Davis, Prince 1823; won a wide reputation as a

humorist by his *Letters of Major Jack Downing* (1833); lost his property 1839; settled in New York 1842; devoted himself successfully to literature, as did also his wife (see SMITH, ELIZABETH OAKES); published *Dewdrops of the Nineteenth Century* (1846); *My Thirty Years out of the Senate* (1859); *Powhatan, a Metrical Romance* (1841); *New Elements of Geometry* (1850); and *Way Down East, or Portraits of Yankee Life* (1855); besides a vast number of uncollected verse and prose essays which appeared in various periodicals. D. at Patchogue, L. I., July 29, 1868.

Revised by H. A. BEERS.

**Smith, SYDNEY:** clergyman and author; b. at Woodford, Essex, England, June 3, 1771; was educated at Oxford, where in 1792 he became a fellow of New College; resided a few months in Normandy, where he mastered the French language, and in 1794 became curate of a lonely parish on Salisbury Plain. In 1796 he went to Edinburgh, where he remained five years, officiating in an Episcopal chapel; became intimate with Brougham, Jeffrey, and other brilliant young men, who in 1802 started *The Edinburgh Review*, Smith acting as original editor and contributing seven articles to the first number. Soon after this he went to London, where he became a popular preacher, and in 1804-06 delivered courses of lectures on moral philosophy, contributing also to *The Edinburgh Review* until 1827. In 1806 he was presented with the living of Foston-le-Clay, in Yorkshire, worth £500 a year, but situated in a desolate region. In 1809 he went to Heslington, near York, leaving Foston in charge of a curate, hoping to exchange it for a more desirable benefice. Not succeeding in this, he returned in 1814, built a comfortable rectory, in which he lived until 1828, when the chancellor, Lord Lyndhurst, appointed him canon of Bristol, and gave him the rectory of Combe-Florey. In 1831 he was made resident canon of St. Paul's, upon which he took up his abode in London, where he passed the remainder of his life in the discharge of his official duties, in literary labor, and in the pleasures of society, in which he was a great favorite for his wit and rare conversational powers. D. in London, Feb. 22, 1845. Among his most characteristic productions are his *Letters on the Subject of the Catholics, to my brother Abraham, who lives in the Country*, by Peter Plymley (1807-08; published anonymously), which had a large share in bringing about Roman Catholic emancipation. He published several volumes of sermons, many occasional discourses, and political and social essays. His early lectures on moral philosophy were edited by Francis Jeffrey, and published under the title *Elementary Sketches of Moral Philosophy* (1849). Several volumes of selections from his various works have appeared, the best of which is *Wit and Wisdom of Rev. Sydney Smith*, accompanied by a biographical sketch and notes, by Evert A. Duyckinck (1856). His memoirs have been written by his daughter, the wife of Sir Henry Holland (1855). Also see *Life and Times of Sydney Smith* (London, 1884), by Stuart J. Reid.

Revised by H. A. BEERS.

**Smith, WILLIAM:** geologist; b. at Churchill, Oxfordshire, England, Mar. 23, 1769; in the practice of his profession as mineral surveyor was led to notice and make maps of the succession of geological strata; he published a *Tabular View of the Order of the Strata, and their Imbedded Organic Remains, in the Neighborhood of Bath* (1799); *Mineral Survey, or Delineations of the Strata of England and Wales* (1815, with sixteen colored maps); *Strata identified by Organized Fossils* (1816-19); *Stratigraphical System of Organized Fossils* (1817); issued between 1819 and 1824 no less than twenty-one colored geological maps of English counties; delivered lectures in most of the provincial towns of England; superintended the model farm of Sir John V. B. Johnstone at Hackness, Yorkshire, 1828-34; received from the Geological Society of London the first Wollaston medal for his important discoveries, and in his later years received a pension of £100 a year. He discovered and was first to apply the principle of the classification and correlation of formations by means of their contained fossils, and has hence been called "the father of English geology." D. at Northampton, Aug. 28, 1839.

Revised by G. K. GILBERT.

**Smith, Sir WILLIAM:** editor and author; b. in London, England, May 20, 1813; graduated in London University; studied law at Gray's Inn, but never practiced; was for some years Professor of Greek, Latin, and German in the Independent colleges of Highbury and Homerton, and on their consolidation as New College, St. John's Wood, accepted the professorship of the Greek and Latin Languages

and Literature; became classical examiner in the University of London 1858, and editor of *The Quarterly Review* 1867; knighted in 1892. He is widely known by his excellent series of classical dictionaries, having published those upon *Greek and Roman Antiquities* (1840; 2d ed., enlarged and revised, 2 vols., 1891), *Biography and Mythology* (1849), and *Geography* (1852-57), as well as by his *Dictionary of the Bible* (1860-63) and *Dictionary of Christian Antiquities*. He prepared numerous classical schoolbooks, an *English-Latin Dictionary* (1870), a *Biblical and Classical Atlas* (1875), and a series of *Students' Manuals* of ancient and modern history, etc. He was knighted in 1892. D. Oct. 7, 1893.

Revised by A. GUDEMAN.

**Smith, WILLIAM ANDREW, D. D.:** preacher and educator; b. at Fredericksburg, Va., Nov. 29, 1802; became a preacher of the Methodist Episcopal Church South; in 1846 became president of Randolph-Macon College; in 1866 resigned, and after serving as pastor two years became president of Central College; was a leading member of every General Conference from 1832 to 1866; was appointed at the General Conference of 1866 one of the commissioners on the part of the Southern Church to settle the property question with the Northern Church; wrote *Lectures on the Philosophy and Practice of Slavery* (Richmond, 1860), which may be considered as the fullest and ablest presentation of the proslavery view of the question. D. at Richmond, Va., Mar. 1, 1870.

Revised by A. OSBORN.

**Smith, WILLIAM FARRAR:** soldier; b. at St. Albans, Vt., Feb. 17, 1824; graduated at the U. S. Military Academy July 1, 1845; appointed brevet second lieutenant of topographical engineers; served as Assistant Professor of Mathematics at West Point, on several surveys, and on lighthouse-construction duty; in July, 1861, was appointed colonel of the Third Vermont, and was engaged in the first battle of Bull Run on the staff of Gen. McDowell. Commissioned brigadier-general of volunteers (Aug. 13), he served in the defenses of Washington until Mar., 1862, and in the Virginia Peninsular campaign of 1862; promoted to be major-general of volunteers July 4, 1862, he led his division in the Maryland campaign, at South Mountain, and Antietam. In Nov., 1862, he was assigned to the command of the Sixth Corps, and engaged at Fredericksburg; transferred to Ninth Corps Feb., 1863. In Oct., 1863, he became chief engineer of the department of the Cumberland and in November of the division of the Mississippi. In Mar., 1864, he was confirmed as major-general of volunteers, and in May assigned to the Eighteenth Corps; on special duty under orders of the Secretary of War Nov., 1864-Dec., 1865. In Nov., 1865, he resigned his volunteer commission, and in Mar., 1867, his commission as major of engineers in the regular army. He was breveted from lieutenant-colonel to major-general; president of the International Telegraph Company 1864-73; appointed police commissioner New York city 1875; president of the board Dec., 1875-Mar., 1881; civil engineer in service of the U. S. since 1881; by act of Congress of Feb., 1889, reappointed major U. S. army, and was retired Mar. 1, 1889.

**Smith, WILLIAM LOUGHTON, LL. D.:** b. in Charleston, S. C., 1758; educated in England and Switzerland; returned to Charleston in 1783; was a member of Congress 1789-97; an able supporter of the administration of Washington and Adams, and an active opponent of Jefferson, against whom he published a pamphlet; was minister to Portugal 1797-1800, and to Spain 1800-1801. D. in South Carolina in 1812. Author of a volume of *Speeches*, published in London 1794, an *Address* (1794) to his constituents on the difficulties pending with England, a *Comparative View of the Constitutions of the States* (Philadelphia, 1796), and various other political pamphlets.

**Smith, WILLIAM ROBERTSON, D. D., LL. D.:** theologian and Orientalist; b. at Keig, Aberdeenshire, Scotland, Nov. 8, 1846; studied at Aberdeen, Edinburgh, Bonn, and Göttingen; was appointed Professor of Hebrew in the Free Church College at Aberdeen in 1870; made an extensive journey in Arabia in 1879-80, which he described in a series of exceedingly interesting letters to *The Scotsman*. In 1881 he was removed from his office by an extraordinary act of the General Assembly on account of his critical views of the Old Testament published in the *Encyclopædia Britannica*. In 1883 he was appointed Professor of Arabic in the University of Cambridge; in 1886 librarian to the university, but exchanged the position for the Adams Arabic professorship in 1889, succeeding William Wright. He was associated with

was soon after increased to \$515,169, and in 1867 by a residuary legacy of \$26,210.63 to \$541,379.63, the total sum derived from the founder's beneficence, which by careful management had been in 1867 increased to \$650,000. At one time in the early history of the institution a large portion of its fund was in certain State bonds which became worthless: Congress appropriated money to make good the loss, and the permanent fund is held as a deposit at 6 per cent. in the U. S. treasury.

During the eight years that passed before any use was made of the money public opinion had an opportunity to shape itself, and the organization in Washington in 1840 of the National Institution (afterward the National Institute), which was intended by its promoters to become the nucleus for the development of Smithson's idea, gave opportunity for much experimental study in administration. The National Institute, which was for two or three years the largest and most active scientific society on the continent, developed many features which were ultimately adopted for the Smithsonian Institution and experimentally demonstrated that others were impracticable. It languished and died soon after the organization of the Smithsonian Institution, which it had hoped to incorporate with itself.

**Administration.**—The Smithsonian Institution was formally established by the act of Congress approved Aug. 10, 1846. As defined in the act of establishment it is composed of the President of the U. S., who is presiding officer *ex officio*, the Vice-President, the members of the cabinet, and the chief justice, and the "establishment" thus constituted is made responsible for the duty of "the increase and diffusion of knowledge among men."

In addition to the "establishment" the act provides for a "board of regents," by whom the business of the institution is administered, and which is composed of the President of the U. S., the chief justice of the Supreme Court, three members of the Senate, three members of the House of Representatives, and six citizens appointed by joint resolution of the Senate and House of Representatives, no two of whom may be from the same State, though two must be residents of the District of Columbia.

The presiding officer of the regents is the Chancellor, whom they elect from their own number. This position is customarily held by the Chief Justice. The executive officer is the secretary of the institution, who is also elected by the regents. The duties and responsibilities of the secretary are such as in other institutions usually belong to the office of director, but the name of "secretary" is that which in Washington designates the highest grades of executive responsibility. The secretary makes all appointments on the staff of the institution, is responsible for the expenditure and disbursement of all funds, is the legal custodian of all its property, and *ex officio* its librarian and the keeper of its museum. He presents to the regents an annual report upon the operations, expenditures, and conditions of the establishment, which is transmitted by the board to Congress for publication. By special act of Congress of 1884 an acting secretary is provided in case of the absence or disability of the secretary, the designation being left with the chancellor of the institution. There is at present but one assistant secretary, who is in charge of the National Museum.

The annual meeting of the regents is held in January; their executive committee of three members meets quarterly.

The first meeting of the board of regents took place Sept. 7, 1846, and before the end of the year the policy of the regents was practically determined upon, for, after deciding upon the plan of the building now occupied, they elected to the secretaryship Prof. Joseph Henry, and thus approved his plan for the organization of the institution which had already been submitted to them. Eminent alike as a man of science and an administrator, Henry for more than thirty years directed the activities of the organization.

**Objects of the Institution.**—These as defined by Henry are, first, to increase knowledge by original investigations and study either in science or literature; and, second, to diffuse knowledge not only through the U. S., but everywhere, and especially by promoting an interchange of thought among those prominent in learning in all nations. No restriction is made in favor of any one branch of knowledge.

The leading features of the plan of Prof. Henry were, in his own words, "to assist men of science in making original researches, to publish them in a series of volumes, and to give a copy of them to every first-class library on the face of the earth." Probably there is not a scientific investigator in the U. S. to whom a helping hand has not at some

time been extended by the institution, and the hand has often reached across the Atlantic. Books, apparatus, and laboratory accommodation have been supplied to thousands, and each year a certain number of money grants have been made. Not less important has been the personal encouragement afforded and advice given in the tens of thousands of replies written each year in response to inquiries.

**Publications.**—The publications of the establishment, which are regularly distributed to about 4,000 institutions, are as numerous as those of a great publishing-house, and are practically all given away. In addition to the annual report, which contains in its appendix articles of popular interest in regard to scientific progress, there are two series printed at the cost of the Smithsonian fund: (1) *The Smithsonian Contributions to Knowledge*, 28 volumes in quarto containing nearly 15,000 pages and many fine plates; (2) *The Smithsonian Miscellaneous Collections*, in 35 octavo volumes, aggregating about 22,000 pages. Besides these there are the series of *Bulletins* of the National Museum, 50 in number, beginning in 1875; the *Proceedings* of the National Museum, including already 1,100 separate papers, embraced in 17 annual volumes, beginning with 1878; the *Annual Reports* of the Bureau of Ethnology, beginning in 1879 and forming a series of 12 illustrated volumes in royal octavo; and the *Bulletin* of the bureau, of which 26 numbers have appeared. The value of the books distributed since the institution was opened can not be much less than \$1,000,000, estimating at standard publishers' rates.

In return for its own publications, and by purchase, the institution has received the great collection of books which form its library, and which is one of the richest in the world in the publications of learned societies. This includes more than 300,000 titles, the greater portion of which, by permission of Congress, have been placed in the National Library at the Capitol, where they are kept by themselves as the Smithsonian Deposit. The working libraries of the National Museum and the Bureau of Ethnology are distinct from the general Smithsonian Library, and separately administered.

**System of Exchanges.**—The Smithsonian system of international exchanges, begun in 1852, had for its object the free interchange of scientific material between scientific institutions and investigators in the U. S. and those in foreign lands, and its results have affected beneficially the libraries of most of the learned institutions in America. In 1867 Congress assigned to the institution the duty of exchanging fifty copies of all public documents for similar works published in foreign countries. Finally, in 1889 a definite treaty, made previously at Brussels, was formally proclaimed by the President of the U. S., wherein the U. S. Government, with a number of others, undertook the continuation of the exchange service on a more extensive basis. Out of this has grown the Bureau of International Exchanges, for the maintenance of which Congress partially provides by annual appropriation. From 1852 to 1883 the Smithsonian exchange service handled 1,175,000 packages. The number of correspondents upon its lists is about 24,000.

**The National Museum.**—The Smithsonian is by law the custodian of the National Museum, of which the secretary of the institution is the legal keeper. This museum is supported entirely by the Government, but previously part of its maintenance was from the Smithsonian fund. It is the only lawful place of deposit of "all objects of art and of foreign and curious research, and all objects of natural history, plants, and geological and mineralogical specimens, belonging, or hereafter to belong, to the U. S., which may be in the city of Washington in whosoever custody." The nucleus of these collections consists in the specimens brought home by the Wilkes and other early exploring expeditions, but for many years the museum was supported entirely at the expense of the Smithsonian fund, and a considerable portion of the collections is the property of the institution. See NATIONAL MUSEUM OF THE UNITED STATES.

**Bureau of Ethnology.**—The Bureau of American Ethnology is an outgrowth of activities begun in the early days of the history of the institution, and has for its object the investigation of the languages, habits, customs, and classification of the North American Indians. In 1879 a special appropriation was made by Congress for this work, which is (1895) still in progress under the direction of Maj. John W. Powell, who has been the director of the bureau from the start. With the aid of a well-trained staff, he has rescued from destruction a vast amount of important material in regard to the early inhabitants of the continent, priceless

For any segment of time  $dt = V \cdot dt$  the immediate decrease of the present substituting an undepreciated substitution has been calculated, it is then multiplied by  $\delta$  to obtain, upon re-evaluation of the  $\delta$  are being effected on.

At the 3rd, near Zolotarev Park, constructed by a housewife in 1948, within the 11 acres of the institution, occupies a tract of 2.0H acres, on the edge of 2 miles N. of the center of the city. The grounds are nearly barren as compared to those of many other collected parks and are possessed of substantial natural advantages, but the opportunities for the development of the park have not been sufficient to allow of any substantial progress.

The American Statistical Association is to be affiliated with the corporation, and transmit its annual reports to the corporate directors for the secretary.

This institution appears to fulfill the Integration of Educational Relations in Asia for the benefit of American universities.

His important feature of his meditation's work has been participating in the various expeditions. It was reported as Philadelphia in 1970, Rio de Janeiro, Lorain 1980, New York 1985, Guatemala 1989, Madrid 1992, and Santiago 1994, and on many occasions received awards of the most important Vedic.

There is a constantly held by the museum building, in which meetings of scientific bodies of national scope are held. Thus the National Academy of Sciences holds its annual meeting yearly; and the American Historical Association meets there at intervals. Here also such a course of popular lectures as the Institute is delivered under direction of distinguished professors of Washington.

The office of secretary has been held by three men: Joseph Henry, elected in 1846; Spencer Folsom Baird, in 1877; and Samuel Pierpont Langley, in 1890. Each in addition to his general administrative work in the institution has made some feature of the general work peculiarly his own. Secretary Henry, besides establishing the general system of, gave special attention to the publications, the history of ornithological studies, the library, and the development of the great system of international observation and exchange, in which he has since been transferred to another department of the Government, and now constitutes the Weather Bureau.

Dr. Huxley continued the development of the museum, which had been under his special charge during his absence. New Yards of service as assistant secretary, assisted in the construction of the new museum building, gave much attention to a splendid one, and carried on, in connection with his natural work as U. S. Commissioner of Fisheries, a most successful biological investigation of the waters of North America.

The necessary remedy is due the establishment of the National Zoological Park and of the astrophysical observatory, and a new system of encouragement of original research in zoological zoology as in the biological sciences. Under the administration of important donations and bequests have been added to the permanent fund of the institution. The most of the money, which may be low be permanently donated by the U. S. Treasury of 6 per cent, has nearly been exhausted, and Congress has recognized the authority of the institution to accept and administer other funds, beyond the above-mentioned fund, thus making it possible for it to increase the effectiveness of financial trusts for any purpose within the scope of the general plan, preserving in complete and full the name of the person by whom it was made. The proceeds have already been applied to several fundations. The Hodgkins fund, derived from the gift of Thomas G. Hodgkins, is being thus administered, as well as the Hodgkins fund, which is to be applied to the study of the life of the important discoveries in regard to the life of the life. The Allen fund, the bequest of Herbert P. Allen, provides for special investigations in the field of zoology, zoology, zoology, etc.

*Amalgamated*—The building occupied by the institution and  
 known as the *Amalgamated* is an ornate structure of cream-colored  
 masonry occupying a prominent place in the Mall which ex-  
 tends from the Capitol to the Washington Monument. It is a  
 large building in the Smithsonian grounds. It was planned  
 by John Russell Pope, and was in construction from 1897  
 to 1911. This is a stately, modern structure occupied by the  
 Smithsonian Institution, stands in the rear of the Smith-  
 sonian building, and the National Museum building of 1855.

**Smithsonite**—the mineral ore,  $\text{ZnCO}_3$ , required after smelting, was the product of the Smithsonian Institution. It crystallized in rhombohedral form of glassy habit, sometimes pure, with the formation of spathic and druse when pure and natural = 4.45 at 9°; Neumann and Levy both give 4.6. Smithsonite occurs in the U. S., abundantly at Lancaster, Pa., near Buckhannon, Pa., and at the Breckinridge mine.

Smith Stanley, Thomas, Secretary, No. 1000,

**Smoker's** bag smokes Dutch smoke (Dutch, Schiedamsche Pak), or the wargen, similarly, the product of an expected combustion. It is a coal, which is actually composed of carbonaceous droplets, rotting, and oxygen, the product of  $\text{C}_2\text{H}_4$ . The coal will be carbonaceous, chosen, and oxygen, which is added as a self-escape through the oxygen-deep and blood with the other phases under the force of heat and the combustible phase and vapor. But at the combination of coal to the fire in which it is generally burned is very long, often inflammable gases and vapors and large quantities of fine particles of carbon sink together with the dense, sulfurous, green and black and brown smoke, carbonaceous, the air, and dense a considerable loss of fuel. An abundance of a good means, and in large towns and industrial districts such a serious evil, no attention has been paid to the matter of burning it. This is attended with great practical difficulties, arising from the necessity of preventing the smoke from cooling and of supplying the considerable mass and vapors with the necessary amount of oxygen in order to make them burn with flame, but these difficulties are nevertheless not greater than may be generally overcome, as they have been in many single cases. See COMBUSTION.

**Smokeless Powders:** explosives acting without the production of smoke. They may be divided into three classes: 1. Those composed of cellulose nitrate either the fusible or solid variety, or both. 2. Those composed of the constituents of 1 mixed with nitro-glycerin or other organic nitrates. 3. Those composed of the constituents of 1 mixed with nitroderivatives of hydrocarbons, such as p-toluid and the pherates. Each of these varieties must contain oxidizing agents like barium or potassium chlorates and reducing agents such as benzene or pyrogallol.

Among the best-known and most successful of these powders are of the first class indicated, used by the U. S. army, and W. N., used by the French; of the second class indicated, used by the Italians; and finally, used by the British; and of the third class, Pyralis powder.

These powders are more or less smokeless because the products of their combustion are usually gaseous substances. For example, the products of the combustion of ordinary gunpowder are finely divided solids. This property of smokelessness is the feature of these powders which has attracted the widest popular attention; but though it is a desirable property, and one which has modified strategy and tactics, the most valuable property common to these powders is the high velocity which their impact, by propelling and which greatly exceeds those which it is possible to secure with black gunpowder.

In order not to endanger the gun it is essential that the pressure developed by the burning powder shall be within prescribed limits. The best powder is that one which gives the maximum initial velocity with the minimum chamber pressure, which gives uniform results when used under all firing conditions, and which undergoes no change, either chemical or physical, under the exposure incident to the military and naval service. The best powder thus far prepared for this purpose is from the firing trials of carbide made at Indian Head proving-ground, Maryland, when 26 lb. of this powder fired in the 6-inch service gun, imparted to a 100-lb. projectile an initial velocity of 2,400 feet per second, which is proved that about one pressure on the gun. Loaded rounds gave remarkably uniform results. See Exhibit.

1983-84: 25. 10. 1983

**Samarkand:** government of European Russia, S. W. of Moscow, and traversed by the Dnieper, which empties in the Gulf of Riga, and the Dniester, which flows in the Black Sea. Area 21,648 sq. miles, consisting generally of extensive plains interspersed with mountains. The climate is cold but beautiful, the soil is fertile, and well cultivated, yielding

large crops of rye, the principal product, and of hemp and flax. Tobacco and hops are also cultivated. On its extensive pastures large numbers of fine cattle are raised, while its vast forests, abounding with game, furnish a large amount of valuable timber. Much attention was formerly paid to the raising of bees, and honey and wax were exported. Copper, iron, and salt are found in considerable quantities. Its manufactures are unimportant. Pop. (1891) 1,412,162.

**Smolensk**: town; capital of the government of Smolensk, Russia; on the Dnieper; 250 miles W. S. W. of Moscow (see map of Russia, ref. 7-D). It is surrounded by massive walls, that are rapidly falling into decay, and has a magnificent cathedral, an episcopal palace, monasteries, several good educational institutions, including a military school, manufactures of linen, carpets, leather, and soap, and a considerable export trade in grain and flax. Pop. (1891) 38,034.

**Smollett, Tobias George**: novelist; b. at Dalquhurn House, Cardross, Scotland, in 1721; lost his father in early childhood; was educated at Dumbarton school by the care of his grandfather, Sir James Smollett, of Bonhill, a member of the Scottish Parliament; studied also at Glasgow, where he served an apprenticeship to a surgeon; went to London at the age of nineteen, carrying a tragedy entitled *The Regicide*, which he unsuccessfully offered to the theatrical managers; accepted the position of surgeon's mate in the navy; participated in the unfortunate expedition against Cartagena 1741; resided for some time in Jamaica; returned to England 1746; married in 1747, Miss Anne Lascelles, whom he had known in Jamaica; published in 1748 with great success his first novel, *The Adventures of Roderick Random*, in which he made good use of his West Indian experiences; visited Paris 1750; published *The Adventures of Peregrine Pickle* (4 vols., 1751); after endeavoring to obtain medical practice at Bath, settled at Chelsea 1753, in which year he wrote *The Adventures of Ferdinand, Count Fathom*; published a translation of *Don Quixote* (1755); issued *A Compendium of Authentic and Entertaining Travels* (7 vols., 1757), in which he embodied his own experiences at Cartagena; edited for some time a Tory organ, *The Critical Review*; was fined and imprisoned three months for a libel on Admiral Knowles (1759); wrote in fourteen months a *Complete History of England, deduced from the Descent of Julius Caesar to the Treaty of Aix-la-Chapelle* (4 vols., 1757-58), to which he subsequently added a *Continuation from 1748 to 1760* (4 vols., 1763), of which the later volumes have been often reprinted as a supplement to Hume; translated *Gil Blas* (4 vols., 1761); wrote in prison his *Adventures of Sir Launcelot Greaves* (1762); edited *The Briton*, a newspaper in defense of Lord Bute (1762-63); aided Thomas Franklin and other writers in bringing out a translation of the *Works of Voltaire* (37 vols., 1761-70); made a journey through France and Italy 1763-66, which furnished materials for a work of *Travels* (2 vols., 1766); satirized Bute and the elder Pitt in his *Adventures of an Atom* (1769); went for his health to Italy 1769, and wrote on the journey *The Expedition of Humphrey Clinker* (3 vols., 1771), his best novel. D. at Monte Novo, near Leghorn, Italy, Sept. 17, 1771. Smollett ranks with Richardson and Fielding as one of the standard novelists of the eighteenth century, founders of the English school of prose fiction. He was greatly influenced by Cervantes, Le Sage, and the whole group of Spanish "rogue" or *picaro* novelists. His stories are narratives of low life, travel, and broadly comic adventure, vigorous and racy, but coarse to the verge of brutality. In the persons of Commodore Trunnion, Jack Rattlin, Tom Bowling, and other nautical characters he introduced into fiction the now familiar figure of the British tar. Many complete editions of his novels and poems have been published. Biographies were written by Dr. Robert Anderson (1796), Dr. John More (1797), Thomas Roscoe (London, 1840; New York, 1857), and D. Hannay (Great Writers' Series, 1887). Revised by H. A. BEERS.

**Smolt**: See SALMON.

**Smuggling** [like Germ. *schmuggeln*, from Low Germ. *smuggeln*; connected with root *smug-* of Germ. *schmiegen*, snuggle up to, and O. Eng. *smigan*, creep]: the (statutory) offense either of bringing into a country articles entirely prohibited, or of defrauding the customs revenue by secretly importing goods upon which duties are laid without paying such duties or without paying the full amount required by law. In Great Britain the offense includes the exporting of goods with like intent, and (as often defined) the introduction of any articles into consumption without paying the

duties chargeable upon them. As the whole subject of the customs revenue is the creature of statute, the offenses which consist in its evasion or violation are also of a statutory origin. In Great Britain and Ireland smuggling is especially restrained by the Customs Laws Consolidation Act of 1875 (39 and 40 Vict., c. 36).

**Smuggling in the U. S.**—In the U. S. the regulation of this offense belongs exclusively to the jurisdiction of the national legislature and judiciary, being included in the power of Congress to regulate all foreign commerce. The body of the existing law is contained in the *Rev. Stat. of the United States*, especially in tit. xxiv., chap. 10, §§ 3065 to 3094 (although some provisions are scattered through other chapters relating to the imposition and collection of duties), and in the *Supp. of the Rev. Stat. of the United States*, p. 32, seq., where smuggling is defined as "the act, with intent to defraud, of bringing into the United States, or, with like intent, attempting to bring into the United States, dutiable articles without passing the same, or the package containing the same, through the custom-house, or submitting them to the officers of the revenue for examination."

**Penalties.**—The following penalties may be enforced for various acts which are collectively embraced in the general description of smuggling: (1) The guilty person is liable to a fine of not more than \$5,000 and not less than \$50, or to imprisonment for not more than two years, or to both. (2) The goods fraudulently introduced or attempted to be introduced are to be seized, and, if condemned by the court, are to be forfeited and sold. (3) The vessel in which the goods are thus imported may be likewise seized, condemned, and forfeited if the owner or managing agent was consenting to and guilty of the offense. (4) Any vehicle, conveyance, team, beast, etc., by means of which goods are wrongfully brought into the country by land may also be seized and forfeited; but no such conveyances belonging to and used by common carriers, whether persons or corporations, are liable to forfeiture unless the owner, superintendent, or agent in charge is consenting or privy to the illegal importation. (5) Various pecuniary penalties may be visited upon the owners or masters of vessels for certain specific violations of the law, such as resisting or hindering the revenue officers and the like; which penalties are made liens upon, and may be summarily enforced against, the vessels themselves. Cases involving any of the foregoing forfeitures or pecuniary fines are reported to the proper U. S. district-attorney, and it is his duty to prosecute the delinquent or to procure a condemnation of the property in the national courts.

**Detection of Smuggling.**—The customs officers are clothed with very large powers in order to detect and punish any fraudulent importation or concealment, or failure to pay the full duties required by the law. They may board and search all vessels lying in port, and all those bound to the U. S. while not more than 4 leagues from the coast. They may also search all persons coming into the country, all trunks, boxes, or other baggage, papers, envelopes, all conveyances and means of transport, stores, warehouses, and other buildings—in short, all places or things where the goods themselves or the evidence of their wrongful importation may possibly be concealed. Finally, by means of an order of the court they may obtain an inspection of the books of account and business papers of merchants and others suspected of or charged with the wrongful non-payment of duties. When the property seized is condemned and sold, the proceeds, after paying the costs and expenses, are distributed, part to the U. S., part to the principal customs officers of the district, and part to the informer if there was any distinct from the officer himself who detected the offense and procured the seizure. Revised by F. STURGES ALLEN.

**Smuts** [: Germ. *schmutz*, dirt; Dutch, *smet*]: the *Ustilaginæ*, an order of minute parasitic fungi principally attacking the higher plants, and often producing serious injuries to farm and garden crops (Fig. 1). In some portions of England they are known as dust-brands. They consist of slender, branching, colorless threads, which grow through the tissues of their hosts, following the intercellular spaces, or actually penetrating and even filling the cell-cavities. After a period of growth, the threads produce spores in great numbers, forming dark, dusty masses, which have suggested the popular name of these organisms.

No sexual organs are known in any of the smuts, and it is probable that in this group of plants the structural degradation due to excessive parasitism is so great that these organs have been lost. This degradation is shown in the soft-

walled cells composing the filaments, and also in the distorted and irregular spore-bearing masses (Fig. 2) which may be

FIG. 1.—Smut on Indian corn, reduced one-half.

regarded as crushed and distorted spore-sacs (asci). The spores arise within these crushed masses as rounded bodies,

FIG. 2.—Formation of spores: a b c, in *Ustilago maydis*; d e, *U. antherarum*; f, *U. flosculosorum*, magnified 900 times.

which soon acquire a dark-colored, thick, smooth, or rough-walled. At maturity the spores are set free by the deliquescence of the cell-walls of the spore-bearing masses. In a few cases the spores are borne singly, and rarely they appear to be in little distorted ascus-like cells (Fig. 2, c).

The production of spores usually takes place in those parts of the parasite which have penetrated the flowering or fruiting portions of the host, and which as a consequence are generally much distorted (Fig. 1). The spores are distributed by winds, after the rupture of the epidermis of the host and the escape of the surplus moisture.

FIG. 3.—Germination of smut spores: a, *Ustilago avenae*,  $\times 1,000$ ; b, *U. tritici*,  $\times 800$ ; c, *U. hordei*,  $\times 700$ ; d, *Tilletia tritici*; sp., the sporidia,  $\times 200$ .

upon which are borne minute spores (the sporidia), which are so minute that they may readily be dispersed by the wind. The parasite gains

access to the embryo host plant by penetrating the tender walls of the epidermal cells, and it appears that in many, if not all, cases it is impossible for such penetration to take place when the host has made a considerable growth.

The smuts are divided by Schroeter into two families, as follows:

I. *Ustilaginaceae*, with septate promycelium, bearing lateral sporidia. About 150 species, nearly all of which (143) belong to the genus *Ustilago*.

WHEAT SMUT (*U. tritici*), called also the "loose smut" of wheat, injures the heads of unripe wheat by destroying the kernels, and turning them into black dusty masses of spores (Fig. 4). The spores are very small (about  $5.5$  by  $6.5\mu$ ), ovoid or elliptical, and minutely verruculose.

OAT SMUT (*U. avenae*) affects unripe heads of the cultivated oat, destroying them before the ripening of the crop. The spores are larger than the preceding (about  $7\mu$  or  $6.5$  by  $8\mu$ ), globose or ovoid, and faintly verruculose.

BARLEY SMUT (*U. hordei*) likewise destroys the unripe heads of barley. The spores are nearly of the same size as in the oat smut (about  $7\mu$ ), globose and smooth.

The three foregoing species have generally been confounded under the name of *U. carbo*, or *U. segetum*, but investigations by Jensen, confirmed by Kellerman, prove them to be distinct. These experimenters have found that these smuts may be greatly reduced by immersing the grains for eight to fifteen minutes in water heated to  $56^{\circ}\text{C}$ . ( $133^{\circ}\text{F}$ .), then drying before sowing.

MAIZE SMUT (*U. maydis*) is parasitic upon Indian corn, causing swellings and distortions of the kernels (Fig. 1), and sometimes, also, similarly affecting the staminate flowers, and even the leaves and stems. The spores are large ( $8$  to  $13\mu$ ), globose and echinulate.

Other species occur on sorghum (*U. sorghi*), foxtail grass (*U. neglecta*), and many other grasses, sedges, knot-weeds, etc.

II. *Tilletiaceae*, with non-septate promycelium, bearing terminal sporidia. About 170 species, distributed among 9 genera, of which the principal are *Tilletia* (33 species), *Entyloma* (41), *Urocystis* (27), *Thecaphora* (18), *Sorosporium* (23).

BUNT, or STINKING SMUT (*Tilletia tritici* and *T. foetens*).—These two species, which differ in the first having reticulated spores and the second smooth ones, are parasitic upon wheat, filling the kernels at maturity with a mass of closely packed, fetid spores (Fig. 5). Both are common in the U. S., Europe, and most other wheat-growing countries. Bunt may be prevented by the hot-water treatment referred to above.

ONION SMUT (*Urocystis cepulae*) attacks the leaves of cultivated onions, often seriously damaging the crop in the eastern parts of the U. S.

LITERATURE.—In addition to the standard works on fungi, the reader is referred to the following: J. B. de Toni, *Ustilaginaceae*, in Saccardo's *Sylloge Fungorum*, vol. vii. (1888);

FIG. 4.—Head of wheat affected by *U. tritici*, reduced to one-half natural size.

FIG. 5.—a, head of wheat affected with bunt; b, kernels filled with spores,  $\times$  one-half; c, spores of *T. tritici*,  $\times 200$ ; d, spores of *T. foetens*,  $\times 200$ .

J. Schroeter, *Die Pilze Schlesiens* (1889); C. B. Plowright, *A Monograph of the British Uredineae and Ustilagineae* (1889); Kellerman and Swingle, *Report on the Loose Smut of Cereals, in Second Annual Report of the Experiment Station of the Kansas Agricultural College* (1889).

CHARLES E. BESSEY.

**Smyrna** [= Lat. = Gr. *Σμύρνα*. Cf. *σμύρνα*, myrrh]; city; in the vilayet of Aidin, Asia Minor; in lat. 38° 25' N. and lon. 24° 50' E., at the eastern extremity of the Gulf of Smyrna (see map of Turkey, ref. 5-D). It presents a magnificent appearance as seen from the water, spreading along the bay and up the slope of Mt. Pagus. A fine quay over 3 miles in length, along which the tramway runs, lines the shore, and in front is a spacious and sheltered harbor. Were it not for the hundreds of camels constantly traversing the quay, Smyrna with its modern edifices would be taken at first glance for a city of Western Europe. It still justifies its poetical names of Crown of Ionia, Eye of Anatolia, Pearl of the East. The slow deposits of the river Hermus and the quantities of rubbish thrown into the water threaten its existence as a port.

Its origin is lost in myths. According to tradition, Tantalus, about 1500 B. C., was its founder. Its name is said to be derived from Smyrne, the Amazon, the wife of Theseus. Colonized by the Greeks soon after the Trojan war, it was constantly fought over by the Æolians and the Ionians, and ultimately remained in the possession of the latter. Taken and dismantled by Alyattes, King of Sardis (628 B. C.), it was rebuilt according to the order of Alexander the Great by Antigonus and Lysimachus. It rapidly developed, and has since that time been the chief commercial city of Asia Minor. Here was one of the Apocalyptic churches. Captured by the Seljuk pirate Tzachas (1080), Smyrna suffered greatly, but was soon retaken by the Greeks. The Seljuk prince of Aidin conquered it (1313), but a crusading fleet drove out the Moslems. The Roman Catholic faith was introduced in 1346, and the city has contained ever since many members of that communion. Tamerlane, after defeating Bayezid I. at Angora (1401), filled up the port, carried the place by storm and butchered the inhabitants. Since 1424, when it was conquered by Murad II., it has remained in the undisturbed possession of the Ottomans save that it was sacked by the Venetians in 1473. The site of the city, though always near the bay, has changed many times. Smyrna has often suffered from earthquakes, notably in 177 (after which it was rebuilt by Marcus Aurelius), 1688, 1778, and 1880; and from plague, as in 1812 and 1837.

The streets run generally parallel with or at right angles to the shore. The houses are built of wooden beams encased in stone, as safer in fire and earthquake. There are several free hospitals, each prominent nationality having its own, and numerous churches of the leading Christian faiths, as well as a synagogue and several mosques. The schools are excellent, especially those maintained by the Roman Catholic and Protestant missionaries. Educational advantages are nowhere greater in the Ottoman empire. Six newspapers are published. Smyrna is the western terminus of the great inland commercial routes and of two railways that run eastward into the interior of Asia Minor. It is the chief mart for European commerce in Anatolia. The principal imports are sugar, coffee, cotton, silk and woolen goods, worked leather, nails, machinery, earthenware, building-stone, lumber, cordage, etc.; the exports, dried fruits, raw silk and cotton, opium, wheat, rice, valonia, oil, sesame, goatskins, carpets, wax, emery, cheese, beans, bones, mohair, etc. The exports average about \$20,000,000 annually in value, and the imports about \$15,000,000.

Smyrna possesses some remarkable ruins, as the Genoese castle on the summit of Mt. Pagus, the theater lower down, the stadium and scant remains of the temple of Diana. Pop. (estimated 1893) 225,000, of which about half are Greeks, the rest being Turks, Armenians, Europeans, and Jews. The Levantines, offspring of marriages between Europeans and natives, are numerous. E. A. GROSVENOR.

**Smyrna**: town; Kent co., Del.; on Duck creek, and the Phila., Wil. and Balt. Railroad; 36 miles S. W. of Wilmington, 60 miles S. of Philadelphia (for location, see map of Delaware, ref. 4-N). It is in an agricultural and fruit-growing region; is engaged in ship-building and the manufacture of agricultural implements, fruit-baskets, sashes, doors, and other articles; and contains a public high school, two national banks, and a weekly paper. Pop. (1880) 2,423; (1890) 2,455.

**Smyth, CHARLES PIAZZI, LL. D.**: son of Admiral W. H. Smyth; astronomer; b. in Naples in 1819; was employed for some time under Sir T. Maclear in the observatory of the Cape of Good Hope; was appointed royal astronomer for Scotland in 1845, which position he resigned in 1868; made a valuable series of observations from the Peak of Teneriffe 1856; published *Teneriffe, an Astronomer's Experiment, or Specialties of a Residence above the Clouds* (1858); in 1859 visited the Russian observatories (see his *Three Cities in Russia*, 2 vols., 1862), and made a thorough examination of the Great Pyramid of Egypt, which he considers to have been built under divine inspiration as a standard of a system of weights and measures. This theory is set forth and defended in three works—*Our Inheritance in the Great Pyramid* (1864), *Life and Work at the Great Pyramid* (3 vols., 1867), and *Antiquity of Intellectual Man* (1868). He composed a comprehensive star catalogue and ephemeris of selected observations of the same stars, published in the Edinburgh Observatory's publications (1877-86).

**Smyth, EGBERT COFFIN, D. D.**: educator; son of Rev. William Smyth (1797-1868), Professor of Mathematics at Bowdoin College; b. at Brunswick, Me., Aug. 24, 1829; graduated at Bowdoin College 1848, and at Bangor Theological Seminary 1853. In 1854 he was made Professor of Rhetoric and Oratory in Bowdoin College; in 1856 he succeeded Rev. Dr. Roswell D. Hitchcock as Professor of Natural and Revealed Religion in the same institution; and in 1863 was appointed Professor of Ecclesiastical History in Andover Theological Seminary. Since 1878 he has been president of the faculty there. He is one of the board of trustees of Bowdoin College, and was for a number of years a member of the prudential committee of the American Board of Commissioners for Foreign Missions. He translated (with Prof. W. L. Ropes) Uhlhorn's *Conflict of Christianity with Heathenism* (1879), has published many addresses, sermons, and scholarly articles, and was one of the founders and editors of *The Andover Review*. Revised by G. P. FISHER.

**Smyth, HERBERT WEIR**: Greek scholar; b. at Wilmington, Del., Aug. 8, 1857; A. B., Harvard, 1878; Ph. D., Göttingen, 1884; instructor in Williams College 1883-85; in Johns Hopkins University 1885-88; appointed Professor of Greek in Bryn Mawr College 1888; secretary of American Philological Association. He has published *Der Diphthong EI im Griech.* (1884); *Sounds and Inflections of the Greek Dialects*, vol. i., *Ionian* (1894); and various papers on philological subjects in *The American Journal of Philology*, *Transactions of the American Philological Association*, and *The Classical Review*. C. H. THURBER.

**Smyth, JOHN**: clergyman; b. in England about 1552; graduated at Cambridge 1575; became a fellow; took orders in the Church of England; was reprov'd by the heads of the university in 1586 for having advocated a Judaic observance of Sunday, but persisted in his teachings; connected himself with the Puritans; was minister at Gainsborough to a congregation with which he emigrated to Amsterdam in 1606; was converted to Baptist principles by Mennonite theologians; caused an Anabaptist separation among the Puritan refugees in Holland, and maintained controversies with Ainsworth, Robinson, and others. D. at Amsterdam in Aug., 1612. He was the author of *A True Description of the Visible Church* (1589); *The Difference of the Churches of the Separation* (1608); *Parallels, Censures, Observations*, etc. (1609); *The Character of the Beast*, etc. (1609); and a *Declaration of the Faith of the English People remaining at Amsterdam* (1611), etc.

Revised by W. H. WHITSITT.

**Smyth, NEWMAN, D. D.**: brother of Egbert Coffin Smyth; b. at Brunswick, Me., June 25, 1843; graduated at Bowdoin College 1863, and at Andover Seminary 1867; was at first pastor in Providence, R. I., 1868; was in Europe 1868-69; was pastor of the First Congregational church in Bangor, Me., 1870-75, of the First Presbyterian church in Quincy, Ill., 1876-82, and in 1882 became pastor of the First church (Congregational) in New Haven, Conn. He was assistant teacher in the Naval Academy in Newport immediately after his graduation, and was first lieutenant of the Sixteenth Regiment of Maine Volunteers in the last year of the civil war. He has published *The Religious Feeling* (1877); *Our Faiths in New Light* (1877; revised ed. 1887); *The Orthodox Theology of To-day* (1881); *Doorway to the Future* (1883); *The Reality of Faith* (1884)—a series of sermons; *Personal Creeds*, etc. (1890); *Christian Ethics* (1892); and various articles in reviews. Revised by G. P. FISHER.

whose presence in the nostrils will induce sneezing. When it is a symptom of cold, it indicates that catarrhal inflammation has induced a state of things similar to that produced by a foreign substance in the nose. In children measles may begin with this symptom, and influenza is also frequently so initiated. Revised by W. PEPPER.

**Snell, WILLEBRORD** (also known as **SNELLIUS**): astronomer and mathematician; b. at Leyden in 1591; succeeded his father as Professor of Mathematics at the University of Leyden in 1613. He discovered the law of the refraction of light. (See OPTICS.) He was also the first to calculate the size of the earth by means of a trigonometrical measurement of an arc of a meridian. The method of proceeding which he employed in this undertaking he described in his *Eratosthenes Batavus, sive de Terræ Ambitus vera Quantitate* (Leyden, 1617). He also wrote *Cyclometria, sive de circuli dimensione* (Leyden, 1621), and other works. D. at Leyden, Oct. 30, 1626.

**Snera**: See **MOGADOR**.

**Snider Rifle** (so called from its inventor): a rifle, the essential features of which are that the breech-block revolves around an axis on the right of and parallel to the axis of the bore, and the firing-pin passes obliquely from the nose of the hammer through the breech-block to the center of the base of the cartridge. This was the first form of breech-loader adopted by the British Government, which in 1866 directed that the old Enfield muzzle-loaders should be altered to breech-loaders upon this system. See **SMALL-ARMS**.

**Snipe** [M. Eng. *snipe*: Dutch, *snep*, *snip*: Germ. *schneipe*, snipe: Swed. *snäppa*, sandpiper]: any bird of the family *Scolopacidae*, which includes those known as shore-birds or sandpipers. (See **SANDPIPER**.) More commonly the name is restricted to the marsh-haunting species of the genus *Gallinago*, about twenty in number, which are distributed over the greater part of the globe, but more particularly in temperate regions. They have a straight bill, considerably longer than the head, grooved to the end, which is slightly expanded, well supplied with nerves and used in probing the mud for worms. The eye is placed far back, over the ear. The plumage is streaked with shades of buff and brown, black and white, and blends completely with the ground. The tail-feathers vary from twelve to twenty-six. The American snipe (*Gallinago delicata*) is found in suitable places over the greater part of the U. S., breeding in the northern portions and thence northward. In winter it migrates, occurring as far S. as Brazil. It is sometimes called English snipe; but that bird, although very similar, is a distinct species (*Gallinago gallinago*), which does not reach North America, although occasionally found in Greenland. The jack-snipe of Europe (*G. gallinula*) is the smallest of the group; the great snipe of eastern South America (*G. gigantea*) is the largest. F. A. LUCAS.

**Snipefish**: another name of the **BELLOWS-FISH** (q. v.).

**Snoho'mish**: city; capital of Snohomish co., Wash.; on the Snohomish river, and the Everett and Monte Cristo, the Gt. North., and the Seattle, Lake Shore and East. railways; 9 miles from Puget Sound; 38 miles N. N. E. of Seattle (for location, see map of Washington, ref. 3-D). It is in an agricultural, mining, and lumbering region, has regular steam-boat communication with Seattle, and contains a county court-house (cost \$30,000), 3 graded public schools, 5 churches, about 20 sawmills and shingle-mills, 2 sash and door factories, Masonic and Odd Fellows' halls, water-works, electric lights, street-railways, 2 national banks with combined capital of \$100,000, and 2 tri-weekly and 3 weekly newspapers. Pop. (1880) 149; (1890) 1,993; (1894) State census, 3,250. EDITOR OF "EYE."

**Snollsky, snoil'ské, KARL JOHAN** GUSTAF, Count (*Sten Tröst*): poet; b. in Stockholm, Sweden, Sept. 8, 1841. He made his first appearance in print, with several other young poets, in the publication of the Upsala society *Namnlösa sällskapet* (1860). His earliest collection of poems, *Smådikter* (1861), is characterized by great warmth and originality, especially in the descriptions of Italian life and scenery. His sonnets (1871) and his translation of Goethe's ballads (1876) are among the best of their kind in recent Swedish literature. His later poems, *Nye dikter*, etc. (1881), are more national in spirit, and display a deep sympathy for the unfortunate and oppressed classes of society. For a number of years he has served with distinction in the Swedish diplomatic corps. See C. D. af Wirsén, *Om Karl Snollskys skaldskap i Svea* (1882). D. K. DODGE.

**Snorri Sturluson** [usually written **SNOORRE STURLASON**]: the most celebrated historian of old Iceland. He was born in 1178, and belonged to the numerous and powerful clan of the Sturlungs. He was fostered by the prominent chief Jon Loptson, at whose home he acquired the book-knowledge of his day, and he became particularly familiar with the old poetry and saga literature of Iceland and Norway. At the age of twenty Snorre married a wealthy woman, and by this marriage he became one of the most powerful chiefs of Iceland and was able to attend the Althing at the head of about 900 armed men. He was made speaker of laws (*lög-sögumaðr*) several times, and for several years he was the richest and most influential man in the whole land. He became involved in the bloody feuds which in his time split the Sturlungs into warring factions, and he was continually implicated in litigation with his relatives and others in regard to property and inheritances. In 1218 he made his first visit to Norway, and was received into the household of the young king, Hakon Hakonson. In 1219 he visited the lagman Eskil in Sweden, and there he must have obtained that thorough knowledge of Sweden and Swedish affairs which appears in his writing. In 1220 he returned to Iceland, after having previously promised to work for the subjugation of Iceland to Norway. As he made no progress in the realization of this plan, he was suspected of faithlessness by the rulers of Norway, and his enemies in Iceland took advantage of this circumstance to bring about his ruin. After endless feuds in his own country, Snorre had to go a second time to Norway in 1237, but he lost the good will of King Hakon and was compelled to return to Iceland. On his arrival there he got into trouble with his son-in-law, Gissur Thorvaldson, who, at the instigation of King Hakon, murdered him on Sept. 22, 1241, at his home at Reykholt, where ruins of his splendid mansion are still to be seen. Snorre became Iceland's most distinguished sagaman, and he enjoys some reputation as a skald. As a writer of history he ranks with Herodotus or Thucydides. His *Heimskringla*, embracing an elaborate history of the kings of Norway to the death of Magnus Erlingson in 1177, is famous throughout the world. An English translation of this work was published by Samuel Laing in London in 1844, and a revision of Laing's translation by Rasmus B. Anderson appeared in London and New York in 1889. The *Younger Edda* also bears Snorre's name, and is to a great extent his work. See **EDDA** and **ICELANDIC LITERATURE**.

RASMUS B. ANDERSON.

**Snow** [O. Eng. *snaw*: O. H. Germ. *snēo* (> Mod. Germ. *schnee*): Goth. *snaiws*; cf. Lith. *snėgas*: Russ. *snigū*: Ir. *sneachd*: Lat. *nix*, *nivis*: Gr. *νίφα* (acc.) < Ind.-Eur. *sneghōs*: *snoghos*: snow]: the aggregations of minute spicules of ice into which the excess of vapor in the atmosphere is condensed when the temperature is at or below the freezing-point of water. These aggregations, called snowflakes, though assuming a great variety of crystalline forms, usually present the outline of a hexagon or a six-pointed star. (See the illustration in the article ICE.) In high and middle latitudes the ground is covered with snow each winter, but within the tropical regions no snow falls at or near the level of the sea, for the temperature of the lower atmosphere is always sufficient to melt it, even if it is formed in the upper air. In the northern hemisphere the limit of the fall of snow at the sea-level is an irregular line passing mainly between 25° and 40° N. lat.; in the southern it is more regular, lying in the continents between 37° and 38°. In general, this line is nearest to the equator in the regions most exposed in winter to the polar winds, as on the eastern coast of Asia and of North America. As the heat of the air decreases upward, the formation of snow is always possible upon high mountains, even under the equator. At the summit of the Andes and the Himalayas, for example, the moisture condensed during the rainy season falls in the form of snow, while it rains on the slopes and plains below. Thus in all latitudes from the equator to the poles the tops of high mountains are covered with a layer of permanent snow, which the summer heat is not sufficient to melt. The lower limit of perpetual snow, called the *snow-line*, varies in altitude in the different portions of the globe. Within the tropics it is found about 3 miles above the level of the sea; in temperate latitudes it descends to a little less than 2 miles; and at the northern limits of the continents it is about half a mile, or even less, above the level of the sea; while on the arctic islands vast fields of snow remain permanently very near the seashore.

**Snyff:** See TOBACCO.

**Snyders, FRANS:** painter; b. at Antwerp, 1579. He was a pupil of Peter Breughel, the younger, and afterward of Hendrik van Balen. He became a friend of Rubens. He began by painting still life only, but when he returned to his native city in 1609 after a visit to Italy, he began to produce pictures of the chase, in which he depicted the struggles of eager hounds with savage beasts at bay, introducing the human figure also. Rubens, whom he followed, sometimes made use of his services as an assistant. Snyders is celebrated as a fruit-painter. The Louvre possesses a *Concert of Cats* by him, and the gallery of the Prado at Madrid has many pictures of his, as also the National Gallery in London and the galleries of St. Petersburg, Antwerp, Munich, Dresden, Brussels, and other European cities. D. at Antwerp, Aug. 19, 1657. W. J. STILLMAN.

**Soane, Sir JOHN, F. R. S.:** originally called SWAN; architect; b. at Reading, England, Sept. 10, 1753; son of a bricklayer; was sent to Italy for three years (1777-80) as a traveling student at the cost of the Royal Academy; appointed architect to the Bank of England 1788; executed plans for the country-seats of many of the opulent gentry, a volume of which was printed in 1788; became clerk of the works to St. James's Palace and the houses of Parliament 1791, and Professor of Architecture at the Royal Academy 1806; published a volume of his plans of *Public and Private Buildings* (1828) and a *Description* (1827) of his own house and museum in Lincoln's Inn Fields, where he died Jan. 20, 1837. This house, with its art and antiquarian museum, he bequeathed to the nation. Among its treasures are pictures by Hogarth, Reynolds, and Turner, and models by Flaxman.

**Soap** [M. Eng. *sape* < O. Eng. *sāpe*; Germ. *seife* < Teuton. *\*saipjō*, whence Lat. *sāpō* > Fr. *savon*; Ital. *sapone*]: any salt of the fatty acids with a metallic base, usually a soda or a potash. All the true OILS and FATS (qq. v.) are decomposed by the alkaline hydrates, by certain metallic oxides, and also by acids, high steam, and hot water. In the decomposition of fats by alkalies the products formed are glycerin and the alkali salts of the fatty acids which were contained in the fats. This process is known as *saponification*. As a rule, soaps produced from soda are *hard soaps*, while those produced from potash are *soft soaps*. Castor oil, however, forms with potash a hard and brittle soap. A fundamental distinction between the hard and soft soaps is found also in the fact that in the former the glycerin is removed in the mother liquor or spent lye, while in the latter it remains mingled with the semi-fluid mass. Moreover, it is not possible to dry the potash soaps, owing to the very hygroscopic character of the base, while soda soaps may be so completely dried as to admit of grinding to powder.

Saponification takes place slowly in the cold, much more quickly by aid of heat, and the presence or absence of air is immaterial. The result depends on the nature of the fat or oil as well as on the base; e. g. if the fat is complex—containing, for example, stearin, palmitin, olein, etc.—then as many new salts are formed as there are fatty acids to combine with the base.

In the production of soap by the action of caustic potash on stearin (glyceryl stearate) the products are glycerin and potassium stearate; thus:

Formerly in North America and Russia much larger quantities of potash were obtained in clearing up forests than now, and hence potash soaps were produced in proportionate quantity. These were, especially in Germany, converted into hard or soda soaps by utilizing the property of the potassium-salts in decomposing common salt or sodium sulphate, forming potassium chloride or sulphate and soda soap. Moreover, the enormous production of caustic soda at a cheap rate consequent on the adoption of Leblanc's soda-process, stimulated by the great demand for bleaching-powders, of which sodium salts are a by-product, has well-nigh put an end to the use of potash in producing soap, excepting as an element of domestic economy in those regions where potash is still a common product. Thus in Canada and in some other parts of North America "pot-ashes" and "pearlashes" are still articles of considerable importance.

As a technical art, soap-boiling depends on the use of caustic lyes of a suitable strength for the saponification of fats, oils, and resins. The lye of the soap-boiler is a dilute alkaline liquor prepared by the action of slaked lime (calcium hydrate) on a boiling solution of 3 parts of potassium carbonate in 12 parts of water, or the same quantity of sodium carbonate (soda-ash) in half this quantity of water. "The manufacturer nowadays buys solid caustic soda or potash from the alkali-works. The sodium aluminate obtained by the decomposition of cryolite is used in the U. S. under the name *Natrona refined saponifier* for soap-manufacturing purposes" (Wagner).

The manufacturer of hard soap, having provided a stock of alkaline liquors (lyes) of various strengths, charges his soap-pan with a quantity of neutral fat or oil, and adds weak liquors of about 1.050° density. Soap-pans are made of iron plates riveted at the joints, and of various sizes, from 10 to 15 feet in diameter and of proportionate depth, set over fire-chambers, or more frequently heated by steam, either in jackets or injected from numerous small holes pierced in pipes introduced into the liquors. They vary in capacity, of course, but many hold from 20 to 30 tons of soap. As the temperature rises and the oil and alkali liquor mingle, a uniform milky emulsion is formed in which neither oily globules nor water are visible on cooling a portion of the fluid. The operator watches for this change, and adds more solution of alkali or water, as the case may require, until the emulsion forms and all alkaline taste has disappeared, using the tongue as a test. Stronger liquors are then added gradually to complete the displacement of the glycerin, which was begun by the weak liquors, and the boiling continues until a strong alkaline taste is detected. The workman then adds more fat or oils, and repeats the use of stronger lyes until gradually the soap-pan is nearly filled, taking care that at the last there shall be no excess of alkali. During this series of operations he often also adds a portion of resin, which by virtue of its constitution undergoes a kind of saponification with alkalies, and adds to the product more than its value in weight and volume. Then comes the next important stage of the soap-boiling operation, in which, by the addition of salt, the emulsion of oils and alkali is decomposed, the salt taking the water and causing the precipitation of the newly formed soap in a curdy or granulated state, floating on the denser spent lyes in which is found the glycerin and salt, but no alkali. This mother liquor, after the separation of the soap is complete, is withdrawn and rejected as having no value. The imperfectly developed soap is subjected a second time to a like series of operations as at first; it is brought by boiling to a homogeneous state, more oils or fats and strong alkaline liquors are added until the whole has a decided alkaline taste, and more salt is then added to cause the separation of the soap from the alkaline solution, and the whole mass is kept boiling for some time until all the fats, etc., are completely saponified. This completes the chemical part of the operation if the soap contains no rosin, and after allowing time for subsiding of the dregs the "curd" is transferred by skimmers to the "frames," where it cools and becomes solid preparatory to cutting up for use. If the soap contains rosin it requires a further treatment before framing—viz., the curds, after removal of the spent liquor and dregs, are melted with more water and boiled by steam or fire or both. A homogeneous compound results, containing an indefinite quantity of water, which is permitted to rest for two or three days, when it separates into a stratum of a definite compound containing about 65 per cent. of fat acids, 6.5 of soda, and 28.5 of water, and resting on a lower stratum of an indefinite compound containing much more water and the dregs or sediments of the operation. This lower stratum, called *nigre*, contains also an excess of alkali, and forms with the addition of fat and salt the staple of another "boil" for more soap. The *nigre* which accumulates with each boil is used as a mottling for clouded soaps, or may otherwise be worked up in subsequent operations. A strong preference at one time existed for mottled soaps, founded on the fact that in such soaps no excess of water could exist. The substances which impart the mottled appearance, being heavier than soap, were held in suspension only in consequence of its thick and pasty condition. It is, however, possible so completely to simulate the appearance of genuine mottled soap, by adding mineral and other colors during the process of hardening to soaps containing much more than the normal quantity of water, that this sign has lost its value, and such mottlings are justly re-

much esteemed in scouring wool, coarse linens, and for other like uses in the dyehouse. As it normally retains as inseparable from it the excess of alkali, the free glycerin and other impurities, there is no guaranty, as in the case of hard soaps, for its purity. Hence many methods have been practiced for reducing its cost—as, for example, the so-called bone soap, formed by the addition of the gelatin from ground bones, dissolved or partially decomposed by potash. In another plan hydrochloric acid is used to dissolve out the mineral matter of bones, leaving the gelatin, which, when carefully washed free of acid, is added during saponification to the fat. The soap with bones is called "Liverpool poor man's soap"; it is an open fraud, since gelatin and phosphate of lime can act only as useless diluents of soap. But this fraud is harmless compared with the use of the intestines of animals, skin, sinews, hoofs, hair, decomposed fish, and other animal refuse. Even naphtha, a non-saponifiable oil, and dextrin are sometimes employed in a like manner. Soft soap contains, according to quality, fatty acids, 50 to 40 parts; potash, 9.5 to 11.5 parts; and water, 88.5 to 50.5 parts in 100.

*Silicated soaps* contain either soluble silica or sand and powdered pumice, fuller's earth, and alumina. These substances act only mechanically as detergents, and may be permitted when a proper reduction in price is allowed. Sand soap, such as is used for scouring floors, contains as much as 75 per cent. of its weight of sand, and the French *savon-ponce* (pumice-soap) has from 20 to 26 per cent. of ground silica or pumice. These comparatively worthless mechanical mixtures have been replaced by soap in which soluble glass, or silicate of sodium, is employed with advantage. This feeble alkaline compound has by itself a considerable detergent power, and when mixed with ordinary soap an article of greatly reduced price and useful for many domestic and manufacturing operations is produced. These silicated soaps are quite strongly alkaline, owing to the nature of the soluble glass; this excessive alkalinity is reduced for some purposes by combining, with the soap, rosin or fatty acids, as in the ordinary process of soap-making. Carbonic-acid and sulphurous-acid gases are likewise passed into the liquid for the purpose of partially neutralizing the excess of alkalinity.

*Toilet-soaps* are made from very pure and sweet materials—sweet almond oil, beef-marrow, refined sweet lard, saponified without heat and perfumed with various essential oils. Very pure curd soap is also used for the foundation of toilet-soaps, for which purpose the soap is reduced to thin shavings, melted over a water-bath with rose and orange-flower water and common salt—24 lb. of soap, with 4 pints each of rose and orange-flower water, and about half a pound of salt. When cold next day, it is cut in small bits and dried in the shade, again melted down with the same proportion of orange and rose water, strained, cooled, and dried again. The heavy animal odor is thus removed, when it is powdered and left in a clean place exposed to air for some days. After this, it is ready to receive the desired perfume, and may be colored with aniline tints, ultramarine, etc., and moulded in forms for use. *Shaving-cream* is made by beating up lard with once and a half its weight of potash-lye, and perfuming and coloring as desired. *Glycerin soap* is prepared by mixing pure glycerin with a toilet soap, or with the transparent soap produced from its solution in alcohol. It mollifies the skin in cold weather.

*Properties of Soap.*—Besides its detergent properties every kind of soap in use contains a variable quantity of water, partly in chemical combination; and its power of absorbing water is also very various, being from 7½ per cent. in hard soda soaps to 162 per cent. in soft potash soaps of oleic acid when previously dried by artificial heat. Soap is perfectly soluble in alcohol, as also in hot water, both solutions becoming of the consistency of a jelly on cooling. In this state, mixed with camphor and oil of rosemary, the alcoholic tincture of soap is familiar as opodeldoc, or *linimentum saponis compositum* of the *Pharmacopœia*. Tincture of white soap is readily decomposed by salts of calcium and magnesia, and is familiar to the chemist, when made of normal strength, as the most convenient test for the hardness of natural waters (Clark's test). Potash soap is more soluble in water than soda soap. The sodium stearate is hardly affected when placed in 10 parts of water, while potassium stearate thus treated forms a stiff jelly. Sodium oleate dissolves in 10 parts of water—potassium oleate in 4 parts, and it forms a jelly even with 2 parts. Cold water partially decomposes the alkaline oleates, palmitates, and

stearates (common soap), the neutral salts being resolved into alkali, which dissolves, and the free acid, which precipitates. This explains why in using soap, even with pure water, its transparency is always disturbed, while the alkaline property, and consequent detergent power, of soaps is due to the liberation of a portion of caustic potash or soda, which attacks and removes the grease of foulness, etc.

The value of soap depends mainly on the amount of dry soap (the real soap or alkaline salt of the fatty acids) in any given specimen. The loss in weight of a given amount of soap cut in thin shavings, when completely desiccated in a drying oven, at 212° F., is hygroscopic water, which should not for best hard white soap exceed 20 per cent., for mottled soap 25 per cent., and for yellow soap 30 per cent. The fat acids vary from 60 to 70 per cent., and the alkalies from 7 to 9 per cent., according to quality. As before mentioned, soaps made from coconut oil contain normally much more water, and in the yellow soaps from 10 to 20 per cent. of the fatty acids are replaced by rosin.

Soap was not known to the ancients. It is first mentioned by Pliny, who refers to it as something used by the Romans for the purpose of beautifying the hair. Geber in the second century states that soap was prepared from various kinds of tallow with potash and lime. It is stated further that soap is used as a medicine, and that by means of it all dirt could be removed from the body and clothes. For more details respecting the manufacture of soap, consult Richardson and Watts, *Chemical Technology*; Mitscherlich's *Chemistry*; Watts, *Dictionary of Chemistry*; Ad. Wurtz, *Dictionnaire de Chim.*; R. S. Cristiani's *Soap and Candles*; Dussance's *Manufacture of Soap*; Thorpe, *Dictionary of Applied Chemistry*. Revised by IRA REMSEN.

**Soapberry:** the fruit of the *Sapindus saponaria* and *S. inequalis*, West Indian trees of the family *Sapindaceæ*. The pulp is a powerful detergent, much stronger than ordinary soap, and the hard shining seed has been exported and used for making buttons, which are very durable. In the southern parts of the U. S. there grows another soapberry-tree, *Sapindus marginatus*, which is sometimes 40 feet high. There are various tropical species which have a fruit with an edible pulp, but the seed is often poisonous. These trees have no practical importance. Revised by L. H. BAILEY.

**Soapstone:** See STEATITE.

**Soapwort:** a name sometimes applied in a general way to the plants of the family *Sapindaceæ*, on account of the soapy quality of the fruits of many species. It is also the name for plants of the genus *Saponaria* (family *Caryophyllaceæ*) and other plants of the same family, which are sometimes utilized for their detergent powers. There are in many parts of the world vegetables which are excellent substitutes for soap. In some instances this cleansing power depends upon the principle saponine, found in plants of widely diverse families. In the common soapwort the root and the leaves contain saponine, in consequence of what they often are used for washing. The root has also medicinal properties. Revised by CHARLES E. BESSEY.

**Sobieski:** See JOHN III., SOBIESKI.

**Soccage, or Socage:** See TENURE.

**Socialism** [from Lat. *so'cius*, sharing, associated, (as noun, fellow, partner, companion)]: a conscious endeavor to substitute organized co-operation for existence in place of the present anarchical competition for existence; or the system of social organization calculated to bring this about. This definition, though it gives, perhaps, adequate expression to the active and practical side of socialism, leaves out of account altogether its theoretical basis. From this point of view socialism is an attempt to lay the foundation of a new science of sociology, which shall enable mankind, by thoroughly understanding their past and present, to comprehend, and thus, within limits, to control the movement and development of their own society in the near future. Consequently socialism in its wide sense is not, as is still commonly thought, a mere aspiration for a better state of society, still less only a series of proposals to mitigate the evils arising from the present social arrangements. Modern scientific socialism essays to give an intelligible explanation of the growth of human society, and to show that as each step in the long course of development from the institution of private property, through chattel slavery, serfdom, and wagedom, was inevitable, so the next step from capitalism to socialism is also inevitable. The object which socialists have in view in their propaganda is that this, the final trans-

to those who were in a position to purchase this their only commodity by the payment of daily or weekly wages. The payment of wages by no means began with the decay of feudalism; that form of remuneration for services rendered has itself a history extending over many centuries. But the difference between the wage-earner who accepted wages from others in the intervals between laboring for himself and the wage-earner for life, between the independent property-owner and the propertyless hind or "hand," is a difference not only of degree but of kind. The former was, on the whole, economically free, however badly he might be paid in mere money; the latter is economically a mere dependent, no matter to what point his wages may temporarily rise. These wage-earners employed by a master who had accumulated capital by commerce, the slave-trade, or piracy, worked together in co-operation in the workshop. They produced, primarily in social combination, articles of social use, for a social purpose, in the shape of exchange. But these workers had no share in the ownership of the raw material, no say in the quantity or quality of the articles produced, no control over the finished product, which belonged to the master. They received in the shape of wages that which represented on the average their cost of subsistence, in accordance with the standard of life of their class, so long as their employer required their services. What then had happened? A great and crucial change had been brought about. The individual form of production had been transformed into a social form of production; but the form of the ownership of the articles thus socially produced, as well as the control over their exchange, remained in the hands of the individual master or employer. Society at this stage—and the process can be traced at various periods in the development of all civilized nations—passed from an economical condition in which production as well as appropriation and exchange were in the main individual, to a condition of society in which production became social, but appropriation and exchange remained at the entire disposal of individuals. This manifestly involves a direct economic antagonism, and that initial antagonism lies at the root of all the antagonisms of the modern system of capitalist and wage-earning production for exchange and profit. Competition now ruled the market. Competition by free, propertyless wage-earners below; competition for increased profit by capitalists and employers above. The latter were driven by the very necessities of their existence to sweep aside the old local restrictive laws of the Middle Age period; and, as they gained strength, they were likewise impelled to substitute their own commercial control in politics for that of the classes which had hitherto been supreme. From this time forward all improvements and inventions went into the hands of the capitalist class and were shared by them, though much against their will, with the landlords.

Such was the course of events in Great Britain, where the economic transformation was soonest effected, the removal of the people from the individual or collective ownership of the soil having first been carried out. Geographical position and the character of the people favored this earlier development in England, but all civilized countries have followed, or are following, along the same road. Not, however, until the end of the eighteenth century, when steam and the great machine industry became the dominant factors in production, was it possible for the owners of the capital and machinery to obtain complete control over the wage-earners, and to marshal the industrial army under their management in disciplined array. With the factory industry, founded on the inventions of Watt, Hargreaves, and others, it may be said that the last great system of human slavery was firmly established, and wherever it has been allowed to flourish unchecked it is unquestionable that the cruelty and physical degradation by which it has been invariably accompanied fully equal, if they do not surpass, in horror the records of the old chattel slavery and serfdom. The British official blue-books show, indeed, that at the end of the eighteenth century and the beginning of the nineteenth, when unrestricted freedom of contract prevailed between the owners of the means of production and the workers, women and children, to say nothing of men, were treated with more entire disregard for common humanity than were slaves or serfs at any time whatever. Similar causes have produced like effects in other countries, and the condition of the working population in the great cities on both sides of the Atlantic, as set forth in official reports, proves that comparatively little has been done to remedy the evils which are inherent in the competitive system of wage-earning. At

the same time the limited market of the Middle Ages has been converted into a universal international market. Even the nations that resorted to the most stringent restrictive tariffs have been unable to extricate themselves from the great market of the world, which capitalism has steadily extended since the discovery of America. Commercial wars have but served to expand the ever-widening circle of international commerce, and the demand for fresh markets to meet the growing output of commodities, due to the increasing power of machinery, has been the means of pushing expeditions into the remotest parts of Asia and Africa. Capitalism, therefore, in pursuing its inevitable course and in working out the law of its being, like the great slave-supported civilizations of antiquity and the feudalism—by no means confined to its European manifestation—which followed, has unconsciously prepared the way for a closer understanding between the inhabitants of this planet than had ever before been possible. The long slow movement of economic development which arises out of the institution of private property is thus approaching its close, and we are on the threshold of the greatest and most crucial transformation that the world has ever seen. To convince the dominant classes in every country that such a transformation is inevitable, while educating and organizing the producing classes, so that they may consciously and intelligently take advantage of the opportunities which they inherit from the long martyrdom of man to the forms of production and exchange—such is the task of the advocates of socialism.

It has been seen that when European society in the Middle Ages changed from the form of production by individual free men for individual use, only the surplus coming into exchange, to the form of production in which groups of wage-earners worked in social organization under employers, all the goods being made for the express purpose of exchange, no similar change was made in the ownership of these products. That remained in the hands of an individual as before, who competed with other individuals, similarly placed in economic control of nominally free workers for the sale of his products. That which distinguishes this capitalist system of production from all previous systems is that it is carried on primarily for profit and exchange. Goods are of no immediate use to those who produce them. They are made to go upon the market under the control of the employer who in order to keep his business going must sell them for cash in competition with others, who likewise sell for cash; and, in practice, he can only hold his place by steadily increasing his turnover. Cheapness being the determining force in the bitter commercial conflict of the markets of the world, each producer or manufacturer is compelled to cut down his cost of production to the lowest point possible in order that he may be able to undersell his rivals and thus enlarge the scope of his trade and therewith his personal profit. So early as the middle of the seventeenth century the great economist Sir William Petty could speak of "the trade of the world" as falling to the seller of the cheapest products. Assuming free competition to exist, this is even more true now than it was then.

*Economic Antagonisms under the Modern Industrial System.*—What, however, is the law which governs the exchange of commodities under the capitalist system of free competition—commodities being articles of recognized social use in the social conditions of the time, produced primarily for the purpose of profit and exchange? Such exchange is on the average conducted on an equality, and the relative value of commodities so brought forward for exchange is governed by the amount of social labor which it takes to produce them, or which is incorporated in them. It is impossible to tell whether a bushel of wheat is the product of the best or the worst land, or whether a bale of cloth has been made by hand or by the most improved or by inferior machinery. Neither is it possible to establish directly how much social labor is embodied in the articles so brought forward for exchange. This can only be arrived at indirectly, by way of such exchange and through the higgling of the market. But the amount of social labor necessary on the average to produce the two articles exchanged comes behind both parties to the transaction and settles the terms on which business will be done. Any reduction in the average amount of social labor incorporated in either of the commodities will reduce its value to a proportional extent relatively to the other. Gold in present conditions being, when dug from the bowels of the earth, a representative of incorporated social labor value, serves as a medium of exchange

exchange as a standard of value for the various commodities; but the use and choice of value due to variations of demand and supply, as particular products are advanced upon the whole, and do not disturb the level of exchange on the basis of a generalized social labor.

The free laborer without private property who is obliged to sell his labor-power as a commodity in order to live, exchanges it on the same basis as other commodities. He is more constrained by the demand of social labor which, on the average, is necessary to keep the laborers alive on the average standard of life in their trade in the country where they reside. The product they receive from the employer is the form of money-wage, with which they in turn buy food, clothing, housing, and the like. So far the exchange is conducted on the principle of all exchange of commodities. But the special commodity which the wage-laborer sells—his power to labor—unlike—products in the course of the day or week or month considerably more value than the worth of the wages which he is paid. From this surplus labor-value incorporated in commodities the capitalist derives his profit, the landlord his rent, the entrepreneur his brokerage, the banker his interest, and so on. On the other hand, the wage-owners—the labor which they give in exchange of the value of the wages they receive—find outside the capitalist class and their associates to pile up riches and capital. Although individual capitalists may or may not, those can be no rule for the class as a whole. It is possible for them as a class to be absolutely certain, but in order to enhance this profit in circumstances where they are pressed by the competition of their fellows, individual capitalists, and not consequently the whole class, have naturally endeavored to reduce wages, to prolong hours of labor, to introduce improved machinery, and to turn out as many goods as possible, so as to obtain by their surplus labor-power the greatest amount of social labor embodied in a given quantity of a larger sale. The wage-laborers being obliged, and their conditions are very wrong and even afterward, to compete with one another for the sale of their sole commodity, labor-power, which will not keep under rapidly sold, often accept lower rates of wages because they must do this or starve. The course of the employer seems a necessity of existence to them, and a social constraint of labor for profit is often regarded as a social constraint; but it is manifest that the interests of the wage-earning class and the capitalist class can not by any possibility be in reality identical, though it may be and is in the temporary interest of a particular set of wage-laborers that their own individual employer should be successful. Those who are contributing of their vital strength and health to the form of unpaid labor to build up fortunes for others here, of necessity, whether they themselves recognize it or not, in a position of direct class antagonism to those others; however true this antagonism may be disguised or glossed over, but this class antagonism between wage-laborers and capitalists, or, to use the older French term, between proletarians and bourgeois, is itself the direct result and the immediate form of expression of the conflict already indicated in the social and simple strife between the social form of production and the individual form of appropriation and exchange.

Some of these two initial antagonisms, however, others arise in their turn. The factory industry, for example, and the mining industry, and agriculture carried on upon a large scale with machinery, call for the most thorough organization and everything in the shape of organization or discipline is done on the part of the employees to secure a final, as it is absolutely essential, from the profit-making point of view, that there should be no waste of time in business hours, and that the whole of the plant, mechanical and human, should work on with unvarying regularity, as if the various parts were dovetailed into one another. This perfecting of organization and machine-like cooperation has been effected under the capitalist system to a degree which no doubt would have seemed quite impossible, and great numbers employing thousands of men and women produce their goods and to great a scale with steady regularity. There is a organization in the factory, the workshop, and the mine, but it is everywhere opposed to the free anarchy of the market, as at Christmas when competition capitalism is in full swing. Each factory at that period is concerned solely with its own output, each farm or each farm with its own products. The plan of all being to turn out as much as any one else can make as quickly as possible with a view to the getting as large a profit as may be while trade is flourishing.

No one takes the least account of the proceedings of his neighbor being too deeply engaged in fighting for his own hand. Thus the complete concentration of production in the factory leads to complete anarchy in the exchange. Further, in order to continue his operations successfully each merchant, farmer or producer of any kind must convert his finished goods or products into money before he can begin again, and must needs stagnate the operation. He can not exchange his products direct for the products of any limited production, good for the purposes of his own consumption. They must be converted into money first in every case. If the circulation of the commodities been in any way impeded, then it at once appears that there is a difficulty in the way of continuing business—that money can not at once be realized for those goods which have been thus thrown upon the market. Money, in fact, then becomes temporarily a means for hindering exchange instead of its facilitating it, and it is apparent that in such conditions there is a clear antagonism between commodities and gold, or its equivalent equivalent paper. Again, the tendency of modern society to gather the population into great bodies leading to social interests has developed another antagonism as a partial result of these already specified, between town and country. The interests of the two are frequently found to be antagonistic instead of harmonious and one of the great problems of the future will be to secure a lasting and an operational agreement between these two great departments of human life and industry. Moreover, the capitalist system of production has developed an antagonism between the sexes and even between parents and their children. This antagonism never, like all the rest, from economic causes. The family, in its ancient sense, has been destroyed, and men are met in the whirl of competition for wages, for women who, owing to a variety of causes, compete with them on a lower standard of life for a lower rate of wages. Children, as like men, are in many countries brought in to compete against men and women. A man's foes in this instance are literally they of his own household; though in this as in other cases the workers themselves do not perceive the mischief which is being done to themselves, and at the same time to the whole community. Of the antagonism between skilled and unskilled labor, between peasant, organized workers and trade unionists between employed and unemployed, it is unnecessary to speak; these struggles are too apparent to all who study the history of society in the nineteenth century.

The Cause of Commercial Crises.—Even since the capitalist system became the predominant form of production in civilized countries, ups and downs of trade, periods of inflation alternating with periods of depression, have been the rule. So much is this the case that they are taken for granted by men of business, who base their calculations upon such fluctuations, but are seldom able to grasp the causes of them. (See *Causes of Crises*, by George.) These sudden collapses of trade are generally regarded as being as much beyond human control as an eclipse or an earthquake, a tempest or a long frost. They are, nevertheless, indisputably the result of social causes, which, when they are understood, can be regulated and controlled. The most remarkable feature in all these successive catastrophes from 1812 to 1863, before as after the universal use of steam-vessels, railways and telegraphic cables, was that they were preceded and accompanied by an excess of products in every department. In all previous commercial epochs, as in barbarous countries at the present time, general depression of trade has arisen from drought or from flood, from bad harvest or from pestilence among men or cattle, in any case from an insufficient supply of necessities. Only among the most civilized peoples does an excess of what the world requires become an immediate cause of stagnation, and the reason why thousands of workers in all countries are prevented from earning their livelihood. At this time the power of man to produce wealth in every department of industry, including agriculture, is far greater than it has ever been before. Hence this enhanced productive capacity seems to some way to have become a universal and a certain hindrance to production and exchange. Whence does this result? The control of all the great means and instruments of production, the direction of the large industrial machine, the arrangement of the amount of labor to be directed to great public works or to the output of commodities, the initiation of fresh enterprises and the adoption of new inventions, all these rests with the capitalist class, and the workers whom they employ. When, coming to various crises, a flow of good trade begins, all the financiers, capitalists, manufacturers, mine-owners, and so forth, begin work, and proceed

to take advantage of the days of prosperity rendered the brighter by contrast with the previous gloom. The unemployed workers, who are an unfortunate necessity for the due functioning of the capitalist system, are absorbed into activity, the demand for goods from every quarter increases, prices (not values) rise all along the line, great works, such as railways and canals, are again undertaken, huge vessels are laid down in all the ship-building yards, demand in one direction enhances demand in another, wages are paid on an almost unexampled scale, and goods are turned out in greater abundance than ever before. But at the very moment when the expansion is at its height the collapse begins. Suddenly a difficulty arises in disposing of one set of goods for money, a large capitalist has to press his bills or his commodities upon the market in order to realize their value for immediate cash. Others pursue the same course. There is a general rush to sell. The antagonism between gold and commodities is felt in earnest. Prices fall more rapidly than they had risen. Workmen are discharged, factories are shut down or run on short time, furnaces are blown out, shipping-yards are closed, railways are suspended. A crisis has begun; the incapacity of the capitalist class to handle effectively the machinery of modern civilization is proclaimed to the world, and bankruptcy and stagnation at once follow. The social form of production revolts against the individual form of the exchange.

*Tendencies toward the Socialization of the Means of Production.*—At this point socialism comes in and, having completed its analysis, shows how the antagonisms inherent in the capitalist system must be solved by making exchange social, as production is social; by establishing co-operative production and distribution in the place of competitive wage-labor and competitive capitalism. That which in itself is desirable from the *a priori* point of view, society is even now anarchically and unconsciously working up to. The entire series of differentiations arising out of the establishment of private property having been passed through, the complete reintegration of collectivism or communism on a higher plane is even now in progress, without the vast majority even of intelligent and educated men being in the least aware of it. Socialism is asserting itself in modern society by reason of economic causes, as capitalism owed its predominance before to the action of the same causes.

Thus the capitalist class in all civilized countries have championed competition and unlimited right of free contract between the wage-earners and their employers; but the hideous results of this scramble in the shape of physical degeneration, with accompanying mental and moral degradation, alarmed even the modern state, and laws have been passed to limit the freedom of the masters and servants alike in order to check in some degree this serious deterioration. At the same time, and as if in spite of themselves, modern statesmen, while upholding stoutly the doctrine that everything is best done by private effort, have been impelled to set on foot a number of public services, national and local, whose duties are continually extending in the face of all the protests raised by the older school of economists. Moreover, there is a growing feeling in every civilized nation that the hours of labor as well as the wages of the workers in these public services should no longer be governed by the law of competition for subsistence wages, but that the governments and municipalities should assure to their servants a day's work of no more than reasonable length in proportion to the intensity of their toil, and wages adequate to obtain for them a decent standard of life. This view, though still far removed from socialism, is manifestly a portion of a movement which is leading toward it. The public services are, in short, being transformed in the interests of the workers with the assent of the whole community. In like manner the public health, the improvement of the conditions and surroundings of the workers of the cities in particular, in order to secure to the working population a better physical development and some enjoyment of life—this also has become a matter of general concern to which national laws and state and municipal ordinances give expression. Such measures as these may be reckoned as conscious though small endeavors on the part of society to correct the evils of existing anarchy and to prepare the way for a better system.

Far more important, however, are the unconscious strivings toward the new period. On the one hand, the formation of companies, consisting of many bondholders and shareholders, to carry out great public works, and the transformation of private concerns engaged in all the depart-

ments of production and distribution into similar companies, form a distinct move in the direction of socialization. The individual employer is merged in a multitude of shareholders, and the pecuniary relation becomes the sole and only tie between employers and employed. This company form is manifestly an unconscious step toward socialism, seeing that these great organizations and corporations, whether for production or for distribution, are controlled and directed by managers and boards of directors who, regarding the matter solely from the economic point of view, might as easily be appointed by the workers to carry on the business in the interest of the community and the workers themselves as be nominated in the way they are to-day by shareholders who, in the majority of cases, have no direct knowledge of the affairs from which they derive an income, and perhaps have never been within hundreds or thousands of miles of the place where "their" factories, or mines, or works, or railways, or lands are situated. So soon as this economic possibility is generally recognized the final change has begun; but at the same time that this modification from the individual form into the company form of ownership and appropriation is taking place, the private firms and the companies are alike abandoning competition for co-operation. Banks are being consolidated, nationally and internationally; shipping companies are agreeing not to compete; joint-stock associations form trusts and "rings." In the U. S., where unregulated competition attained perhaps its highest pitch of development, this form of industrial and financial monopoly has unquestionably become more striking than anywhere else. This process is going on in all civilized countries. Moreover, the introduction of improved processes of manufacture, which was formerly hastened by individual anxiety to compete on better terms, is now hindered by the disinclination of monopolists to disturb vested interests with which they are well content. Thus the capitalist system of production no longer favors human progress, but heads back the economic evolution, and brings about periods of recurrent anarchy in every department of industry. Capitalism therefore is making plain the way before the face of socialism by its unconscious but inevitable institution of monopoly. The other human side of this great economic antagonism is likewise unconsciously organizing its forces to capture these monopolies. Throughout the civilized world the workers are beginning to see that whatever be their nationality, whether they are men or women, skilled or unskilled, their true interest lies in the thorough combination of labor with a view to the final overthrow of the wage system. Socialism is accepted only by the minority, but its principles are spreading daily, and ere long it will be universally recognized by the toilers that mere strikes, however well organized, are almost as hopeless a method of struggling against the domination of capital as was the old plan of machine-breaking. The machines were used against the interests of the workers; therefore they, in their ignorance, tried to destroy them, instead of combining to capture them. The great monopolies are in like manner used against the workers; therefore they, in their ignorance, attempt to strike against them, instead of using the political machinery at their command to obtain possession of and manage them. But with national and international organization come also education and full appreciation of the facts of their social surroundings. Then the producers will constitute practically the whole community, can move forward in fraternal solidarity and educated comprehension, to take advantage of the economic conditions which have been prepared for them. Each nation must of course follow the route marked out for it by its previous economic history and its geographical position. It seems certain, however, that no matter by what means it may triumph socialism will begin with the public services and the more highly developed company forms, and proceed until production is last organized on the land which has not yet reached the company form in any country.

With the establishment of national and eventually of international socialism, mankind resumes the definite control over the means and instruments of production, and masters them thenceforward for all time instead of being overmastered by them. By such co-operative industry, whose power over nature is increased by each fresh invention and discovery, a carapace of repression is lifted off from the faculties of each individual, and wealth being made as plentiful as water by light wholesome labor, all freely contribute to increase their own happiness as well as that of their fellows. Human nature assumes a new and higher character in a

first carried Unitarian doctrine to Poland in 1546, which afterward became the seat of the denomination. Servetus in 1531 published his first work, *De Trinitatis Erroribus*. In 1532, at Haguenau, he published his *Dialogorum de Trinitate, Libri duo*, and at Vienna, in 1553, his *Christianismi Restitutio*. He was then imprisoned by the Roman Catholics for heresy. Escaping, he went to Geneva, where he was burned as a blasphemer and disturber of the peace. His heresy was neither Arian nor Socinian, but apparently a more consistent assertion of the deity of Christ than that of his enemy, Calvin.

In Italy, where during the preceding century religious faith had been generally superseded among the educated by a semi-pagan humanism, many prominent persons, affected by the religious excitement of the Reformation, adopted rationalistic views. In the second quarter of the sixteenth century, at Vincenza, a small town in the district of Venice, a society existed consisting of persons denying the divinity of Christ and related doctrine. It was dispersed in 1546, previous to which, it is said, Bernard Ochinus and Lælius Socinus joined it. The latter, born in Sienna in 1525, was educated as a lawyer, but devoted his life and great talents to theological speculations. He has been correctly designated "the spiritual father of Socinianism," while his nephew, Faustus Socinus, was "the founder of the sect." He remained ostensibly a member of the Reformed Church at Zurich, although by personal influence, wide correspondence, and extensive journeys disseminating his opinions. He visited Poland in 1551, and again in 1558, and died in Zurich in 1562. His nephew, Faustus Socinus (1539-1604), filled with his uncle's spirit, but with a much more elaborate and consistent system of theology, settled first in Basel, was called into Transylvania to assist Blandrata in his controversy with Francis David, and settled permanently in Poland 1579. After the removal of Spiritus to Poland in 1546, Francis Lismanin, a Corsican monk and confessor of the queen, Bona Sforza, had been converted to Unitarianism in 1551. He was soon re-enforced by Peter Conezius and George Blandrata, a native of Piedmont, who through the influence of Lismanin was appointed physician to the queen. At this time all the Protestant synods held in Poland embraced promiscuously the ministers of all the Reformed societies, whether Lutheran, Calvinistic, or anti-Trinitarian. In 1565 the latter were expelled from communion, and forced to form an independent ecclesiastical organization. The Unitarian Church thus formed comprised persons of very dissimilar opinions. "They all concurred in maintaining the supremacy of the Father, but with respect to Jesus Christ, some thought him to be a God of inferior nature, derived from the Supreme Deity; others held the doctrine of Arius, conceiving him to have been the first created Spirit, who became incarnate with a view to effecting the salvation of mankind; while a third party believed him to be a human being. These last were divided into two classes—the one believing the miraculous conception of Jesus; the other considering him to have been the son of Joseph as well as of Mary." Socinus held that although a man only, he was entitled to divine honors, since his exaltation at the right hand of God and assumption of the government of the Church, while others, pre-eminently Francis David, denied this.

From the advent of Faustus Socinus these various elements were, through his superior genius, wrought into a homogeneous ecclesiastical organization, and brought into substantial agreement with the theological views of his uncle; and ultimately the denomination and system of theology took their historical designation of "Socinian" from these great leaders, but during their earlier history they were called Pinczovians, from Pinczow, the place of their first settlement, and afterward Racovians, from Racow, a town built for them by a Polish nobleman, and their metropolis of learning and influence. They flourished exceedingly for the greater part of a century, converting to their views many of the Polish nobility; they established colleges which attained great reputation, attracting multitudes of Roman Catholic and Protestant youth, and they produced a number of theological speculators and polemics of great learning and ability, whose works attained a vast circulation. In 1563 Blandrata went into Transylvania to attend the prince, John Sigismund II., as a physician, where he succeeded in bringing over to his own opinions Francis David, at that time superintendent of the Reformed churches. These together secured a large following, but the prosperity of the sect was greatly impaired by the bitter

controversy which subsequently arose between Blandrata and David, the former affirming and the latter denying that divine honors are to be paid to Christ. David was condemned by the diet held at Weissenburg in 1579, and died in prison in November following. After a long struggle with their opponents the Socinians were suppressed in Poland in 1658, the centennial of Blandrata's arrival. Those who refused to renounce their opinions went into Transylvania, Hungary, and Prussia, and the majority into Holland, where they were merged with the Mennonites and Low Arminians. Of churches of their order in Transylvania there were 108 in 1887, with nearly 60,000 registered members.

A first catechism was written by George Schoman (d. 1591). Faustus Socinus (d. 1604) left another incomplete. Valentine Schmalz and Jerome Moscorovius produced the *Racovian Catechism*, the standard of the Socinian churches. It appeared in Polish in 1605, and was published in German 1606, and in Latin 1609. An English edition, produced in Amsterdam 1652, was ordered to be burned the same year by the English Parliament. It was again translated and published in English in 1818, with a history of the Polish Socinians by Dr. Thomas Rees. After their expulsion from Poland, Andrew Wissowatius and other learned men, finding refuge in Holland, collected their more important writings and published them in 8 vols. folio, comprising the works of Socinus, Crelius, Schlichtingius, and Wolzogenius; to which a ninth volume has been added, containing the writings of Przypcovius and Andrew Wissowatius, and a tenth volume, containing the works of Brenius. This collection is known as the *Bibliotheca Fratrum Polonorum*.

II. DOCTRINE. 1. *The Scriptures*.—Socinians admit that a supernatural revelation is essential as a means to effect the salvation of men. They regard Christianity as a new law, revealed and executed by Jesus Christ. This revelation is contained in the Scriptures of the Old and New Testaments, and especially in the latter. These are authentic, sufficient, and perspicuous. Yet, as they can contain no elements inconsistent with reason, they are to be interpreted in a sense agreeable to reason; which rule of interpretation in their hands led practically to the conclusion that although containing a divine revelation, and virtually infallible, they contain minor errors.

2. *Theology*.—(1) The divine unity is inconsistent with personal distinctions. (2) Free self-determination is more fundamental in the divine nature than either justice or love. (3) By the act of creating the world, God has voluntarily limited his omnipresence as to his essence, and by creating free agents he has voluntarily limited his power and his knowledge, because free will is self-determined, and future contingent events are not the objects of knowledge. (4) "There is no such justice in God as requires absolutely and inexorably that sin be punished. There is, indeed, a perpetual and constant justice in God, but this is nothing but his moral equity and rectitude, by virtue of which there is no depravity or iniquity in any of his works." (Socinus, *Prælect. Theol.*, c. xvi.) Hence he can pardon any repentant and reforming sinner without a satisfaction to justice. (5) The Holy Ghost is the impersonal power and efficacy of God.

3. *Anthropology*.—The guilt of Adam's sin is not imputed. Man was created naturally mortal, and since the time of Adam has gradually acquired an hereditary tendency to sin, which of itself does not involve guilt. Responsibility is limited by ability. Man, animated by the promises of God, is able to turn unto God; and when he does so turn and believe, God seals his promises more and more on his heart by the Holy Spirit. *Rac. Cat.*, sec. 5, ch. x.

4. *Christology and Soteriology*.—(1) Christ, as to his essential nature, is strictly human, but miraculously generated by the power of the Holy Ghost in the womb of the Virgin. Hence he was from birth without sin. At his baptism he was supernaturally sealed with the Holy Ghost, and qualified and endowed with authority for his office as Prophet, Priest, and King. He was also taken up to heaven and admitted to the vision of God, and instructed in divine things. While on earth he revealed the will of God to his disciples with divine authority. After his death he was raised to the throne of God, endowed with the divine attributes of omniscience, omnipotence, and supreme dominion. He is the rightful object of divine worship and of invocation. He saves his people as Prophet and King, the office of Priest being merged in the other two. He will judge the world at the last day, and raise believers to share in his own glory. (2) As God's justice demands no satisfaction, Christ's death

**DESCRIPTIVE SOCIOLOGY.**—Systematic sociology begins with analysis, classification, and generalization. It is necessary to observe the elements that are combined in social phenomena, to know the conditions under which they are brought together, and to examine the groupings and organizations that result. The elements of society are all included under the term *population*, which must be studied under its outward aspect of numbers, reproduction, increase, density, migrations, and the intermingling of races and nationalities; and under its subjective aspect of sympathies, antagonisms, tolerances, habits, and traits of character. These internal or subjective elements of society are combined in the subjective aspect, or internal constitution, of society itself—that is to say, in the common sympathy and purpose, the accepted tradition, the public opinion, the general will; in a word, in the social mind. Society as subjective, the social mind, projects itself and realizes itself outwardly in an external organization, which is twofold in form. There is a series of groups which are alike in all important respects, and merely repeat themselves to make up the larger aggregates. This series, which may be called the social composition, includes the family, the horde, the tribe, the town, the county, the commonwealth, and the nation. The other form of organization may be called the social constitution. Its basis is a division of labor, and it consists of associations engaged in different activities, some economic, some political, some cultural, but all co-ordinated in one complex system of mutual helpfulness.

**Population.**—The study of population in its outward or physical aspect begins with the facts of aggregation or grouping. Animal life and human population are massed in dense aggregates in certain places, in less dense aggregates elsewhere. Comparatively few individuals among animals or men live strictly isolated lives. This physical aggregation is the indispensable preliminary condition to the evolution of society. That there may be communication, companionship, and mutual aid, there must be propinquity and contact. These are ensured by the unequal distribution of food-supplies, the varying degrees of temperature and moisture, the topography and other physical circumstances, making life in some places easier than in others.

Looking still at the outward facts and neglecting for a time the internal factors of sympathy and social instincts, we observe that aggregation is of two forms. Individuals descended from a common ancestry are often found living near each other in and about the place of their birth, as in an isolated village, whose inhabitants have married in-and-in for generations and have never separated. This may be called a genetic aggregation. Other individuals born in many different places, perhaps in widely remote parts of the world, are found assembled and carrying on their life-activities in one place, as in a great modern city like London or New York. This may be called a congregative aggregation. The patriarchal theory of the origin of society assumed that genetic aggregation was the original form. The social-contract theory, logically carried out, would assume that congregative aggregation was the original form. Actually no large community is a genetic aggregation only, or a congregative aggregation only. The vital and mental energies evolved in regions where resources are on the whole abundant expend themselves not only in maintaining the food-supplies by industry, and in perpetuating population by reproduction, but in ceaseless motion, travel, exploration, and colonizing; while on the other hand, from regions where the life-struggle is becoming severe, population moves to more favored areas where the opportunities are greater. Migration is thus a normal phenomenon. Every community loses in this way individuals born within it and receives individuals born elsewhere. Every community thus has a mixture of population elements, which may be called its demotic composition. At the same time every community except colonies, and new cities in the first generation or two of their existence, is perpetuated mainly by its own birth-rate rather than by immigration. Society, therefore, we may say, is normally autogenous. It is for this reason that the assimilation of the foreign-born goes on with astonishing rapidity, even in a country like the U. S., which received from 1820 to 1890 an immigration of 15,427,657 souls.

Turning to the internal or psychical factors of society, the most elementary phenomena of social psychology are simple activities of feeling, perception, and will that involve two or more individuals, namely: (1) Mutual perception and communication, by motions, tones, or speech; (2) recognition of fellow beings of one's own kind or species as

like one's self and unlike all other objects; (3) imitation; (4) conflict; (5) toleration; (6) mutual aid, alliance; (7) mutual pleasure, play, festivity. These mutual feelings and activities constitute association as distinguished from the merely physical phenomenon of aggregation. An important question to be answered through the study of these phenomena is that of the relation of the social to the individual instincts. The notion which Hobbes converted into a classical doctrine, that individual instincts only are primitive and that "the state of nature" which preceded society was "a state of war," of each individual against every other, is not supported by the results of modern research. Among the lowest forms of life creatures do not prey upon their own kind, but upon other species. Even the *amœba*, a mere drop of structureless sarcodæ, discriminates between fellow *amœbæ* swimming near and such favorite food-objects as desmids and diatoms. This recognition of kind and of accompanying acts of imitation begins when a sentient creature identifies the feeling of touching a fellow creature as like the feeling experienced when it touches one part of its own body with another part. Such feelings can not be associated with nutrition because, even though one pseudopodium of an *amœba* encountering another should coalesce with it, nutrition would not follow. Therefore, at the dawning of consciousness fellow creatures of the same species can not regard each other as food-objects. On the contrary, they necessarily imitate one another in capturing non-related food-objects, since the touch of a moving part of one is to another a stimulus like the touch of a moving part of itself against itself, and starts like motions. Consequently these beginnings of social feelings and social actions are as primitive as the individual instincts. Among the lowest animal forms, as among civilized men, the struggle for food is normally a rivalry or competition rather than a "war."

Under the pressure of scarcity, however, conflict may at any time break out. Cannibalism has doubtless everywhere had its origin in starvation. Toleration is then re-established by force, not by moral feeling, nor by a conscious calculation of expediency. The very strong kill off the very weak. The very strong are overborne by the numerical superiority of the individuals of average power. The latter are too nearly equal for one to hope to vanquish another, and their resulting toleration is an equilibrium of strength, which is tested from time to time, and so maintained, by frequent acts of aggression and revenge. Toleration being established, fellow-feeling, sympathy, and imitation can work themselves out, step by step, with the evolution of intelligence, in the positive forms of mutual aid, alliance, and mutual pleasure. Mutual aid begins in accidental helpfulness and protection, and is perpetuated consciously when its benefits are perceived. Social pleasures are observed among nearly all the higher animals, as among men. Among the birds and the more intelligent mammals infancy and youth are a continuous playtime. In social pleasures the higher sympathetic feelings, which presently become the strongest social bonds, are developed, and the cultural activities are born. Mutual aid is the foundation of political alliance and of economic organization. Toleration is the foundation of justice. Imitation is the foundation of diversified desires and individual industry.

Association reacts on the associated individuals, developing in them a social nature; but owing to differences of circumstance and of heredity the development does not go on equally, or at the same rate, in all parts of the population, and social classes result. In a majority of individuals fellow-feeling, imitativeness amounting to industry, tolerance amounting to justice, helpfulness, and companionableness, are ruling qualities. This class is the normally social. In other individuals these qualities are deficient or absent, but are simulated. Pretending to have the social nature and appealing to those in whom it is real, these pseudo-social characters, if not aggressively anti-social, make up the pauper class. Yet others, whether simulating the social nature or not, having become aggressively anti-social, are the criminal class.

**The Social Mind.**—The foregoing mental and moral elements of society are combined in products which we call by such terms as the common feeling, the moral sense, the public opinion, the general will, of the community, and which it is convenient for the sociologist to name collectively the social mind or the social consciousness; but care is necessary to avoid associating false conceptions with these terms. They do not stand for mere abstractions. The social mind

of a given trade-union are more alike with reference to the purpose which unites them than one trade-union is like another; otherwise the differing members would connect themselves with other unions. The members of a given church are more alike in feeling and belief than one church is like another. The members of trade-unions collectively or of churches collectively are more alike than trade-unions in general are like churches in general. Each association does a specific work; it may be said to have a functional purpose. Combination among associations is therefore a co-ordination, and mutual aid among them is not through mere increase of mass and power, but by a division of labor.

The social constitution is analogous to that of a biotic organism, as Spencer has shown; but the analogy is of limited value for scientific purposes until supplemented by a close study of those features of social organization that are distinctive. Of these the most important is a more perfect actual or potential duplication in the social organization of the organs or agencies for performing every essential function. Though in the animal many vital organs are duplicated, there neither is nor can be any complete duplication of the alimentary, the circulatory, or the nervous system. Public association or the state can at need assume every social function. Voluntary association can do the same. It is as if the cerebral nervous system, on the one hand, had the emergency power to organize from the body-tissues a new alimentary and circulatory system, and the sympathetic nervous system, on the other hand, could at will assume the functions of the brain and spinal cord. This power of public and of private association to assume each other's functions is maintained, because at all times some duplication is in fact kept up in every essential class of social services. The error of attributing to the state defensive and juridical functions only, and to private associations economic and cultural functions only, is being constantly repeated in political and economic writing. The fact is that the state performs always important economic functions of production, transportation, exchange and finance, and cultural functions, religious or educational, and that private associations, such as political parties, political clubs, revolutionary societies, and private tribunals to achieve political or juridical ends, are among the most important voluntary organizations known. The socialists, therefore, are right in saying that the state could, if necessary and desired, carry on all social undertakings, and the individualists are right in saying that society could get on, and in a way achieve its ends, without the organized state; but both are wrong in supposing that either thing will happen under a normal social evolution. The actual distribution of functions between public and private agencies is a varying one, always changing with changing circumstances. Consequently, movements tending to increase public activity on the one hand or to enlarge the opportunities for private initiative on the other hand will be self-limiting so long as conditions are normal. They should be regarded as tendencies toward equilibrium. Whatever belittles the state or destroys popular faith in its power to perform successfully any kind of social service—whatever impairs the popular habit of achieving ends by private initiative and voluntary associations, by so much endangers society, checks its development, and prevents the full realization of its ends.

The supreme end of society is the protection and perfecting of sentient life. The end of human society is the evolution of the rational and spiritual personality of its members. The associations directly concerned in this function are the cultural, namely, the religious, the scientific, the ethical, and the æsthetic, the educational organizations, and what is called polite society. Economic, legal, and political organization exists (in a functional sense) for the sake of cultural organization and activity. The social mind always has perceived this truth, and by means of its sanctions has endeavored to mould the social constitution into accordance with it. Associations and relationships sanctioned by the social mind are known as institutions, and they are fostered or abolished always with a view to cultural as well as to protective ends. For both ends specialization and division of labor are necessary. Society is obliged to tolerate and promote differentiation in its constitution while it maintains the homogeneity of its composition. Psychologically, therefore, the social constitution may be described as an alliance of the like and non-tolerance of the unlike in each simple association, supplemented by toleration and co-ordination of the unlike in complex association—that is to say, in the re-

lations of each association to other associations and to society at large.

**HISTORICAL SOCIOLOGY.**—The stages of sequence in social evolution have corresponded roughly to the four stages of synthesis above described. Concourse, fellow-feeling, social instincts, and mutual aid had their origins in animal society, and it was by means of them that animal life was developed into various types. The first stage of association, therefore, was zoögenic. In the second stage the evolution of speech and the genesis of a varied tradition made the social mind self-conscious, and transformed the anthropoid into man. Society then was anthropogenic. The third stage, in which the social mind, acting on spontaneous forms of alliance, created clan, tribe, folk, and nation, was ethnogenic. In the fourth stage a wonderful development of the social constitution, with division of labor, has made possible a high utilization of resources, a rapid multiplication of population, and a democratic evolution of the social mind. Society has become demogenic.

**Zoögenic association** is as old as sentient life. All biological speculations that ignore the social factor in the struggle for existence are imperfect, and without appeal to it the evolution of animal intelligence can not be explained at all. Long before man appeared on the earth sympathy was highly developed, the art of communicating feelings and simple ideas, by tones and gestures, was practiced by millions of creatures, family relationships were established, and bonds of mutual aid, companionship, and pleasure held together swarms, flocks, troops, bands, and herds. Even the beginnings of tradition had appeared. Association had become the most important defense and help in the life-struggle. The survival of the fittest was the survival of the social.

**Anthropogenic Association.**—Therefore nothing could be more unscientific than a theory of human origins through the evolution of a single pair of anthropoid apes into man and woman. If science abandons the dogma of special creation, it must abandon also the dogma of a first pair. There could have been no continuity of animal and human descent without a continuity of animal and human society. If anthropoid apes became simian men, a whole community or many communities underwent the transformation. John Fiske's theory (*Outlines of Cosmic Philosophy*, Boston, 1874) that the prolongation of infancy, as an incident of the physical evolution of man, by holding the family together for a relatively long period prepared the way for more extended social relations, reverses the probable order of cause and effect. Increasing social intercourse stimulated and developed the cerebral nervous system. Cerebral development entailed the prolongation of infancy, which, in turn, by delaying the use of arms and legs and jaw, altered the proportions of the skeleton and the facial angle.

These changes, it is probable, took place step by step with the evolution of speech and of tradition. Many evidences point to communal festivity, with its attendant rhythmical gesticulation and some approach to song, as the means by which, under the influence of mental exaltation, conventionalized sounds were so definitely associated with feelings and ideas as to constitute the beginnings of speech. (See LANGUAGE.) Industrial traditions had their beginnings among animals. Most characteristic of the beginnings of human society were the primitive explanations and traditions of life, death, and causation, known as ANIMISM (*q. v.*), and the ghost-theory. See also ANTHROPOLOGY.

**Ethnogenic Association.**—There is no reason to doubt that the earliest hordes of men were composed of family groups. Among the higher mammals the troop, band, or herd is subdivided into pairs, families, or studs, and it would be astonishing to find that the same thing was not true of the primitive hordes of men. At the same time the relations of the sexes may have been of the loosest description. Writers on the history of marriage have too often made the mistake of assuming that the two things must be inconsistent. The living together of man and woman does not always preclude irregular indulgence on the part of either. Festival occasions are still, in many parts of the world, opportunities for conduct closely approaching promiscuity by men and women who, none the less, live habitually in family relations. The trading of wives also, and the lending of wives to guests, are customs of friendship and hospitality in many communities.

It is probable, further, that, as a rule, the domestic group was a simple pairing or monogamous family, in which male jealousy and power played the important part ascribed to

born by Hester, and her Henry Sumner. Maria, and Orestes, and Joseph, were exceptional descendants from the same type. The city and its political polity is made of the fact that primitive knowledge, more or less correct, and the attempt to explain it by the stability of parents. Another explanation is quite as good. A family established in the future is representative of the second and distinct and is a common power is all-sided the moral the same three generations and America here. Her offspring, knowing only the mother that came for them, will take her name. The original family name were commonly of such kind. American and Colonial by an in consequence is extremely probable. — See *Monks*.

The faculty, as a rule, was exemplified, that is the sense ascribed to make sense from rather fundamentally confused and even opposing these elements. This is a paradox that kind the Americans in national life, as Westcott took him shown, and were better suited for the influenced necessity upon things and positions supplemented by cultural education. When some bodies stand in such proximity that some intercourse, usually or for the is possible the preference may extend to the women of other bodies, and especially if the practice of intimacy there by force. Such an intimacy seems them to be proved as trophies of prowess of cunning. The bodies, then, like the bodies, may become argument.

Brothers and sisters, to those are a natural property-holding and defensive group, spontaneously holding each of her to each weapons inflicted by other groups. To pursuing its share in and redressing its wrongs, it seeks the aid and protection of supernatural power. In the animal stage of nature, some animal object, plant, or animal, which is regarded with superstitious veneration, becomes the special champion of the household. Believing that a mysterious blessing can be established through touch, by tribulation and suffering, and to the members of the fraternal circle do not doubt but that they can become akin to the object of their worship, and to camp can that they always bear its protection with upon their instincts or touch themselves or their clothing or belongings with a sign of trade, mouse of the animal object. From every practice of the kindred circle is thought of as supported by the totemic deity, and any deviation from established custom is looked upon as a wrongdoing, which is punished by dire penalties. In this way exogamy becomes a tender obligation and hence a sin.

I am a young person, much like the fraternity of uterine brothers and sisters in one, in succeeding generations is likely to have the same fraternal duty, but sooner or later, under the influence of their mother and her relatives, or through reasonings that there are dissonances from their mother's uterine duty, a circle of brothers and sisters is sure to adhere to the mother's notion and worship, instead of adopting a new one. I have cited in regard to the Gnostic circle, begins to enlarge. In this married generation it necessarily includes brothers and sisters, mothers, daughters and sons, uncles and aunts, and we, wives and mothers. Since kinship is replaced through mothers but not through fathers, the circle will be so small outside the children born of its daughters, and not of sons, those begotten by its sons. Children of sons and daughters in the kinships of their mothers; and since in the household marriage has become superlatively associated with kinship, worship, and what was originally an ancient law dissolved into the idea that men must not take wives of their own tribe, the wider kinship circle also must be recognized. The kindred has become a nation.

Though the clan can never be perfectly identified with the house, and if considering houses as exogamous each clan will have members in several different houses, there are no more in which a majority of the members of a house are belonging to the same exogamous clan. Men may go out in the totemships of their wives' totem-matings. In the same communities with their children and unmarried male relations may live together in one place, and their houses, belonging to many different clans, will be an unimportant element. If, however, men stand or buy their wives' land inheritance, when they follow the residence of the husband, the children of a polygynous clan will be dispersed through many houses and each house will be made up of members of many clans. Nevertheless it may happen that to several clans and their children's rights in such polygyny a house pattern house that do then always tending toward unity, and, also house. A cluster of neighbouring houses are then be founded and into a matter of house clans.

When caught among plan borders draw together into a trilateral symmetry, the lines of demarcation between borders are

which may disappear or come to have importance, while the changing lines remain strongly defined. Composed of families, the tribe is a small unit of close, mutually dependent human coexistence. At its top, becoming increasingly dense, the tip of the cone of vertical unity meeting processes in the phylum, is a fraction of a tribe. It is a tribe subdivided into much from each of its elements into new tribes. The kinship is the essential organization of the community, developing and handing it its economic tradition. The phylum is the religious organization guarding the religious traditions. Its sacred events of each season are the work of a priestly and professional class. The clans are the political organization, developing and applying a customary law which regulates property rights, marital rights and limitations, feuds, and vengeance. The sachems, elected to coordinate the clansmen, are the first priests and judges. The tribe is the military organization. It cannot be composed of the leaders or chiefs of the voluntary war parties put forward by each clan. In the tribal society a military tradition is evolved. True political organization becomes only when tribes confederating by one folk or ethnic nation. Then for the first time the political power and the military power are combined in one governmental system, as different representatives of a single society.

Patrilineal societies exhibit the same forms and stages of organization as matrilineal, with the exception of differences that necessarily follow from kinship through fathers. The change from mother-kinship to father-kinship may occur at any stage of social integration, in the family or in the folk. It is effected by economic circumstances or conflict. In the family can survive only through the industry and protection of the father, as among the Hopis, who depend on the arid lands and dangerous slopes of the mesas; it will hold together long enough for children to grow up under paternal authority and take the father's name. When under different conditions wealth is lost, and herds begin to be important, men appropriate it and desire to transmit it to sons instead of to sisters' children. Patrilineal kinship prepares the way for toads in culture from animism to ancestor worship, which in turn greatly strengthens paternal power. With land marriage and patrilineal kinship the folk and the clan can become nearly identical, compact, and powerful. In herd, clan, and tribe chieftains can become hereditary. Chieftains can become the founders of a nobility, and the chief military leader of a folk, becoming a true king by making supreme religious and judicial authority with his military functions, can found a royal family. Kings and chieftains receiving from their followers large shares of the booty of war, and privileges in the tribute land, enrich their families, who in turn, according to themselves the broken and ruined men of shattered clans and tribes, become the "own noblemen" and systematic maintainers of that barbaric feudalism which in time seriously undermines the kinship or gentle organization of society and prepares the way for another system. See, further, *Evolutionary*.

*Demographic Association.*—In ethnogenic association the social constitution is incidental to the social composition. In demographic association the state has become a proper. It subordinates and rearranges the social composition and perhaps the social constitution.

A tribal confederation seldom establishes itself permanently upon the territory where it originates. It moves on to conquer richer regions, and, if successful, reduces their inhabitants to slavery or serfdom. Increasing then in wealth, it attracts to itself slaves from far and near, who presently become so large an element in the population that it is no longer possible to organize local and military administration on the clan and tribe basis. Legal rights and membership in the state are made to depend on one's name only within territorial limits. Separate centers upon civilization.

Evolution exhibits three stages. Egypt and Babylon did not go beyond the first, Greece and Rome did not complete the second. The modern West has not even entered fully upon the third. In the first stage all the energies of society are concentrated upon the task of political organization and defense. To this everything else is sacrificed or subordinated, and government is absolute. This work completed, the liberal natural energies expand their lives in science, in the struggle for personal freedom, and in the effort to combine liberty with stability through the constructive evolution of material and constitutional law. Greece failed in her second, Rome in her third, and the West is still in the second.

spontaneity to system. The civilizations of Greece and Rome, like those of the Eastern nations, were unstable, because they were surrounded by a worldwide environment of barbarism and savagery. The modern Western civilizations are stable because they simultaneously grew to great and powerful statehood in an environment of civilization, which for ages had lain between them and the more remote barbarism of Africa and Asia. Consequently there was no necessity for an extreme sacrifice of personal initiative and the lesser interests of life. The second stage also with them was no partial evolution. The Renaissance, the Protestant Reformation, the American and the French revolutions were but so many phases of a thoroughgoing criticism and reconstruction of the social constitution on lines of legality and free association. By means of this strong but elastic union of voluntary and flexible organization with law, the magnificent development of modern industry and a consequent multiplication of population without parallel in history have been made possible.

Spencer's generalization that societies are military or industrial in type is therefore neither adequate nor altogether accurate, in the form in which he has stated it. Militarism and industrialism are stages rather than types, and between them lies the stage of critical and legal reconstruction, which is the cause, rather than the effect, of industrial evolution.

The development of the fundamental social interests thus reverses the order of their genesis. Society is first economic, then juristic, then political. Perfecting then the political system, it works back through law to the economic foundations. Not so in its cultural interests. The order of their genesis—religious, scientific, ethical—is the order of their development. The political era is also the great religious period; society is theocratic. Then the social mind goes forward to critical and scientific activity while it applies itself to legal construction, and it is only by the aid of science and criticism that legal construction is accomplished. Finally, when it works back to industrial problems it advances to a serious study of ethical principles and ideals, and only as it does so can it hope to adjust the complicated relations of economic life. Future society, increasingly economic, will be also increasingly ethical.

**EXPLANATORY SOCIOLOGY.**—The details of explanatory sociology are yet to be worked out, but certain principles are established. The interpretations of social structure and evolution must be in terms of natural causation; but psychological phenomena, no less than physical, are natural, and society must be explained in terms of motives and choices, as well as in terms of outward forces.

The initial causes of society are physical. Aggregation and association are brought about by geographical and organic conditions; but association furthers survival and happiness, and the associated individuals, becoming consciously and fully aware of the benefits of society, attempt to defend and improve it. The unconscious natural process thus becomes conscious and artificial. Relations and activities are valued, choices are made, policies are devised, and institutions founded. The process does not end here, however. Natural selection works among policies, laws, and institutions, as among individuals. Some fail to benefit the community, and disappear. Those that survive are not always the ones that were supposed to be most promising at their inception.

The further task of sociology, therefore, is to discover the details and laws of these complicated processes. It must try to formulate, first, the laws of the purely physical and unconscious causation that occurs in society; second, the laws of conscious social choice; and, third, the laws that govern the natural selection and survival of arrangements, laws, and institutions.

Society has often been described as an organism. Being essentially psychical it is more and higher than an organism. It is also more than a multitude of individual minds. It is a psychological organization of conscious organisms.

Maine, *Early History of Institutions* (London, 1875) and *Early Law and Custom* (London, 1883); Westermarck, *History of Human Marriage* (London, 1891); Fustel de Coulanges, *La Cité antique* (1864; Eng. trans. Boston, 1873); Smith, *Kinship in Arabia* (London, 1885). FRANKLIN H. GIDDINGS.

**Socorro**: town of Colombia; in the department of Santander, of which it was formerly the capital; on a plateau, 40 miles S. S. W. of Bucaramanga; 4,120 feet above the sea (see map of South America, ref. 2-C). It was founded in 1540 on the site of an Indian city, and was removed to its present site in 1681. In 1781 it was the center of a formidable revolt, and it was the first place in New Granada to declare for independence in 1810. Hand-woven mantles and "Panama" hats are exported. Pop. about 18,000. H. H. S.

**Socorro**: city: capital of Socorro co., N. M.; on the Rio Grande river, and the Atch., Top. and S. Fé Railroad; 75 miles S. by W. of Albuquerque; 178 miles N. of El Paso, Tex. (for location, see map of New Mexico, ref. 12-R). It is engaged in mining and smelting gold, silver, and lead, raising cattle, sheep, and goats, agriculture, fruit-culture, and lumbering; and contains 6 churches, 3 public-school buildings of brick (cost \$25,000), State School of Mines (cost \$50,000), 2 national banks with combined capital of \$100,000, and 2 weekly newspapers. The city has an excellent climate, that is highly recommended for persons in the early stages of consumption. When discovered by the Spaniards, the site was occupied by an Indian pueblo. The place was settled by Franciscan fathers, was destroyed and abandoned in 1659, and was again settled in 1765, 1794, and 1804. Pop. (1880) 1,272; (1890) 2,295; (1895) estimated, 4,000.

W. S. WILLIAMS, EDITOR OF "CHIEFTAIN."

**Socotra**: an island in the Indian Ocean, off the eastern coast of Africa; in lat. 12° 39' N., lon. 54° 1' E., 140 miles N. E. of Cape Guardafui; controlled by Great Britain. Area, 1,884 sq. miles. The interior of the island is mountainous, and mostly unproductive, on account of insufficiency of water, the streams drying up completely at certain periods, but the coast-land, generally from 2 to 4 miles broad, is low, level, and fertile. The island produces good tobacco and dates and the best aloes known, and has superior sheep and goats. There is considerable trade with Muscat. The climate of Socotra is more temperate than that of the adjacent continent. Pop. estimated at 10,000, mostly Arabs, Negroes, and descendants of Portuguese.

Revised by M. W. HARRINGTON.

**Socrates**, sok'rā-tēz: philosopher; son of Sophroniscus and Phanarete; b. at Athens in 470 B. C. (or 469, in May or June); drank the cup of poison 399 B. C. (in April or May?). His father was a sculptor, and Socrates in his early years worked at the same occupation. He alludes to his mother (*Theaitetus*) as a midwife, and likens to her art his own skill in drawing out ideas by conversation. In his youth he learned geometry and astronomy and practiced gymnastics. He is reported by Plato (*Phaedo*) as having studied the work of Anaxagoras on *Nature*, probably under the instruction of Archelaus, the disciple of Anaxagoras; and according to Xenophon (*Mem. I. and IV.*) he had a critical knowledge of the writings of the early wise men, as well as of the Ionian school of philosophy. He probably met Parmenides when about twenty years of age, and mastered the Eleatic view of negative dialectic (which proved its theories by showing up the contradictions of its opponents), and was thoroughly instructed in the doctrine of the Sophists—possibly may have received direct instruction from Prodicus. It is said that having early lost the patrimony inherited from his father, the wealthy Crito assisted him in his education, and employed Evenus to instruct him in poetry, Theodorus in geometry, and Damo in music, and that the celebrated Aspasia had a share in his culture. He married, and had three sons. Xantippe, his wife, has come down in history as the typical scold. Socrates is represented as using the violence of her temper as a means of cultivating his patience. He took part in three military campaigns with his fellow citizens—that of Potidæa (432 B. C.), wherein he saved the life of the young Alcibiades, who was wounded; that of Delium (424 B. C.), in which he saved the life of Xenophon, and himself received assistance against his Boeotian pursuers from Alcibiades in the disastrous retreat which followed, and wherein his own cool bravery was conspicuously manifested; and that of Amphipolis (422 B. C.). He proved himself to have an extraordinary capacity to endure cold, heat, and fatigue. He walked barefoot upon the ice and snow of Thrace in his usual clothing, while others were clad in furs. By this time he had become noted for his peculiar mode of instruction by means of conversations which he held with people of all classes at the public resorts. Aristophanes in *The Clouds* held him up to ridicule as the arch-Sophist, as a dreamer, morally worthless and physically incapable (as Grote re-

The pungent protestations upon the character of Societies are not unappreciated. That of Abolition in England has occasioned to perhaps the times, that of Non-Resistance more color and sympathy: "Knowing him to be such a man as I have, the world—no pains toward the gods as man to undertake anything without first consulting them, so put toward men as never to do the slightest injury to any one, while he considered the greatest benefits on all who came in contact with him, as temperate and kind as never to prefer pleasure to what was right, so was as true to our as just to all of good and evil, not missing the need of others in order properly to discharge his duties toward them, so able to share his joy and completely sharing the sorrows we have mentioned, so glad to be participating the brother's sorrows of men, and among the friends him to promote the virtue and good then to the posterity of virtue. I can not but regard him as the most excellent and happy of mankind." The sources of information as to his life are Xenophon's *Memorabilia*, Plutarch's

works, especially the *Apology*, *Phædo*, and *Symposium*; Aristotle's *Metaphysics* and *Ethics*; Diogenes Laërtius (book ii.); and, among others of modern writers, the essays of Schleiermacher, Boeckh, Van Heusde, Hegel, Forchhammer, Brandis, Röscher, and Grote are important. Zeller's *Socrates and the Socratic Schools* is the best work accessible in English.

WILLIAM T. HARRIS.

**Soda** [from Ital. *soda*, liter., fem. of *sodo* (collat. form of *solido*, solid) < Lat. *solidus*, collat. form of *solidus*, solid]: in chemistry, a hydrous oxide of the metal Sodium (*q. v.*),  $\text{Na}_2\text{O}$ ; in commerce, however, the compound formed by the action of water upon this oxide, and generally designated, even by chemists, hydrate of soda or sodium hydrate. The carbonates of sodium also are often called soda commercially. Sodium hydrate,  $\text{NaOH}$ , or caustic soda, is prepared commercially from the carbonate by the action of lime. Three parts of crystallized carbonate (*sal-soda*) are dissolved in five times as much boiling water, and one part of quicklime, slaked and mixed to a cream with three parts of water, is gradually added, with continued ebullition. The caustic solution is then decanted after settling, and boiled down rapidly with the access of air. From the residue pure caustic soda may be dissolved out by alcohol, which is then distilled off; but for most commercial, manufacturing, and medical uses the residue is merely melted and cast into sticks, which are preserved in bottles. Much caustic soda is also made by heating or boiling together the Greenland mineral cryolite with hydrate of lime. The compound is white, opaque, crystalline, and melts below incandescence. It is used largely, in the form of solution or soda-lye, for making soap.

Revised by IRA REMSEN.

**Soda-ash**: crude soda, as first produced before having gone through any refining processes. Previous to the French Revolution of 1789 the only source of the alkali-soda was from the ashes of marine and seashore plants, or kelp. The trade in kelp ceasing during the Revolution, the Committee of Public Safety in France called upon chemists to find some new source of soda, all the potash attainable being needed for gunpowder. Nicolas Leblanc, a surgeon and chemist, obtained the prize offered. His method consists in converting common salt first into sulphate by means of sulphuric acid, and then heating this together with charcoal and carbonate of calcium, which gives (theoretically) a mixture of carbonate of sodium and sulphide of calcium. This process is carried on, particularly in England, on an enormous scale in many large chemical works, all the soda used for making soap, glass, and a multitude of other products indispensable to civilization being thus procured. For details of the process reference must be made to the standard works on chemical technology, as, for example, the *Dictionary of Applied Chemistry* by T. E. Thorpe.

The crude soda-ash, sometimes called black ash, as it leaves the furnace is a very complex mixture of substances, containing chiefly, however, carbonate of sodium, caustic soda (hydrate), carbon, carbonate of calcium, and sulphide, or, according to some, oxysulphide, of calcium. It is treated with hot water or steam on a furnace-hearth to break it up, and then the carbonate is leached out with hot water in an ingenious apparatus contrived to accomplish much work with little water. The great defect of Leblanc's system as originally carried out was the loss of all the sulphuric acid or of the sulphur used in making it. Hence other methods of obtaining carbonate of soda from salt have been much sought after. One in successful operation, known as the Solvay or ammonia-soda process, consists of decomposing concentrated brine with a strong solution of bicarbonate of ammonia, which engenders chloride of ammonium and nearly insoluble bicarbonate of soda. The chloride of ammonium is readily reconvertible into bicarbonate, to be used over again. With respect to Leblanc's method, however, it may be noticed that by Chance's process, patented in 1888, the sulphur can be economically recovered from the exhausted black ash. Soda is manufactured to a limited extent from the Greenland CRYOLITE (*q. v.*). Revised by IRA REMSEN.

**Soda-water**: See AERATED WATERS and SOLUTION.

**Sodium** [Mod. Lat., from Eng. *soda*. See SODA]: one of the elements of matter, a very important and remarkable metallic substance which was first obtained in 1807 by H. Davy by the electrolysis of caustic soda (hydrate). Its occurrence in nature is chiefly as common salt (chloride of sodium) in the ocean, and as a constituent of silicates, chiefly the feldspars albite and oligoclase, on the land. It is also found in natron, an impure sodium sesquicarbonate, con-

taining besides sodium sulphate and chloride. A cubic foot of ocean-water contains about 6,440 grains, not far from 1 lb. avoirdupois, of metallic sodium, and a cubical tank 14 feet on each side filled with sea-water will contain more than 1 ton of this alkali-metal. A cubic foot of rock-salt contains over 52 lb. of sodium. Sodium is a metal probably more abundant in its occurrence than iron, and probably not necessarily much more difficult or expensive to obtain in approximate purity than the latter metal, and yet, by reason of the fewer uses developed for it, the cost of sodium is much greater than that of iron. Sodium is one of the elements most essential to animal life, being a constituent of all blood. It is also found in the vegetable organisms that dwell in the ocean and along its coasts, but plants dwelling on land above the sea-level contain potassium more abundantly than sodium.

**Preparation**.—Gay-Lussac and Thénard first prepared sodium in quantity by the action of metallic iron at an intense heat on fused caustic soda, but a much better method is that of Brunner, which consists in distilling a mixture of charcoal and carbonate of sodium, the transformation being essentially as follows:

a current of carbonic oxide gas resulting, which sweeps along with it the metallic sodium in vapor. The latter is condensed by passing the gases through a thin, flat cast-iron condenser of peculiar form, which becomes, and remains throughout, hot enough to prevent the metal from solidifying within it, and thus clogging it up. It is so contrived also that a sharp-pointed iron rod may be driven in through it into the retort to clear it out when in danger of choking up and thus leading to a dangerous explosion. The sodium trickles out of the condenser in melted form, and is prevented from taking fire and burning in the air by being received in a vessel of melted paraffin. The vessel should be double, each part having a close-fitting lid to be applied in case the paraffin should kindle. Care must be taken that the carbonate of sodium and charcoal are free from silica and phosphates, which energetically attack the iron of the retort and perforate it from the inside. Deville introduced the admixture of powdered chalk with the mass, to prevent its passing into liquid fusion, but this may introduce silicates, and an excess of coarsely powdered charcoal has been used instead.

A method for the preparation of sodium on a large scale has been devised by Castner. This consists essentially in the reduction of sodium hydroxide (caustic soda), by heating it with an intimate mixture of finely divided iron and carbon. The mass is prepared by mixing the iron with molten pitch, allowing it to cool, breaking it into pieces, and heating to a comparatively high temperature without access of air. The reaction is believed to take place as represented in this equation:

Sodium is a brilliant silver-white metal, of the softness of wax within the normal range of temperatures, but becoming somewhat harder at 20° below zero. It melts at 204° F., and has the specific gravity 0.972 at 15°. It crystallizes in octahedrons of the dimetric or tetragonal system. Its vapor, unlike that of potassium (which is green), is colorless. When exposed to the air, it rapidly absorbs oxygen, and moisture if present, forming either anhydrous oxide ( $\text{Na}_2\text{O}$ ) or caustic soda ( $\text{NaOH}$ ). When water touches it, there is an intense reaction, with evolution of hydrogen gas and caustic soda. If the quantity of water is small, the heat produced is so high that the metal takes fire, and burns with a yellow flame and high heat.

In the preservation of sodium it must be kept immersed under the surface of some liquid which is free from oxygen, the heavy oils of coal-tar being better for this purpose, apparently, than rectified petroleum, which seem to absorb oxygen slowly and transmit it to the sodium, which thus becomes soon encrusted with a product not yet examined. The addition of a small percentage of amyl alcohol to the oil prevents tarnishing of the metal.

**Sodium Salts**.—The most important salts or compounds of soda are the acetate, borate, carbonates, hypochlorite, hyposulphite, nitrate, phosphates, silicates, sulphate, sulphite, and tungstate. *Acetate of Sodium*.—This is a commercial article, prepared on a large scale by the manufacturers of wood-vinegar or pyroligneous acid. It is a white salt in prismatic crystals, which effloresce in the air, soluble in three parts of cold water. Heat converts it into a mixture of carbon and carbonate. It is used in medicine and as the source of com-

conquering Fulbe long ago imposed their rule and the faith of Mohammed upon this and other vast regions in the Sudan. It is one of the most densely populated parts of Africa. Trade and manufactures are well developed, particularly the fabrication of leather goods, cotton cloths, and weapons, but the chief industries are agriculture and cattle-raising. To Sokoto proper belong many tributary states and districts, the largest of which is Adamawa, S. of the Benue river, besides Yakubu, Saria, Kano, Muri, Katsena, and Samfara, all of which pay annual tribute to the sultan. Here the slave-trade flourishes. A small standing army, chiefly cavalry, is maintained. The capital, Sokoto, has only about 30,000 people, and is less important in population and trade than several other towns, notably KANO (*q. v.*). C. C. ADAMS.

**Solana'ceæ:** See NIGHTSHADE FAMILY.

**Solan-geese:** See GANNET.

**Solanine** [from Lat. *solanum*, nightshade]: a natural organic alkaloid found in the black nightshade, potato, bittersweet, and other species of *Solanum*. The alkaloids obtained from these different sources are probably not exactly the same. Solanine is a solid crystalline substance, readily soluble in alcohol. It is very poisonous, producing paralysis of the lower extremities before death, as has been seen in cattle poisoned by eating the green shoots of potatoes, which contain solanine largely. Revised by IRA REMSEN.

**Solano:** See SIMOOM.

**Solanum** [Lat., nightshade]: a genus of herbs and shrubs of the family *Solanaceæ*, most or all of which contain the poisonous principle solanine. The U. S. has several native species, mostly southern. There are a great many tropical species, some of them of great use in local therapeutics, though none is extensively employed in the medical practice of civilized lands except perhaps the *Solanum dulcamara*, or bittersweet. Several afford edible fruits, that of the egg-plant (*S. melongena*) being the most important. See NIGHTSHADE FAMILY. Revised by CHARLES E. BESSEY.

**Solar Cycle:** See CYCLE.

**Solar'io, ANDREA, da** (called also *Andrea Milanese*): painter; b. at Solario, near Milan, Italy, about 1460. His method of painting indicates that he was influenced by Leonardo da Vinci, but nothing positive is known as to his teaching in art. He spent the years 1490-93 in Venice with a brother, Cristoforo, surnamed Il Gobbo (the hunchback), who was an architect and sculptor. In 1495 he had completed for S. Pietro at Murano an important altarpiece of a Holy Family with St. Jerome, now at the Brera at Milan. In 1507 he was decorating with frescoes for Charles d'Amboise the chapel of Château Gaillon in Normandy. Morelli supposes that Solario visited Flanders during the two years of his stay in Normandy, as his pictures have characteristics resembling those of the Flemish school. Andrea Solario died some time after 1515 while painting for the Certosa of Pavia an *Assumption of the Virgin*, now in the sacristy there. His best-known works are an *Ecce Homo* and a *Respose in Egypt* in the Poldi-Pezzoli Gallery at Milan, dated 1515; a *Vierge au Coussin vert*; a bust-portrait of Charles d'Amboise; a *Crucifixion* dated 1503; a *Head of John Baptist in a Charger* at the Louvre; and two portraits in the National Gallery of the London, both on panel. This painter is sometimes confounded with another Andrea di Milano, called Salai or Salaino, a pupil of Leonardo. W. J. S.

**Solar Parallax** [*solar* is from Lat. *solaris*, belonging or pertaining to the sun, deriv. of *sol*, sun]: the difference of the directions in which the sun is seen from the surface and center of the earth. (See PARALLAX.) The problem of determining the solar parallax is identical with that of measuring the distance of the sun, and has justly been called one of the noblest in astronomy. Attempts to estimate the distance of the sun were made even by the ancient astronomers Aristarchus and Ptolemy, but they were necessarily futile, since no observations they were able to make would measure so small a quantity as the parallax of the sun. Still they thought they measured the distance, and found it to be 1.210 radii of the earth. It is remarkable that even had the sun been as near as this, its apparent size would show its real diameter to be more than five times that of the earth. As soon as accurate observations were made with the telescope, it was found that the sun had no such parallax as it would have were its distance only 1,200 radii of the earth. At the time of Newton all that was known of the solar parallax was that it must be immeasurable with the instruments then at command.

To understand the modern solution of the problem, we must see how it presented itself to astronomers after the laws of the celestial motions were established. Imagine the sun with its retinue of eight large planets, the earth being one. As the earth revolves around the sun, astronomers see other planets in various directions, and can thus determine the annual parallax of each. In this way the ratios between the different orbits admit of very exact observation, and a more exact determination by Kepler's third law. Thus there is no difficulty in making a map of the solar system in which all the orbits shall be laid down on the same scale. Without any knowledge of the actual distance of the sun, it can be said that if the distance of the earth be represented by unity, then that of Venus will be represented by 0.72333, that of Mars by 1.52369, that of Jupiter by 5.2028, etc. It follows from this that if any one of these distances can be determined, or even the distance of Venus or Mars from the earth at any moment, all the other distances will follow, including that of the earth from the sun, just as the knowledge of a single distance on a map will give the scale of the map. It will also be readily understood that the nearer a planet comes to the earth the greater will be its parallax, and the more easily will its distance be determined. Moreover, observations on the position of a planet can be made with much more accuracy than on the sun. Thus French astronomers of the seventeenth century saw that if the apparent position of the planet Mars among the stars could be carefully observed from two distant points of the earth's surface, its parallax, and thus its distance, and the distance of the sun, could be determined. An expedition was sent for this purpose to the colony of Cayenne in South America, to make observations of the position of Mars during the opposition of 1672. Corresponding observations were made at the Paris Observatory. By a comparison of all the observations, Cassini computed the parallax of the sun to be 9.5". The error of this result is only about one-twelfth of its entire amount, so that this may justly be regarded as the first actual determination of the solar parallax. The corresponding distance of the sun would be 21,600 radii of the earth, or about 85,000,000 miles.

In 1849 Capt. James M. Gillis, of the U. S. navy, who was afterward superintendent of the Naval Observatory, made an expedition to Chili, for the purpose of observing the parallaxes of both Venus and Mars; but the two oppositions of Mars which occurred while he was there were not favorable, the planet being too far from the earth, and in addition to this the corresponding number of observations were not made in the northern hemisphere. No satisfactory result could therefore be reached.

Attempts to determine the parallax of Mars were not made between 1672 and 1849, because it was supposed that a much more accurate parallax could be determined by observations on transits of Venus. It occurred to Halley, the English astronomer, as far back as 1677, that the time required by the planet Venus to cross the disk of the sun in transit would be different at different parts of the earth, owing to the effect of the parallax of the planet. It was necessary, however, to wait nearly a hundred years for an opportunity of making such an observation, as no transit of Venus occurred from Halley's time until 1761. Then a transit occurred, and another in 1769. Expeditions to the southern hemisphere were sent out by various European nations, and these transits were observed wherever astronomers could see them. The results, however, were found to be much less accordant than had been anticipated, and the uncertainty of the observations thus shown was so perplexing that more than half a century elapsed before the results were definitively worked up. The German astronomer Encke, from an exhaustive discussion of all the observations, reached the conclusion that the sun's parallax was 8.5776", a result now known to be too small by about 0.20".

It is now found that the most accurate measures of the parallax can probably be made on the small planets between Mars and Jupiter. It is true that these bodies do not come so near the earth as either Venus or Mars, and the quantity to be measured is never so large as in the case of these planets; but this defect is more than compensated by the extreme accuracy with which the measures can be made. Dr. David Gill, astronomer at the Cape of Good Hope, has brought this method into use with great success.

Modern science has shown that there are other methods of determining the sun's distance and the dimensions of the solar system besides that of actually measuring the parallaxes of the planets. One of these consists in determining

the velocity of light. The photoelectron of aluminium shows that there is a certain time, between the absorption of light and the emission of the electron in its orbit. This time, which is not the velocity of light, is a finite time, some thirty times that of the time it required the sun, and from this it can be seen that light takes some 495 oscillations from the source to the earth. It is known that if you do not know your distance, neither past nor in field trials, the distance of the star can be ascertained by multiplying this number by 495. Some astronomers have actually been really well, as they are called, possessed of this number. Unfortunately, the number of oscillations that you have is multiplied with an increasing accuracy, owing to the increase in the size of the waves of frequency, as usual, a quantity, and especially owing to the fact that frequency tends to multiply itself (as it is multiplied by distance).

There is a third aspect of determining the true distance to be used in the theory of gravitation. The nature of the problem is changing the method of the measurement of the earth will be equally difficult, according to its distance. The difference is such that the impossibility of direct base purposes is the most important reason away from this method, but this is not a very difficult to determine. It is the variation of the true distance away to be made near the first and second points of the earth. Having the different ways in which the force of the sun falls on the surface of the earth, it is not possible to compare with each other, and that is a very important conclusion and least completely eliminated.

It has been pointed out in the attempt to find the distance of the stars in the spectrum series with the same group that the stars in a series, which gave rise to a number of some of the properties, 100,000,000 and more, is in the middle of the

but that Planché published his unpublished works in the years of 1794 and 1799 in which he concluded that the work's morality was excellent.

by 1940. However, toward the end of the war, the nation's economy in the United States was too small. He did not want a country as big as the United States to be the exact opposite of the international world that it then had created. He decided the economy to be small.

In 1978, in Ayrton, long observations of the sky, found the redshift  $z = 0.07$ .

In 1902 observations of M<sub>10</sub> were made at several of the "Tring" observatories in Andromedae. From a comparison of some of these, Strom found a parallax of 8.90" and even stars made at Padua and the Cape of Good Hope. Wirtz also derived 8.00". The close agreement of these results with those of Hansen and Le Verrier led to a general belief during subsequent years that the true value of the parallax was in fact 8.00" and 9.00".

In 1405, Neveuskiy discovered all the observations of Mars made in 1392, and combined with the result a revision of the model of Hansen and Le Verrier. His conclusion was that in the then state of astronomy the most likely value of the parallax was 0.8". This result was so much smaller than before, that it was considered with distrust but it was not altogether contradicted by the mutual phenomena of the U. S. G. S. G. S. and Great Britain. In 1877, however, Gill, of England, made the well-known expedition to American island, the Lick Observatory, to Mars, from which he concluded that Neveuskiy's result was much too large, and that the parallax was 0.78". About the same time Sir George Airy suggested that the British observations of the transit of Venus in 1874 gave the extremely small result of 0.70".

Research carefully examined several other groups in which these results appeared (e.g., Bartsch et al., 1990), and failed to also provide evidence that the source of the procedure (dependent on whether 1, 2, 3, or 4, etc.) was a factor. This is true in natural conditions (e.g., the number of friends that a child has) or in the lab (e.g., a number of children in a classroom) as well as in the laboratory.

**Solar System:** the sun and the bodies which revolve around it as they revolve around it. The main feature of the system is the sun, the mass of the central body, which is between 90 and 100 times the total mass of all the bodies which revolve around it. The relative arrangement of the principal bodies of the system, which are the sun and the planets, is fairly regular, progressing outwards, and generally in a circular orbit, and the composition of the system is the same as the other bodies of the system, the most fixed part being about 2400 times the mass of the hydrogen gas.

[illegible]

1. The great central body, the sun.
2. The four inner planets: Mercury, Venus, the Earth and Mars.

2. A group of several hundred named plants is considered revealing in the study of Man. It is impossible to say how many known plants are in this group; the number known is more than 100,000 (see Appendix).

4. The four outer planets Jupiter, Saturn, Uranus, and Neptune. These, with the four planets just named, equalled one *terrestrial*.

5. Through some satellites revolving around the planets, of which our planet is the earth, we may find in Mars, first, in Jupiter, second, in Saturn, fourth, Venus, and one, in Neptune.

The flame may be added an unknown number of common salts, many of which may be considered as belonging to the system, and some reasonable number of elements possible. In addition, there is the presence of a solid substance, which is the combustion of the solid, the atmosphere, forming a solid, the solid.

I concluding these lectures to the order of their reasons and influences upon other bodies, the first place must, after this, be assigned to the right major planets. The principal features of the orbits of these bodies are the more approach to circles, and the fact that they lie nearly in the same plane. The most remarkable of their orbits is that of Mercury: yet the eye would scarcely discern its deviation from a circle, though it could readily perceive that the sun was not situated in the center of the circle. It is also the planet whose orbit is most inclined to the ecliptic, the inclination being 7°. See PEARCE and FRISBY, and the names of the several planets.

The principal elements of the plasticity ability are shown in the following table:

TABLE 10. THE PLASMA-CELL ELEMENT.

*Ant. Timpone from a more complete description of*

the same way made from observations of the velocity of light, combined with Special Relativity, of the position of stars, as predicted by the formula (2) and (3).

**Soldier** (could be represented by analogies of Inst. soldiers from 1). *Vr. number*, no number; *Inst. soldiers*, \*soldiers, make could, justifiably of a soldier and the soldier, as all his employment is made possible of armed by force, gives the command force. There are many soldiers, each does an

for some special use. Three grades of solder are in common use: common solder, of equal parts of tin and lead; fine solder, of 2 parts of tin to 1 of lead; and a cheaper article, of 2 of lead to 1 of tin. The soft solders are usually of lead and tin, or lead, tin, and bismuth; these melt at a low temperature. The hard solders can not be melted at a low temperature; they are commonly of zinc and copper.

**Sold Note:** See **BOUGHT NOTE**.

**Sole** [viâ O. Fr. from Lat. *so'lea* (so named from its broad flat shape), liter., slipper, whence Eng. *sole* (of a shoe or of the foot)]: a flatfish of the family *Soleidae*. The common sole, *Solea solea*, has the scales ctenoid, the vertical fins not confluent, the pectorals of both sides developed; it is dark brown on its upper and white on its lower side, with the pectoral fin blackish at its end; it generally ranges between 10 and 20 inches in length, and between 1 and 10 lb. in weight, although the latter dimensions are rarely attained. It is found along almost the entire coast of Europe, and is one of the most esteemed of fishes; the flesh is white and firm, and is in season in all months of the year except the spawning-time, which takes place toward the end of winter. It is chiefly taken on the coasts of the British Islands by trawling. Several attempts have been made by the Fish Commission to introduce it into U. S. waters. Another species found on the British coast is the *Solea (Pegusa) aurantiaca*, or lemon-sole. *Achirus lineatus* of the Eastern U. S. is the nearest American ally of the European species, but this is more popularly known as the hog-choker, coverclip, or calico; it is a worthless fish. In California several species of true *Pleuronectidae*—e. g. *Parophrys vetula*, *Lepidopsetta umbrosa*, *Psettichthys melanostictus*, and *Orthopsetta sordida*—are called soles. Revised by F. A. LUCAS.

**Sole'idae** [Mod. Lat., named from *Solea*, the typical genus. See **SOLE**]: a family of flatfishes (*Heterosomata*). The body is oblong or elongated, and nearly equally developed above and below the lateral line; the scales are small, or absent; the lateral line mostly straight (sometimes double or triple); the head small, and with a rounded projecting snout, and more or less hooked upper jaw; the eyes are approximated, and the upper is further forward than the lower; the opercula concealed by the scales; the mouth unsymmetrical, and rather small and curved; teeth generally confined to the blind side of the jaws, and villiform (sometimes wanting); branchial apertures restricted above; the dorsal begins on the snout, the anal under the pectoral fin; pectorals small or (in some genera) absent; ventrals small and variously developed. The vertebrae are very numerous, but unequally distributed, in the typical forms the abdominal or rib-bearing ones being only eight or nine in number, and the caudal about forty. The family is well distinguished by the physiognomy from the *Pleuronectidae*, especially so far as the European and American species are concerned, but some Australian types lessen the distance between them. Species are most abundant in the tropics, but are found in every sea except the extreme polar ones.

Revised by F. A. LUCAS.

**Solemn League and Covenant:** See **COVENANT, NATIONAL**.

**Solenocoen'chæ** [Mod. Lat.; Gr. *σωλήν*, channel, pipe + *κόγχη*, shell]: the *Scaphopoda*, or tooth-shells, in allusion to the tubular nature of the shell. See **MOLLUSCA**.

**Solenogas'tres** [Mod. Lat.; Gr. *σωλήν*, channel + *γαστήρ*, belly]: an order of shell-less molluscs, embracing a few forms from the deep seas. They are of interest to zoölogists as being very simple and primitive forms. See **MOLLUSCA**.

**Solenog'lypha** [Mod. Lat.; Gr. *σωλήν*, channel, pipe + *γλῶφειν*, curve, cut]: a sub-order of snakes. The maxillary bones are excessively shortened, and thereby assume a vertical aspect, and are thus adapted to support the venom-fangs; the fangs (except in *Causus*) are competely tubular; the pupils of the eyes are generally erect and elliptical; the occipital region is scaly. The sub-order includes the most poisonous and dreaded snakes of America; some equally dangerous in the Old World belong to the sub-order *Proteroglypha*. By Cope four families are recognized—viz.: (1) *Crotalidae*, including the rattlesnakes and copperheads; (2) *Viperidae*, typified by the vipers of Europe and Africa; (3) *Causidae*; and (4) *Atractaspidae* of Africa.

**Solenne**, sô'lêr' (Germ. *Solothurn*): canton of Northwestern Switzerland; area, 302 sq. miles. The surface is cov-

ered by offshoots of the Jura Mountains, which here are very rich in iron and marble. The soil is fertile, and produces more corn and wine than is demanded for home consumption. The rearing of cattle, sheep, and swine is extensively carried on. Manufactures are confined to iron goods, glassware, and watches. Pop. (1888) 85,621, of whom 74 per cent. were Roman Catholics and the rest Protestants; they all speak the German language. The chief town is Soleur (Lat. *Solodurum*); pop. (1888) 8,460.

**Solfeggio:** See **SOLMIZATION**.

**Solferino**, sôl-fâ-ree'nô: village of Mantua, Northern Italy; celebrated for the battle in which the French, under the command-in-chief of Napoleon III., and the Sardinians, under Victor Emmanuel, utterly defeated the Austrians (June 24, 1859) (see map of Italy, ref. 3-C). It was the decisive battle of the war of Italian independence. The forces of the allies numbered about 150,000, while the Austrians brought about 170,000 into the field. After their defeat the latter retreated toward Verona and left all Lombardy open to the allies. Napoleon, not caring to attack the strong position that the Austrians held in the Quadrilateral, concluded the truce of Villafranca.

**Soll:** See **CILICIA**.

**Solicitor** [in form viâ O. Fr. from Lat. *solicita'tor*, deriv. of *solicita're*; in meaning deriv. of Eng. *solicit* (in its legal sense), from Lat. *solicita're*, urge, entice; *sollus*, whole + *ciere*, *ci'tum*, move]: in Great Britain (under the present statutes), an officer of the Supreme Court of Judicature who, and who only, is entitled to sue out any writ or process, or begin, or carry on, solicit, or defend any action or other proceeding in any court, his official title being solicitor of the Supreme Court.

Formerly the term solicitor was applied only to those who conducted such business in the court of chancery, the corresponding terms in the common-law courts being **ATTORNEY** (*q. v.*), and in the ecclesiastical and admiralty courts **PROCTOR** (*q. v.*); but it was the general practice to be admitted both as solicitor and attorney. The Scotch term corresponding to solicitor is *law-agent*, and the act regulating the admission to practice the privileges, etc., of law-agents is the Law-agents' Act, 1873 (36 and 37 Vict., c. 63). The solicitor is distinct in Great Britain from the counsel or barrister (called advocate in Scotland), not only as to the work performed by him for his client, but also as to the requirements for his admission to practice and his relations to his clients. These matters are minutely regulated by statute.

The Solicitors' Act of 1843 provides that with certain exceptions no person shall be admitted as solicitor or attorney unless he has served as an articulated clerk for five years to a practicing attorney or solicitor, or in case of a person having a university degree three years, or has been previously admitted to the bar, or has been ten years clerk to an attorney previous to being articulated. No solicitor is allowed to have articulated clerks except when practicing, nor more than two at any time; and the clerk may not engage in any other employment without the consent in writing of the solicitor and the sanction of a judge of the high court. Examinations must be passed at times and upon subjects fixed in accordance with statutes.

A solicitor, unlike a barrister, is liable to his client for negligence in the conduct of his case; and may sue his client for his remuneration, and has a general lien for his costs on his client's papers. The remuneration of solicitors in conveyancing and other noncontentious business is fixed by law with "reference to such matters as the amount of money to which the business relates, and the skill, labor, and responsibility involved on the solicitor's part." He, being an officer of the court, is subject to the summary jurisdiction of the court for professional misconduct, etc.

Solicitors can not practice as advocates in the upper courts, but may before magistrates at petty sessions and quarter sessions where there is no bar, in county courts, at arbitrations, at judges' chambers, coroners' inquests, revising barristers' courts, under-sheriffs' and secondaries' courts, and the court of bankruptcy. He must, under a considerable penalty, take out a yearly certificate authorizing him to practice. See Cordery's *Law Relating to Solicitors* (2d ed. London, 1888); Turner's *Duties of Solicitor to Client* (London, 1884); Begg on *Law Agents*. F. STURGES ALLEN.

**Sol'idus**: the later Latin name for the Roman gold coin called *aureus*. It received this name first in 296 when Diocletian reformed the currency, and it retained its full weight

and you will, completely and fully, attach to this period, no longer to the period of the present. It is now supposed by the thinking middle class, Marxists included, that the bourgeoisie had more opportunity to express itself in the period of the present than it has now. All around it, however, is a period of extreme repression, of extreme suppression and concentration of power, unrepresented. There is almost no more under the name of selfless, not of such, under the name of individual of pleasure in a repression and value. To this the bourgeoisie is attached in France, but the bourgeoisie is not represented by the equivalent class of the continent. The bourgeoisie is only to be struck in some parts of Italy and Germany, of which the bourgeoisie is not in order to meet the bourgeoisie of the bourgeoisie of the bourgeoisie. In the United States the bourgeoisie is a means of national, and the bourgeoisie is the bourgeoisie of the bourgeoisie by the word of the bourgeoisie of the bourgeoisie. If these success in the bourgeoisie of the bourgeoisie.

**Snail-Pigeon** (From Lat. *coluber* a Snaker, *flavifrons*): a group of snake-like reptiles, in which the head is distinct from the long-pointed *snout*, and the abdomen is elongate and slender segmented. The body is usually densely haired. The first part of a snake's body is its large pithers, the eye and ear are bul-like. These animals which live in the warm parts, and especially the desert portions of both Indian spheres. Sometimes by means of hibernation. They have the name of being very poisonous, especially in the Old World, and are more ponderously builded. There are about sixty species, distributed among seven different genera, of which *Coluber* and *Trachoides* are best known. J. S. KIRBY.

*Sollimōus*, sh-lō-mōus, or *Sollimous*, sh-lō-mōus; the American name for the middle Amazon, from the Peruvian meaning to the junction of the Rio Negro. It was originally the name of an Indian tribe. See *Amazon*.

See Hagenau, town of (German Pressing); 18 miles E. of Hagenau. Industries for the manufacture of iron and steel goods, especially screw-bolts, in the Michels, Agas, steel and an iron-rolling center for such manufactures, especially of outer rings of continuous pumps, ref. 441. In the district are about 4,700 small shops and establishments, which employ 74,000 workmen. In the town, too, are the large factories, where are 9,000 small forges and shops. Page 1496, 36-510.

Mill's own *History of the Commercial Revolution* is indebted to the first half of the third century, and stretches over the *Historia Monasteriorum Belgicarum*, in which he gives a brief sketch of the world as it was known to him, accompanied with historical notices and remarks on the main public, religious, civil and social conditions of the various countries. The greatest part is derived through intermediate sources from the *Natural History* of Pline and Strabo, etc. Mill and his co-independent value. In the Middle Ages the book was much read. There are editions in Saxony (1699) and by Meuschen (Berlin, 1864), and an English translation by Golding (1797).

Collo, 1444. Juan Ponce de Navarrete, by probability of birth, a Navarrese, Spain, abt. 1470. Of his early voyages nothing definite is known, but Navarrete considered it probable that his name on the Huemul coast with Diego Camero in 1540. In 1546 he was associated with Vicente Yañes Pinzon in an exploration of the coasts of Honduras and part of Yucatan; and in 1550, again, with Pinzon, he explored along the eastern side of South America to lat. 40° S., entering the Bay of Rio de Janeiro, and passing the Plata without exploring it. In 1552 he was appointed chief of a Spanish expedition to Navarrete. In this capacity he was ordered to make a southwestern passage to the East Indies, starting from Lima with three vessels in Oct., 1555. Entering the Plata, he explored it for some distance, but, finding no passage, was killed by the Chiriqui Indians; the ships were returned to Spain. The Plata was for some time called the Estero, though it is probable that Solis was not the first to name it.

**Salmoung** (Lat. *Salmoung* town), in the province of Aquila, dept. Abruzzo, Italy, on the point S. W. of Chieti (see map of Italy, vol. 5-6). The cathedral and the Church of the Annunziata are noteworthy. It is the birthplace of Uboldi, Pope, 1419.

**Solomon** [from Heb. שְׁלֹמֹה, *Shlōmō*, "peaceable"]; the son and successor of David, King of Israel. His name was given with reference to the peace which it was predicted, should attend his reign (1 Chron. vi. 33-35). An important element of Jehovah's special promise to the eternal line of David (2 Sam. vii. 12) was that Solomon, David's son, beloved of Jehovah (2 Sam. xii. 24, 25). His mother was Bathsheba, who had been the wife of Uriah, his death concerning a considerable time after David's repentance for that fatal affair, his conduct in the matter of Uriah. In 1 Chron. xxi. 1-5, xvi. 28 is an account of Solomon's being made king, followed (verses 22b-25) by an account of his being made king "a second time," this second account being clearly a continuation of the narrative in 1 Kings i. Apparently the first coronation occurred at or near the close of the fourth year of David this last year had once and just before the outbreak of Absalom's rebellion (1 Chron. xxi. 4; 2 Sam. x. 7). At all events this re-coronation gives a consistent meaning to the fitting date, while the different interpretations commonly received make them inconsistent and unintelligible.

Solomon began his reign humbly and wisely, asking God for wisdom, which was granted. In his fourth year he began his great work, "the house of the Lord," for which David had laid plans and accumulated enormous treasures. It was completed and dedicated seven years later. This was but the beginning of his achievements as a builder. Among the structures attributed to him are his own palace, "the House of the Forest of Lebanon," and his wonderful throne, together with tables, fortiifications, stations for commerce, reservoirs, and aqueducts. He also engaged in husbandry and in landscape gardening. He peacefully consolidated the kingdom, which his father had conquered. He reorganized and enlarged the civil service of Israel. He started the birth of pastoral or agricultural Hebrews on the east and west coasts, sending ships to Ophir, India, and Arabia to the East from the new-hatched port of Eilat, gathered on the eastern arm of the Red Sea, and from Jeddah and Tyre, westward to "Tarshish" in Spain. Many kings were his tributaries, ruled wealth and the wonders and richness of many countries flowed into or through the land. Many foreigners were attracted by his splendor and opulence, but while the Queen of Sheba, with her precious odors, the harpist grew to number 1,000 hangers, and thus to spend with Oriental ideas of his royal magnificence. He appears as a patron of imaginative beauty and power, turbulence

generous, sympathetic, and at first humble; of fine humor and noble intellect, a man of broad views, a far-sighted statesman, most learned in the science of the day. He was an organizer of splendid executive powers, a great builder and artist, poet, philosopher, and had from the Lord pre-eminently "an understanding heart to judge." Unfortunately, there is another side to the picture. From motives of state policy Solomon married the daughter of Pharaoh of Egypt and many other wives from among the princesses of his tributary kingdoms. This led to latitudinarianism in religion, to extravagance in public expenditures, to oppression and disregard of human rights. The result was that his reign was partly a failure. Before his death Edom and Syria revolted and Jeroboam raised rebellion in Northern Israel. After his death the ten tribes revolted, so that the strictly Israelite portion of his kingdom was divided, while the tributary peoples fell away from their allegiance.

**Solomon ben Gabirol'** (Arab. *Abu Ayyūb Sulaimān ibn Gabirol*; Lat. *Abi-gebrol, Avicēbrol, Avicēbron*): Jewish philosopher and poet; b. in Cordova, Spain; lived for a time at Saragossa; d. about 1041. His chief poem is the hymn *Kether Malkuth* (Crown of Royalty), a philosophical explanation of Jewish doctrine. His chief prose work, written in Arabic, is the *Source of Life*, in which "the theories of Plotinus are developed and the will plays a part almost as it does in the system of Schopenhauer." This work was freely used by Christian writers in the Middle Ages; the discovery of the identity of the author with Gabirol was made by Munk. Gabirol also wrote a work on ethics. See Steinschneider, *Hebr. Uebersetz. im Mittelalt.* (vol. i., § 219); Stössel, *Sol. ben Gabirol als Philosoph* (Leipzig, 1881); Dukes, *Solomon ben Gabirol* (Hanover, 1860); Guttmann, *Die Phil. des Ibn Gabirol* (Göttingen, 1889).

**Solomon ben Isaac**: See RASHI.

**Solomon (Germ. *Salomon*) Islands**: an extensive archipelago E. of New Guinea, from which it is separated by the Bismarck Archipelago and Louisiade islands. It extends in a line S. E. and N. W. from about lat. 4° S., lon. 154° E., to lat. 12° S., lon. 162° E., and consists of seven large islands and very many small ones. The islands forming the northern half of the archipelago were taken under German protection in 1886. The largest of these are Bougainville (pop. 10,000), Choiseul (5,850), and Isabel (5,840). The total area of the German Solomon islands is 8,708 sq. miles, with a pop. of 89,000. The remainder of the archipelago has an area of 8,357 sq. miles and a population of 87,000. It was brought within the British protectorate in June, 1893. The inhabitants are Papuan and Polynesian, the latter living especially on the smaller islands, where the population is often very dense. They are intelligent, quick, and crafty, but make good servants, and are in demand on the Bismarck Archipelago as laborers. They are cannibals; their weapons consist of the bow and arrow, spear, and club, which are all characterized by fine finish. Their canoes are the finest in the Pacific. The islands are essentially volcanic, but are surrounded by coral reefs. They were discovered in the sixteenth century, but were lost sight of until 1767, when they were rediscovered by Carteret. They are still the least-known group of the Pacific. See *Voyages* of Dalrymple, Hawkesworth, Fleurien, Labillardière, Dumont d'Urville, Brenchley, and Wood; Wallace, *Australasia*; and Woodford, *A Naturalist among the Headhunters* (1890).

**Solomon, Song of**: See CANTICLE.

**Solomon's-seal**: any one of the bilineous herbs of the genera *Polygonatum*, *Vagnera*, and *Unifolium*. They are found in Europe and North America. The roots are popularly esteemed as a vulnerary, and have some use in domestic medicine. The name properly belongs only to the species of *Polygonatum*; the "seal" is the circular depressed scar left on the root-stock by the death and separation annually of the flowering stem. The common Solomon's-seal, *Polygonatum multiflorum*, is found in woods and copses in many parts of England, and also in a few places in Scotland. It has a stem about 2 feet high, the upper part of which bears a number of large, ovate-elliptical, alternate leaves in two rows. The flower-stalks are generally unbranched; the flowers, which are not large, are white and drooping.

**Sol'on**: statesman, sage, and poet; the son of Execestides; filled the office of first archon in Athens (Ol. 46, 3; B. C. 594), and in that capacity established there the constitution framed by him. He is the noblest representative of the many-sidedness which distinguished the Athenian more than all other Hellenes. An Eupatrid by birth, he engaged also in trade and commerce by sea. By this means it was possible for him, after finishing all exercises, as well in music and poetry as in gymnastics, to become acquainted with the entire coast of the Archipelago. It was a time of fermentation in society; Psammetichus had opened the Nile region to the Greeks (B. C. 606); the first money had been coined in Ægina; navigation took all at once a gigantic stride forward; young adventurers gained in a few years great riches, and those parts of the communities engaged in trade took form as a new middle class, and stood defiantly opposed to the ancient families; property in land was outstripped by movable capital; around Athens on all sides—in Argos, Corinth, Sicyon, Megara—the old system of things had been broken, the ruling families had been overthrown, and through the downfall of the constitutions single tyrants had come to power, who shone by their riches, employed mercenary troops, and pursued a narrow policy of self-aggrandizement. In this revolutionary time, spite of all splendor, the best possessions of the nation were endangered—namely, the free citizen class and the sovereign authority of the law. For this reason Solon deemed it the work of his life to give his native city the benefit of all progress in culture which the times offered, without causing her to break with the past and be exposed to the deplorable evils connected with a revolution. A written criminal code, such as Dracon had issued (B. C. 621), was not able to supply the want; a thorough, peaceful reform of the state was needed, which should reconcile the differences which tore the communities asunder. For a moral and political renovation of the state was needed more than all else a vigorous self-consciousness. The Athenians, however, were feeling depressed; Megara held possession of Salamis, and was consequently mistress of the sea; the Athenians were like captives in their own land, and in deep despondency had renounced their own islands on the coast. Inflamed by Solon's inspiring poetry, they conquered Salamis (about 604). This was a turning-point for the history of Greece. From that day Megara sank, and Athens resisted power.

Solon was the first man in Athens; he was at liberty to secure for himself absolute power for life, but it was his firm resolve to accomplish his purpose without any violation of law. As recognized mediator between all parties, and solely by the force of his genius, his impressive words, and his pure personality, he carried out the most important reforms, applying them to the evils of society at the very root. The radical evil was that the small landowners were hopelessly in debt. Owing to a hard debtor-law, they forfeited even their freedom; a wretched proletariat was thus formed, and the land fell more and more into the hands of the great capitalists. Solon caused Athens to alter its standard of coinage (probably after the example of Corinth) by adopting also for silver the Euboean gold standard. The result was a lighter drachma, in which debts could be legally paid, so that the poor obtained a relief of 27 per cent. Other measures of alleviation were also introduced: the debtor-laws were made milder, and fixed limits set to the acquisition of large estates; and the surprisingly great success of this legislation (*Seisachtheia*) in lightening the burdens of the people is most plainly attested by the glorious poem of Solon, in which he calls Mother Earth to witness that she has been happily freed from the burden of many pawn-pillars (which were set up in the ground as tokens of alienated lands). Then followed the great political reform—the conversion of the state, ruled by families, into a timocracy. It seemed to the noble families only a new guaranty of their privileges that none could hold office as archons except the members of the first class, the Pentekosiomedimni (with a minimum of 500 bush. of barley net income, corresponding to a taxable capital of 6,000 drachmæ or one talent), while the citizens of the second class, the knights, with 300, and those of the third (*Zeugitai*), with 150 medimni as minimum of each year's income, had access to the council and to the remaining offices. The mass of the people, the Thetes, who did not belong to the three classes, could not become members of the council nor fill any office, but took part in the public assemblies. No one,

75,000 sq. miles. By an arrangement of the British and Italian governments in 1894 the limits of their protectorates were strictly defined. It is mountainous, rich in myrrh and incense, and inhabited by tribes related to the Abyssinians and Gallas, mostly nomads and ill famed on account of their savage and predatory habits. The principal port is Berbera, in lat. 10° 22' N. It has an excellent harbor. During the hot season it is deserted, but in winter comprises a population of about 30,000 people, who gather to exchange the products of their industry. See James, *The Unknown Horn of Africa* (2d ed. 1890). Revised by M. W. HARRINGTON.

**Somatology** [Gr. *σῶμα*, *sōma*, body + *λόγος*, *logos*, discourse, reason]: the science of living organized bodies as far as relates to material conformation and not to psychological phenomena. Thus it is included within biology. In a limited sense it is applied to the science of the human body, when it is equivalent to human anatomy and physiology. The name somatology has also been given to the study of inorganic bodies, in which case it does not differ much in signification from physics. See ANTHROPOLOGY.

**Sombrerete**: town of the state of Zacatecas, Mexico; 100 miles N. W. of Zacatecas (see map of Mexico, ref. 5-F); 8,432 feet above the sea. It is noted for its silver mines. The celebrated "black vein" of Sombrerete was formerly said to yield the richest ore in the world. The town had a mint in 1810-12. Pop. about 9,000. H. H. S.

**Somers, JOHN**, Lord: statesman; b. at Worcester, England, Mar. 4, 1651; educated at Trinity College, Oxford; studied law at the Middle Temple; called to the bar 1676, but remained at Oxford, engaged in classical, historical, and juridical studies; translated from classic authors and wrote pamphlets in vindication of the exclusion of the Duke of York from the succession and in defense of grand juries (1681); began legal practice at London 1682; soon became a leader of the Whigs; one of the counsel for the seven bishops 1688; sat as member for Worcester in the Convention Parliament Jan., 1689; was chairman of the committee which drew up the Declaration of Right; was made successively Solicitor-General, Attorney-General, Lord Keeper of the Great Seal, and in 1697 was appointed Lord Chancellor and raised to the peerage. His fidelity to William III. exposed him to frequent attacks, one of which resulted in his removal from the chancellorship Apr. 17, 1700, and another caused his arraignment for trial before the House of Lords with a view to impeachment on fourteen very miscellaneous charges Apr. 1, 1701, but the prosecution was withdrawn June 17, 1701. He recovered his influence at court; was chosen president of the Royal Society 1702; drew up the plan for the union of the crowns of England and Scotland 1706; became president of the council Nov., 1708, and resigned 1710. D. in London, Apr. 26, 1716. A valuable collection of state papers, known as the *Somers Tracts*, was edited from originals in his library (16 vols. 4to, 1748-52). A new edition of the *Tracts* was issued by Sir Walter Scott (London, 13 vols. 4to, 1809-15). His *Life* was written by R. Cooksey (1791). Revised by F. M. COLBY.

**Somerset**: city: capital of Pulaski co., Ky.; on the Cin., N. O. and Tex. Pac. Railway; 6 miles N. of the Cumberland river and 79 S. of Lexington (for location, see map of Kentucky, ref. 4-H). It is in a grain, fruit, and vegetable growing region, near extensive mines of coal and iron, and contains 12 churches, 2 high schools, a national bank with capital of \$100,000, a banking company with capital of \$80,000, and 2 weekly newspapers. Pop. (1880) 805; (1890) 2,625; (1895) estimated, 3,500. EDITOR OF "REPORTER."

**Somerset**: village; Perry co., O.; on the Balt. and Ohio Railroad; 20 miles S. W. of Zanesville, and 24 S. by E. of Newark (for location, see map of Ohio, ref. 6-G). It is in a region abounding in coal, iron ore, and potter's clay, and contains flour-mills, planing-mills, woolen-mills, carriage-factories, a State bank with capital of \$15,000, and a weekly newspaper. Pop. (1880) 1,207; (1890) 1,127.

**Somerset**: borough; capital of Somerset co., Pa.; on the Baltimore and Ohio Railroad; 36 miles N. W. of Cumberland, Md.; 110 miles E. S. E. of Pittsburg (for location, see map of Pennsylvania, ref. 6-C). It is principally engaged in the lumber-trade and in the manufacture of maple-sugar, butter, and cheese, and contains a public high school, 2 national banks with combined capital of \$100,000, and 4 weekly newspapers. Pop. (1880) 1,197; (1890) 1,713.

**Somerset, EDWARD SEYMOUR**, Duke of: b. about 1500; brother of Jane Seymour, third queen of Henry VIII. and

mother of Edward VI. After the death of Henry he rose to the head of affairs; was created Duke of Somerset and earl-marshal of England in Feb., 1547, and in March was made lord protector and governor of the realm, becoming king in all but name. When the Scots opposed the marriage of Mary Stuart to Edward VI., Somerset invaded their country and defeated them in the battle of Pinkie. This drove them to form an alliance with France, and war followed between that country and England, resulting in the latter's loss of Boulogne. His arrogance and rashness provoked opposition, and among his political adversaries was his own brother, Sir Thomas Seymour, who was apprehended and executed by his orders Mar., 1549. This brought the protector into great odium, and in Oct., 1549, he was deprived by the young king of his protectorship and thrown into the Tower, but was released with a full pardon in a few months. Among his foremost rivals was the Earl of Warwick, afterward Duke of Northumberland. Somerset entered into a plot against his life; was again arrested, found guilty of felony and constructive treason, and was beheaded on Tower Hill, Jan. 22, 1552.

**Somerset, FITZROY JAMES HENRY**: See RAGLAN.

**Somerset, ROBERT CARR**, Earl of: See OVERBURY, SIR THOMAS.

**Somersetshire**: county of Southwestern England; bounded on the N. and W. by the Bristol Channel; area, 1,630 sq. miles. The surface is much diversified by ranges of low, rocky hills; the Mendip Hills in the N. and the Quantock Hills in the W. Coal and freestone are mined, and iron and lead in small quantities. Large tracts of meadow and marshes afford excellent pasturage. The cheese known as Cheddar and cider are largely produced. Good wheat is raised around Bridgewater. Dairy-farming is one of the principal occupations; leather, glass, paper, and iron goods are manufactured. Pop. (1891) 484,337.

**Somers's Islands**: See BERMUDA ISLANDS.

**Somerville, WILLIAM**: poet; b. at Edston, Yorkshire, England, in 1677; entered Westminster School in 1690; became a fellow of Oriel College, Oxford, and in 1704 succeeded to his patrimonial estate, where he lived like a jovial country squire, dividing his time between his hounds, his books, and his bottle. His poems are *The Two Springs*, a *Fable* (1726); *Occasional Poems*, *Translations*, etc. (1727); *The Chase*, his best production, a didactic blank verse poem in four books on the art of hunting (1735); *Hobbinol*, or *The Rural Games*, a burlesque in blank verse (1740); and *Field Sports* (1742). D. July 19, 1742. Revised by H. A. BEERS.

**Somerville**: city; Middlesex co., Mass.; on the Mystic river, and the Boston and Maine and the Fitchburg railways; joining Boston on the N. W. (for location, see map of Massachusetts, ref. 2-H). It was formerly a part of the town of Charlestown, from which it was set off in 1842, and is a residential city whose inhabitants are largely engaged in business in Boston. It is connected with Boston by seven lines of electric and five of steam railway, contains 31 churches, 24 public-school buildings, valued at \$790,000, a public library, hospital, old women's home, insane asylum, 3 public parks, a national bank with capital of \$100,000, a savings-bank, and 2 weekly newspapers. The U. S. census returns of 1890 showed 387 manufacturing establishments (representing 58 industries), with a combined capital of \$3,788,018, employing 3,126 persons, paying \$1,716,496 for wages and \$4,369,064 for materials, and turning out products valued at \$7,824,082. The city was settled in 1629 and incorporated as a city in 1872. It is built on seven hills. The first vessel built in the State was launched from Gov. Winthrop's Ten Hill farm on the Mystic river in 1631; a powder-house erected on Quarry Hill about 1703 is carefully preserved and is now in the center of a public park; the strongest fortifications in the vicinity were built on Winter Hill during the siege of Boston; Gen. Putnam's "impregnable fortress" was on Cobble Hill; and the "citadel," where Washington raised the first colonial union flag, Jan. 1, 1776, was on Prospect Hill. Pop. (1880) 24,933; (1890) 40,152; (1895) estimated, 52,000. JOHN S. HAYES.

**Somerville**: borough; capital of Somerset co., N. J.; on the Raritan river, and the Central Railroad of N. J.; 11 miles W. N. W. of New Brunswick, and 36 miles W. S. W. of New York (for location, see map of New Jersey, ref. 3-C). It has gas and electric-light plants, sewers, water-works, 7 churches, graded public school with 16 teachers, a Baptist classical school, 3 primary schools, public library

termed the syrinx, just above the forks of the bronchi. To the syrinx are attached the singing muscles, numbering in the oscines from four to six or even eight pairs. The apparatus is simple, and its modifications are comparatively slight. There is no reason to suppose that the tongue takes any, at least any important, part in the production of sounds even in birds which pronounce words. Song is almost exclusively an attribute of male birds, although the female may sing, as does the cardinal of the U. S., and it is heard most often during the time of pairing, so that springtime is pre-eminently the season of song; still some birds sing pretty much throughout the year, and even, like the Carolina wren, in winter. The bobolink, on the other hand, changes his manners with his coat, and sings only in full-dress plumage. Early morning is the favorite hour for song, next to that the sunset-hour, but some birds, like the scarlet tanager, sing during the torrid heat of a southern noonday, and many songsters besides the nightingale sing at night, notably the mocking-bird and yellow-breasted chat of the U. S. The gay-plumaged birds of the tropics belong largely to the harsh-voiced *Clamatores*, but a bright coat is not a sure sign of a discordant voice, for the majority of that strictly American family the tanagers inhabit the tropics, and sing as well as the familiar scarlet tanager of more northern climes. Not only do individuals of a given species vary considerably in their power of song, but certain localities seem to develop musical talent better than others. The meadow-lark sings better in Florida than in the northern parts of the U. S., while the western subspecies excels that of the east.

F. A. LUCAS.

**Song of Solomon:** See CANTICLE.

**Songs** [O. Eng. *song*, *sang*; Germ. *sang*; Goth. *saggus*; cf. Gr. *ōphē*, tuneful voice, oracle < Indo-Eur. *songh-*]: from the literary standpoint, short lyric or dramatic poems suitable for setting to vocal music; from the musical standpoint, compositions of relative simplicity of form which carefully illustrate and enhance the sentiment expressed by the words. In the modern sense this form may be flexible as to development. The word *song* represents an indefinite quantity, in that its characteristics may range through a large scope as to musical value. There are short songs which may be compared to gems, in miniature, by the great painters. There are also the folk-songs of various countries (the *canti popolari* of the Italians), full of national characteristics, and immortal in their simplicity. Lastly, there are myriads of songs whose existence, both as to music and text, is fortunately but for a day.

DUDLEY BUCK.

**Songtao:** See SONGKOL.

**Sonnet** [either directly or via Fr. *sonnet* from Ital. *sonetto*, which in its turn probably came from the Prov. and O. Fr. *sonet*, a diminutive derived from the Lat. *sonus*, a sound or air in music]: a poetical form which, as finally perfected by the Italian poets of the thirteenth and fourteenth centuries, consists of fourteen hendecasyllabic verses (corresponding to English decasyllables), arranged according to a rigid scheme. The main features of this are the division of the whole poem into two parts, the first of eight verses (called the octave), the second of six (called the sestet); the further division of the octave into two tetrastichs (called in Italian *piedi*); the employment of but two rhymes in the octave, arranged *abba abba*; the use of either two or three rhymes in the sestet, arranged as may suit the poet. The sestet, when it forms an indivisible whole, is often called in Italian *simula*; when it falls into two tercets, *volte*. This severe form, however, has not been followed by all sonnet-writers, even from the earliest period. Shakspeare, for example, hardly observes the minor divisions of the sonnet at all. He arranges the rhymes of the octave *abababab*, or even *ababceded*, thus neglecting all the subtle modulations of the Petrarchan type. He often allows the sense to run over from the octave to the sestet; and even when he parts the two he makes little effort to contrast the meaning and the harmony of the latter with those of the former. This loose type of the sonnet is often called the bastard or illegitimate sonnet; but this is hardly justified by the history of the form.

There has been much discussion of the origin and development of the sonnet. The word occurs in both the Provençal and the Old French languages earlier than in Italian. Investigation has shown, however, that here *sonet* means simply a short *son*—i. e. musical air or lyric set to music. There are a few real sonnets in Provençal, but all of them are by Italians, or considerably later than the rise of the Italian sonnet. Everything points, therefore, to Italy as the

birthplace of the form; but there are difficulties as to the manner of its birth. A very widely accepted theory has been that it was originally simply one stanza of the lyric canzone. It is hard to see, however, the motive that should have led to such use of a single part of what was a very elaborately constructed and balanced poetical form. More probable is the theory first set forth by A. d'Ancona, in his *Poesia popolare italiana* (Leghorn, 1878), that the basis of the sonnet is purely popular. In fact, there exist even today popular lyrics, called *strambotti* and *rispetti*, whose existence is fairly assured for the earliest period of Italian poetry. The *strambotto*, whose home seems to have been Sicily, is an eight-lined stanza with rhymes arranged *abababab*. The *rispetto*, on the other hand, which was Tuscan in origin, is a precisely similar stanza, but of six lines, with rhymes *cdcdcd*. D'Ancona believed that the sonnet was obtained by one of the early courtly poets of the so-called Sicilian school, through joining these two forms. This theory has been slightly modified by Cesareo (*La Poesia Siciliana sotto gli Sverri*, Catania, 1894), who thinks that a six-lined *strambotto* existed in Sicily, as well as that of eight lines, and that the combination was effected in Sicily alone. Indeed, Cesareo believes that the inventor of the new form was Giacomo da Lentino, the most original of the Sicilian poets, who flourished in the first half of the thirteenth century. These investigations also show that the earliest sonnet scheme was nearer Shakspeare's than Petrarch's, as the rhymes ran *ababababcedcdcd*.

Though thus in all probability of popular origin, the sonnet form was from the start employed only by courtly poets. The subject-matter of the earliest sonnets is, like that of the rest of the poems of the first Italian cultivated poets, mainly derived from the poetry of Provence. During the thirteenth century it became more and more popular throughout Italy. Many experiments at refining and elaborating it were made. Gradually the rhyme system, *abba abba*, drove out the older system in the octave. Under the influence of Provençal poetical theories, the inner divisions were made sharper and clearer. On another side efforts were made to vary the fixed scheme, either by appending a couplet or group of couplets (*cauda* or *coda*) at the end or by inserting at fixed points subsidiary seven-syllabled lines, which rhymed with the preceding eleven-syllabled lines. According to the number of these insertions, such sonnets were called *sonetti doppi* and *sonetti rinterzati*. In some cases sonnets of twenty-eight verses were thus produced. The simpler form, however, proved the permanently satisfactory one; and this was finally fixed by the great master of all the Italian sonnet-writers—Petrarch.

The diffusion of the sonnet form outside of Italy began when the rest of Europe came to feel the powerful influence of the Italian Renaissance. In the Spanish Peninsula this took place in the fifteenth and early sixteenth centuries; and the earliest Catalan and Spanish sonnets belong to this period. In France, according to Joachim du Bellay, the sonnet was introduced from Italy by Mellin de Saint-Gelas, a poet of the early sixteenth century; but du Bellay himself and his friends of the Pléiade were the first to give it real vogue. In England it was introduced toward the middle of the sixteenth century by Wyatt and Surrey. The earliest German sonnet is to be found in a translation of an antipapal tract by Bernardino Ochino. This translation, made by one Christoph Wirsung, appeared in 1556.

The best general account of the history of the sonnet is to be found in H. Welter, *Geschichte des Sonnettes in der deutschen Dichtung* (Leipzig, 1884). The development of the sonnet in Italy is excellently treated by L. Biadene, *Morfologia del Sonetto nei secoli XIII. e XIV.* (fascicolo 10 of *Studi di Filologia Romanza*, Rome, 1888). Of value, but to be used with care, is Louis de Veyrières's *Monographie du sonnet, sonnetistes anciens et modernes* (2 vols., Paris, 1869-70). Less good is C. Tomlinson's work, entitled *The Sonnet: its Origin, Structure, and Place in Poetry* (London, 1874).

A. R. MARSH.

**Sono'ra** the northwesternmost state of Mexico; bounded by the U. S. (Arizona) on the N., Chihuahua on the E., Sinaloa on the S. E., the Gulf of California on the S. W., and the territory of Lower California on the N. W. Area, 77,334 sq. miles. The Sierra Madre Range forms the eastern boundary, and its spurs and sub-ranges cover much of the eastern part of the state, which is very imperfectly known. Succeeding this region are plateaus and valleys with a rich soil, but only available for agriculture by irrigation. The

lands along the coast are arid, except in the river valleys. The northwestern part is a desert, resembling the adjacent parts of Arizona. Of the few rivers the Yaqui is the most important. The climate is hot on the lowlands, mild on the plateaus and in the higher valleys; rains (principally from July to September) are scanty, and the northwestern deserts and parts of the coast-belt are essentially rainless. There is no true forest, except in the mountains. The state is rich in minerals; the mines of silver and gold have long been famous, lead occurs in conjunction with silver, and lately important coal-beds have been opened in the Yaqui valley, the product being exported to Arizona. Mining is the only important industry; cereals, etc., are cultivated in the river valleys, and there are considerable herds of cattle in the north. A kind of guano is found on islands in the Gulf of California. The Sonora Railway (from the port of Guaymas, on the gulf, to Benson, on the Southern Pacific Railroad) was originally built as an outlet for the coal-fields. Pop. (1893) estimated, 140,500. A large proportion are Indians of the Opatá, Pima, and other tribes, who retain their old customs and languages, and in many cases are practically independent. H. H. SMITH.

**Sonora:** city; capital of Tuolumne co., Cal.; on Wood's creek; 60 miles E. of Stockton, 90 miles S. E. of Sacramento; equidistant from the Yosemite valley and the Calaveras big-tree region (for location, see map of California, ref. 7-E). It is the center of a large gold-mining area; is principally engaged in mining, agriculture, lumbering, and grape-growing; and contains water-works, the Snell Library, an academy, foundry, quartz-mills, and three weekly newspapers. Pop. (1880) 1,492; (1890) 1,441.

**Sonson:** town of the department of Antioquia, Colombia; on the river Sonson; 33 miles S. S. E. of Medellín; 8,350 feet above the sea (see map of South America, ref. 2-B). It is the center of a rich grazing district, and is noted for its mild and salubrious climate and beautiful scenery. The river here forms a triple fall of 200 feet, and causes in its deep ravine a continual *son-son*, or echo, whence the name. Pop. about 12,000. H. H. S.

**Sonsonate:** town of Salvador; beautifully situated on a plain by the Sonsonate river, and on the railway from Santa Ana to the port of Acajutla; 40 miles W. of San Salvador (see map of Central America, ref. 4-E). It was founded soon after the conquest, and is the center of a rich agricultural district and the capital of a department of the same name. Pop. about 9,000. H. H. S.

**Sontag,** zōntaa'h, HENRIETTE: opera-singer; b. at Coblenz, Germany, Jan. 3, 1806; was gifted with fine vocal and dramatic powers, which were highly cultivated; excelled in German and Italian music, and at the age of twenty-five rivaled Malibran, Pasta, and Catalani; married Count Rossi, an Italian noble, in 1830, and retired to private life. She resumed her professional career in 1849, made a tour in the U. S. in 1853, and in Mexico. D. of cholera in Vera Cruz, June 18, 1854. Revised by B. B. VALLENTINE.

**Soo-Chow-Foo:** See **ST-CHOW**.

**Soodan:** another spelling of **SUDAN** (q. v.).

**Soofoes:** See **SUFIS**.

**Soo'soo, or Susu:** the *Platanista gangetica*, a cetacean of the *Ganges*, the only living representative of the family *Platanistidae*, which is allied to the *Iniidae*, or fresh-water dolphins of South America. It is some 6 or 8 feet long, and is ordinarily very sluggish, but can move after its prey, which consists of fish and crustaceans, with much vigor. It has long beaked jaws, 120 teeth, and curious rudimentary eyes. Revised by F. A. LUCAS.

**Soot** [O. Eng. *sōt*: Icel. *sōt*; cf. Ir. *suth*: Lith. *sūdis*; Fr. *sotie*]: a carbonaceous deposit from smoke, formed in chimneys. That which forms nearest the fire is often shining and varnish-like, consisting chiefly of dried tarry matters mixed with carbon, and giving a brownish-black powder, sometimes used as a pigment under the name of *noître*. That which forms further up the chimney is more of the character of **LAMPBLACK** (q. v.).

**Sooty Tern:** See **EGG-BIRD**.

**Sooty-smith,** soismith, WILLIAM: civil engineer; b. at Tarenton, O., July 22, 1830; graduated at the Ohio University in 1849, and at the U. S. Military Academy July 1, 1853. In 1854 he resigned from the army to engage in civil engineering; in 1855 became principal of the Buffalo High School. Resuming his profession in 1856 he was in 1859 placed in

charge of the construction of a bridge over the Savannah river, the foundations of which consisted of pneumatic piles. In the civil war he served as colonel of the Thirtieth Ohio Volunteers in West Virginia till Jan., 1862, when transferred to the Army of the Ohio, and was engaged at the battle of Shiloh, Apr. 7. Commissioned brigadier-general of volunteers Apr. 15, he participated in the siege of Corinth; commanded a division at the battle of Perryville; was chief of the cavalry department of the Tennessee July-Oct., 1863, and of the division of the Mississippi Oct., 1863-July, 1864, when compelled by ill health to resign. He has since been engaged in sinking foundations for bridges and other structures. He was a member of the U. S. board of 1875-76 for testing iron and steel. Revised by M. MERRIMAN.

**Sophi'a** (anc. *Serdica*; Bulg. *Sreletz*): city; capital of Bulgaria; on a small tributary of the Iskra, and on the main railway between Vienna and Constantinople (see map of Turkey, ref. 3-C). Till 1878 it was "a dirty and pestilential village of wooden huts," but since Russia wrested from the Ottomans a semi-independence for Bulgaria (1878), it has marvelously improved. It now resembles a European city with its straight, clean streets and attractive houses. Over 7,000 Ottomans from among its former residents have emigrated, but the population has almost trebled in seventeen years. Sophia possesses a commodious palace, the residence of the prince, a cathedral, an excellent college and schools, and a public garden. It manufactures leather, earthenware, and woolen cloth, and carries on an active transit trade. Pop. (1893) 47,000. E. A. GROSVENOR.

**Sophists** [from Lat. *sophistes* = Gr. *σοφιστής*, deriv. of *σοφίζεσθαι*, be or become wise, play the wise man or Sophist]: name applied to the seven wise men of Greece; afterward to the teachers at Athens who gave lessons in the arts and sciences for money. The course of Greek philosophy begins with the establishment of a material first principle—water, air, fire, etc.—and tends toward the recognition of mind as this first principle. Anaxagoras explicitly announced mind (*νοῦς*) as such first principle. The first and most obvious phase of mind as an activity is its capacity to reflect, and hence to discover grounds and reasons. Each ground or reason in some measure communicates its peculiar character to the fact or opinion which it grounds. Hence from the standpoint of grounds and arguments all truth seems to be an arbitrary affair, depending upon the selection which one makes of grounds and reasons. Truth is supposed to be many-sided, and the point of view taken is supposed to justify one's difference in opinion. The art of presenting grounds or reasons to justify any view is the art of the Sophists. The fact that these many sides or grounds of truth are mutually interdependent, and therefore that each has truth only as seen in view of the rest—this is the further and deeper insight which it belonged to Socrates and Plato to discover and unfold. The universal or general is the net result, as well as the active principle, of that dialectic process which appears in the genesis and mutual destruction of different opinions—"different points of view." As a necessary elementary stage of human thinking, the work of the Sophists is of permanent importance in the history of philosophy. The Eleatics, who set up the doctrine of pure being, found it necessary to deny being to the phases of change, finitude, and negativity that appear in the world. Zeno accordingly discovered the dialectic of self-contradiction involved in those phases. This was adopted by the Sophists, of whom the chief were Protagoras the Individualist (b. 490 B. C.), Gorgias the Nihilist (came to Athens 427 B. C.), Hippias the Polymathist, and Prodicus the Moralist (the two latter being younger contemporaries of Protagoras). Everything that existed in the Greek consciousness as opinion, faith, custom, religious tradition, even the evidence of the senses, was sapped and rendered uncertain by the rationalization of these Sophists. Protagoras asserted: Man is the measure of all things. Just as each thing appears to each man, so is it for him. All truth is relative. The existence of the gods is uncertain. Gorgias expressed his nihilism in three propositions: (a) Nothing exists; (b) if anything existed, it would be unknowable; (c) if anything existed, and were knowable, the knowledge of it could nevertheless not be communicated to others. "Common sense," so called, is the stage of naïve faith in one's point of view. The discovery of the equal validity of "many points of view" leads on the one hand to sophistical practices, or on the other to skepticism. Pyrrhonic skepticism in Greece connects back through the Megarian school to the dialectic

of the Sophists and of Zeno the Eleatic. See articles **SOCRATES**, **PHILOSOPHY** (*History of Philosophy*), and **MORAL PHILOSOPHY**. **WILLIAM T. HARRIS.**

**Sophocles**, sof'ō-klēz (Gr. Σοφοκλῆς): the second in time of the three great tragic poets of Greece; b. of a wealthy family at Colonus, a beautiful deme of Attica near Athens, in 496 B. C. He was carefully trained in all the arts of a liberal education, in gymnastics and music. At the age of sixteen he led the chorus of boys who danced and sang the pæan in honor of the victory of Salamis, and there is other evidence of his personal beauty and grace. His first play, acted in 468, was a great success, and won the prize over Æschylus after a close contest which was finally referred for decision to Cimon and his fellow generals. For the next ten years Sophocles divided with Æschylus the empire of the stage, the older rival learning from the younger as the younger had already learned much from the older. After the death of Æschylus, Sophocles was the leading dramatist. He never failed of at least the second prize, and coped successfully with such plays as the *Alcestis* and the *Medea* of Euripides. But as Æschylus accepted the improvements of Sophocles, so Sophocles in his later plays was clearly influenced by Euripides, whose greatness he did not fail to recognize. Sophocles took an active part in public life, and was called to hold high positions. In consequence of the sentiments expressed in his *Antigone* (440) he was made a colleague of Pericles in the command of the forces sent against Samos. Before that he had been an Hellenotamias or treasurer of the Alliance, and in the troublous times of the Peloponnesian war he is said to have been one of the *probuli* (πρόβουλοι) or committee of safety appointed in 411. Love played a large part in his life, and his sweet and easy temper was often put to the test. According to a familiar tradition, when far advanced in years Sophocles was brought before a family court by his son Iophon on the charge of disordered intellect. The aged poet recited the famous encomium on Colonus from the *Œdipus Coloneus*, which he had just composed, and the charge was dismissed—as the story may be. He died an easy death in 405.

Of his 123 dramas seven are extant, *Ajax*, *Electra*, *Œdipus Tyrannus*, *Antigone*, *Trachiniae*, *Philoctetes*, *Œdipus Coloneus*, the first three being the most popular in Byzantine times. Sophocles introduced the third actor and thus increased the life and movement of the drama, and life and movement were also enhanced by the change which made each drama of the trilogy (see **ÆSCHYLUS**) an independent play. These and other changes in the external form are manifestations of the same spirit that we find working in the heart of the Sophoclean drama. When we study Sophocles we are no longer in the Æschylean realm of Titanic beings, too vast for human sympathy, for while the heroes and heroines whom Sophocles brings before us are lifted above our level, they are of like passions with ourselves, and the motives are motives of flesh and blood, of human character and human will. His *dramatis personæ* are eternal types "writ large." In the construction of the plot Sophocles had no rival. His *Œdipus Tyrannus*, to cite but one instance, is a tragic web of unequalled subtlety and effectiveness. The lyric parts of his plays are in beautiful balance with the dramatic element. His language is more supple than that of Æschylus, but never falls short of elevation. It is sweet and yet does not lack a certain tang of austerity that saves it from cloying.

**EDITIONS.**—Among the most memorable editions of all the plays are those of G. Hermann (1830–41), Wunder-Wecklein (4th ed. begun in 1875), Schneidewin-Nauck (begun by Schneidewin in 1849 and repeatedly issued since), Campbell, in 2 vols. (1873, 1881, and repeated), Campbell-Abbott, 2 vols. (1886); above all, the monumental edition of Jebb (begun in 1883, nearly complete in 1895, with repeated issues of *Œdipus Tyrannus* and *Antigone*). Select plays by Wolf-Bellermann (begun 1858, often repeated). Text ed. by Dindorf (Teubner collection), by Schubert (Schenkli collection), by Nauck (Weidmann). Of noteworthy editions of single plays may be mentioned *Ajax*, by Lobeck (3d ed. 1866); *Antigone*, by Boeckh (1843), by Humphreys (1891); *Electra*, by Jahn (3d ed. 1882); *Œdipus Tyrannus*, by Elmsley (1821); *Œdipus Coloneus*, by Reisig (1820); *Philoctetes*, by Blaydes (1870), who has edited other plays of Sophocles also. Of translations into English verse may be noted Plumptre (1866) and Campbell (1874); of translations into English prose after Jebb's text, E. P. Coleridge (1893), and Jebb himself in the edition cited. For the enormous bibliography (down to 1874 only), see Genthe's *Index Commentationum Sophocle-*

*arum*. Invaluable is Ellendt's *Lexicon Sophocleum* (2d ed. by Genthe, 1872). See also Schöll's *Sophokles* (2d ed. 1870) and Patin's *Sophocle* (5th ed. 1877). **B. L. GILDERSLEEVE.**

**Sophocles**, EVANGELINUS APOSTOLIDES: Greek scholar; b. at Tsangaranda, Thessaly, Greece, Mar. 8, 1807; studied at the convent on Mt. Sinai; emigrated to the U. S.; entered Amherst College in 1829; was tutor in Harvard College, with a brief intermission, from 1842–49; assistant professor 1849–60, and in 1860 became Professor of Ancient, Modern, and Byzantine Greek. He published a *Greek Grammar* (1838; 3d ed. 1847); *First Lessons in Greek* (1839); *Greek Exercises* (1841); *Greek Lessons for Beginners* (1843); *Catalogue of Greek Verbs* (1844); *History of the Greek Alphabet*, etc. (1848); *Glossary of Later and Byzantine Greek* (1860), revised as *Greek Lexicon of the Roman and Byzantine Periods* (1870), etc. D. at Cambridge, Mass., Dec. 17, 1883.

**Sophonis'ba**: See **MASINISSA**.

**Sophon**: inventor or rather perfecter of the so-called **MIME** (q. v.); flourished at Syracuse in the middle of the fifth century B. C. The office of the mime was to represent in dramatic form a special situation or a special personage. It was a *commedietta* that lacked a chorus, that lacked an elaborate plot. The mimes of Sophron enjoyed a great reputation in ancient times; Plato read them again and again and slept with them under his pillow, and in Rome they were learned by heart and much imitated. A few fragments have been collected by Blomfield in *Museum Criticum* (vol. ii., 1826), and by Ahrens, *De Græc. Dialect.* (vol. ii., p. 464). Revised by B. L. GILDERSLEEVE.

**Soprano**: the highest type of the voice of women and boys. The compass of the high soprano may be said to extend from lower E on the treble staff to C above, and that of the mezzo-soprano from A below to A above. Among the high sopranos exceptional compass is sometimes found, reaching even to F and G in alt. **D. B.**

**Sor'a**: town; in the province of Caserta, Italy; on the Garigliano; about 58 miles N. N. W. of Naples (see map of Italy, ref. 6–E). The manufactures of paper, woolen, and other stuffs here are on a considerable scale, and are provided with modern machinery. Pop. about 5,400.

**Sorac'te**: the present *Monte di San Oreste*, a mountain of Etruria, an outlying offset of the Apennines, from which it is detached by the valley of the Tiber. It rises with its bold and abrupt masses of the peculiar hard Apennine limestone 2,420 feet above the surrounding plain, and forms, especially when its top is covered with snow, a conspicuous and very picturesque feature in the views of the Campagna. (Horace, *Carm.*, i., 9.) In ancient times it was dedicated to Apollo, and bore on its top a celebrated temple of this god, to which large and peculiarly solemn processions were made from Rome, situated 26 miles to the S. In 746 Carloman, the brother of Pepin, founded the monastery of San Silvestro on the site of the old pagan temple. Its present name the mountain has received from a village, San Oreste, situated on its slope and well known for its sour wine.

Revised by J. R. S. STERRETT.

**Sorata**: See **ILLAMPU**.

**Sorbian Language**: another name for Lusatian-Servian; see **SLAVIC LANGUAGES**.

**Sorb'ite**, or **Mountain-ash Sugar** [*sorbite* is from Lat. *sorbum*, sorb-tree]: a saccharine substance formed in the juice of the berries of *Sorbus aucuparia*, the mountain-ash of Europe, as well as in the related American, *Sorbus americana*. The compound has the composition  $C_6H_{12}O_6$ , being isomeric with mannite. It belongs to the alcohols, and is in turn related to the sugars. **I. R.**

**Sorbonne**, sôr'bün': the name generally applied to the theological faculty of the ancient University of Paris. It was derived from Robert de Sorbon (b. at Sorbon, in the Ardennes, in 1201, and afterward chaplain to Louis IX.; d. in Paris, renowned for sanctity and eloquence, 1274). In 1252 he founded an institution connected with the University of Paris, in which seven secular priests were to teach theology gratuitously to sixteen poor students, and in the following year the institution received its charter from Louis IX., which was confirmed in 1268 by Pope Clement IV. Connected with it was a preparatory school. Both were under a provisor. The severity of the examinations made its degrees of high esteem. The great care which was taken not to admit among the teachers any but men of the highest

its crystallization. These bodies can be largely separated from the sugars by treating the partially evaporated juices with alcohol. Experiments made by the department of agriculture in 1891 indicated that fully 200 lb. of sugar per ton could be made from sorghum in this way. The character of the U. S. internal revenue laws, however, prevents the use of alcohol except under such restrictions as would render it unprofitable.

Extensive experiments were conducted by the department of agriculture from 1888 to 1893 at Sterling and Medicine Lodge, Kan., in the improvement of sorghum as a sugar-producing plant. New varieties were developed and the content of sugar therein greatly increased. Seeds selected from canes with a high content of sugar were carefully propagated and continued from year to year in a direct line of descent. The most approved varieties of sorghum as thus developed are Amber, Folger, Colman, Collier, McLean, Link, No. 8X, No. 112, No. 161, and Orange.

*Sorghum as a Food.*—Sorghum produces seeds which are quite equal to ordinary cereals for food. The composition of sorghum seed is shown in the following table:

| PARTS.   | Seeds with<br>glumes,<br>per cent. | Seeds without<br>glumes,<br>per cent. |
|--|------------------------------------|---------------------------------------|
| Moisture .....                                 | 9.93                               | 9.63                                  |
| Albuminoids .....                              | 10.54                              | 11.39                                 |
| Petroleum spirit extract (oil) .....           | 3.72                               | 3.16                                  |
| Ether extract .....                            | 0.61                               | 0.54                                  |
| Eighty-per-cent. alcohol extract (sugar) ..... | 2.91                               | 1.78                                  |
| Fiber .....                                    | 3.17                               | 1.83                                  |
| Ash .....                                      | 2.05                               | 1.69                                  |
| Starch and soluble carbohydrates .....         | 67.07                              | 69.98                                 |

Each ton of sorghum will yield from 100 to 150 lb. of seed. Sorghum is also valuable as forage when sown broadcast and harvested as hay or preserved in silos. It is chiefly cultivated for this purpose in Southern and Southwestern Kansas and in many other of the semi-arid regions of the U. S., as it yields a crop which can be relied upon in all seasons. In all parts of the U. S. sorghum is cultivated in a small way for molasses-making. The method of cultivation is almost identical with that of maize, but the young plants require more care. The ripe canes are relieved of their seed-heads and blades and crushed in small three-roll mills usually driven by animal power. The expressed juices are treated with cream of lime heated to the boiling-point and the scums removed. The clear juice obtained is rapidly concentrated in kettles or shallow pans to the consistency of molasses, yielding when carefully controlled a wholesome and pleasant product.

*Statistical.*—The number of gallons of molasses made in the U. S. from sorghum in the census year 1860 was 6,749,123; in 1870, 16,050,089; in 1880, 28,444,202; in 1890, 24,235,219. In the last-named year 415,691 acres were cultivated in sorghum. The yield of sugar reported to the internal revenue for the purpose of receiving bounty for the fiscal year ending June 30, 1892, was 1,136,186 lb., for that ending in 1893 1,026,100 lb., and for that ending in 1894 882,572 lb. The average yield of cane per acre was 5.3 tons, and the average yield per ton of cane manufactured 82.5 lb. Much sugar is also made as an incidental product in the manufacture of molasses.

HARVEY W. WILEY.

*Soricidae* [Mod. Lat., named from *Sorex*, the typical genus, from Lat. *so'xer*, shrew]: a family of mammals of the order *Insectivora*, including shrews or shrew-mice. Externally they resemble mice, but are readily distinguishable by the longer and pointed snout. In contrast with the *Talpidae*, to which they are most nearly related, they present the following characters: The skull is long, narrow, and pointed; the zygomatic arch is lacking, and there are no post-orbital processes; the tympanic is ring-like; the tibia and fibula are ankylized; the halves of the pelvis do not meet; there is no cæcum; the teeth range in number from 26 to 36 (M.  $\frac{3}{1}$ , P. M.  $\frac{1}{1}$ , C.  $\frac{1}{1}$ , I.  $\frac{1}{1}$   $\times$  2); the cusps of the upper molars are arranged in a W; the upper incisors are large and hook-shaped, the first lower incisors are usually directed forward; the cervical vertebrae have well-developed hypapophyses, and the dorsal and lumbar distinct hyperapophyses; the sternum has a broad but not keeled manubrium. The family is a very homogeneous one, and representatives are found in the entire northern hemisphere, and extend southward into India and Eastern Asia in the Old World and into Mexico in the New. The species are all small, and some of them are among the least of mammals. They have certain

glands near the fore limbs, on the sides, and behind at the base of the tail, in which is secreted a musky fluid. They feed not only on insects, worms, etc., but on such young vertebrates (birds, etc.) as they are able to overcome.

Revised by F. A. LUCAS.

*Soris*: the name given by Manetho to *Snofru* (*S-nefer-u*, *Snefru*), the first king of the fourth Egyptian dynasty. Little is known about the man himself except that he waged war in Sinai and opened the copper mines in Wâdi Ma'ârah, where the evidences of his labor are still visible. His tomb was the False Pyramid at Mèdûm, built of Mokattam limestone, well jointed, 115 feet high, but never completed. After death he was the recipient of divine honors, and evidences have survived which indicate that his cult continued throughout the remainder of Egyptian history. Monumental remains begin to be numerous from the time of Soris and his successors during the fourth dynasty, and the representations of scenes of private life preserved on the walls of tombs of the period (see MASTABA) show a remarkable degree of civilization. Unger (*Manetho*, p. 92) refers to Soris-Snofru the mention made by Macrobius (*Saturnalium convitiarum*, lib. i., 23, § 10) of Senemures or Senepes, whose name in turn has been compared by some with that of the Assyrian Semiramis. The entire identification is founded on conjecture.

CHARLES R. GILLET.

*Sorites*: See *Logic*.

*Soroban*: the Japanese abacus. It differs from the Chinese *su-an-p'an* in having, as a rule, only one bead on each wire of the upper or smaller division. It is used in the same way as the Chinese use theirs. See *ABACUS*.

*Sorocaba*: a town of the state of São Paulo, Brazil; on the Sorocaba river, a branch of the Tietê; 60 miles W. of São Paulo, with which it is connected by railway (see map of South America, ref. 6-F). It is the center of an important agricultural and grazing district, and is noted for its annual fairs, principally devoted to the sale of horses and mules; as many as 70,000 animals are sometimes placed on sale. Pop. about 12,000.

H. H. S.

*Sorrel*: any one of several sour-leaved plants, especially those of the diacious section, of the genus *Rumex* (family *Polygonaceæ*), to which genus the coarse herbs called dock also belong. The common sorrel of sterile fields is *Rumex acetosella*. Plants of the genus *Oxyria* (of the same family) are called mountain-sorrels. The wood-sorrels are of the genus *Urtica* (family *Geraniaceæ*). There are numerous species of the genus *Rumex*, some of which are occasionally used as salad-herbs and as flavors for sauces. In Europe the sorrels, mountain-sorrels, and wood-sorrels are cultivated in gardens for table use. All these sorrels owe their sourness to the presence of oxalic acid and its salts.

Revised by L. H. BAILEY.

*Sorrel-tree*, or *Sourwood*: the *Oxydendrum arboreum*, a handsome tree of the U. S., found in Ohio and Pennsylvania and southward to the Gulf. Its leaves resemble those of the peach. They are sour, and from them a cooling drink is made for the sick. The wood is soft and very difficult to dry. It is sometimes planted as an ornamental tree.

*Sorren'to* (anc. *Surrentum*): town: in the province of Naples, Italy; situated on a small rocky peninsula on the south side of the Bay of Naples, protected from the sirocco by Monte Vico, and from the west wind by Monte Massa (see map of Italy, ref. 7-F). It contains an interesting church and numerous villas, with gardens of almost tropical luxuriance. It was a Greek settlement, was adorned with splendid temples during the Roman period, and after the fall of the Western empire was ruled by its own consuls and dukes. Of the old temples, a few fine marbles, mosaic pavements, etc., alone remain, besides the foundations. The climate of Sorrento, as agreeable as it is salubrious, the luxuriance of the vegetation, and the variety and beauty of the surrounding scenery, have made Sorrento one of the most frequented resorts in Southern Italy. There is a small coasting trade in the rich productions of the vicinity carried on by means of the little harbor. It is the birthplace of Torquato Tasso. Pop. about 6,090.

*Sotades*, sot'â-dêez (Gr. *Sotádēs*): Greek poet of Macedonia in Thrace; a composer of indecent farces, whose jest at the marital relations of Ptolemy Philadelphus and his sister Arsinoë cost the jester his life. Sotades has given his name to a variety of Ionic verses, the *Metrum Sotadeum*. The fragments have been collected and restored by G. Hermann. *Elementa Doctrinæ Metricæ*, p. 445.

B. L. G.

the soul implies a definition of soul as including not only its phases of corporeal existence, but also the higher ones of thought and will. Hence if *ψυχή* (soul) be only the principle of organic life, and *νοῦς* (reason) be the principle of intelligence elevated above the former and transcending it, the immortality of the former is precluded by definition, for the principle of conscious individuality is placed in the latter.

Previous to Aristotle and Plato the theories regarding the soul were mostly crude suggestions. The Pythagoreans thought that the soul is a harmony—that it dwells in the body as in a prison, being confined there for punishment. Many conjectures as to the location of the soul have been made. Alcmaeon of Crotona (according to Theophrastus) taught that the soul was located in the brain, "whither all sensations were conducted from the organs of the senses through canals." Like other Pythagoreans he held that the soul was subject to eternal motion, like the stars. Philolaus the Pythagorean held that the soul is united to the body, which is its organ, and at the same time its prison, by number and harmony, all things being known through number as a common principle of the soul and of things—like being known by like. Anaxagoras attributed souls to plants, and affirmed that they sorrow and rejoice. Democritus, who explained everything through the "atom and the void," held soul and fire to possess "round atoms," because they manifested the maximum of mobility. He affirmed that thought arises when the motions of the soul are "symmetrical"; and, further, that "the soul is the noblest part of man; he who loves its goods, loves what is most divine. He who loves the goods of the body, which is the tent of the soul, loves the merely human." Critias the Sophist considered the blood to be the substratum of the soul. Plato (in the *Phaedrus*) makes three souls or phases of the soul: (a) the appetitive soul seeking happiness or sensual pleasure, the gratification of desire; (b) the irascible or courageous soul, manifesting itself in combative activity, as the former in passive receptivity; (c) the rational soul, which alone is immortal. The cognitive or rational soul is the soul in its totality, and the irascible and appetitive souls are merely phases of arrested development occasioned by the confinement of the body. The rational soul dwells in the head (agreeing with Alcmaeon), the irascible in the heart, the appetitive in the organs of nourishment and reproduction. Plato defines (*Leg.*, cap. 10) the soul as a self-moving activity (*κίνησις αὐτῆς κινουμένη*). Transmigration of souls (*Phædo*), a doctrine apparently borrowed from Egypt and the Orient, is consonant with his theory of the pre-existence of the soul, and of the origin of the appetitive and irascible phases of the soul through the descent of the rational soul into a body. Having made the discovery of general and necessary ideas, which could not have originated in sense-perception, he undertook to account for them through reminiscence; the soul had perceived them in a former life. These ideas, *a priori*, were simple and eternal: how could the soul in which they were contemplated be other than simple and eternal? While he condemned the Pythagorean view that the soul was a harmony, Plato employed symbolic expressions quite similar. In the same spirit his successor in the Academy, Speusippus, defined the soul as "extension, shaped harmoniously by number"; hence as, in some higher sense, a unity of the arithmetical and geometrical. So, too, Xenocrates of Chalcidion, the second director of the Academy, taught that the soul is a self-moving number. Aristotle repudiated the use of symbolic language in definitions to avoid ambiguity. He defined soul (*De An.*, ii., 1) as "the first entelechy [self-actualizing energy] of a physical, potentially living and organic body." The first entelechy is not a fully realized being, and hence it has been inferred that he intended to exclude the reason (*νοῦς*) from his definition of the soul, especially, too, as he makes the *νοῦς* to be independent of the body. But in another place he makes the soul to be "that by which we live, feel or perceive, move, and understand." The *νοῦς ποιητικός* = the *actus purus*, or pure reason, exists before the body, and enters it from without (*θύραθεν*) as something divine and immortal (*De Gen. et Corr.*, ii., 3). The *νοῦς παθητικός* = passive reason, including the nutritive (vegetable), sensitive (animal), and so much of the rational soul as includes memory, imagination, sense-perception, and discursive intellect, he regarded (*De An.*, ii., 2) as perishable like the body. Exactly what he meant by this was long in dispute. Alexander of Aphrodisias, the great commentator, held that the active reason is the world-soul, and that individuals are mere incarnations of it which

perish with the body. Dicaearchus of Messene, pupil of Aristotle, had held this doctrine. The Stoics had held nearly the same doctrine, acknowledging that the soul outlives the body, but is not eternal. Cleanthes the Stoic asserted that all souls would exist until the general conflagration of the world; but Chrysippus limited this to the souls of the wise, while Panætius denied the future life altogether. The statements of Aristotle, taken together, indicate his belief in the existence of the soul independent of the body; and not merely as a general world-soul, but also as individual souls.

In the process of education, culture, or self-development the individual gradually eliminates his lower phases of thought; he depends less upon sense-perception, learning to know a great deal from seeing very little (Cuvier could describe the whole animal from one of its bones; Agassiz, a fish from one of its scales); mechanical memory likewise becomes less important as deduction from principles becomes more prominent; discursive intellect gives place to pure intellect. Thus the lower faculties die out, and give place to more perfect forms; they become useless in the presence of more adequate forms of cognition. Hence Aristotle was correct in describing them as transient and perishable like the body; and yet he did not at all deny, by this, future conscious identity to the individual. The active reason could energize as nutritive, locomotive, appetitive, and sensitive, organizing a new body; for organization was only a self-limitation of the active reason, a self-arrested development of it. Hence when Averroës revived the doctrine of Alexander of Aphrodisias, the great scholastic thinkers devoted themselves to this question until they reconciled Aristotle with himself through this theory of the union of the active and passive reasons—the former as independent and substantial, and the latter as eternally produced through its energy. Albertus Magnus held that the active reason bears within itself the vegetative, sensitive, appetitive, and motive faculties. Thomas Aquinas held, similarly, that as the soul is immaterial, it can not be destroyed through the removal of its substratum. The form-producing principle of the body, the vital force, the appetitive, sensitive, and motive powers, belong to the thinking substance, and do not inhere in the body; hence are immortal. Pure thought acts without organs; the lower functions of the soul act with organs created for temporary manifestation. This view substantially agrees with that of the Neo-Platonists, except as to the origin of the soul. "The soul is immaterial, and whole or entire in every part of the body"; this statement is constantly repeated by thinkers since Aristotle. Plato's doctrine of pre-existence and reminiscence is indorsed by some of the Platonizing Christian thinkers like Origen, Synesius, and Nemesius, but is generally repudiated, as by Arnobius, Justin Martyr, Gregory of Nyssa, St. Augustine, Æneas of Gaza. With Descartes, thinking substance is so sharply distinguished from matter that only divine intervention will account for their interaction. Geulincx, Malebranche, and Leibnitz presented different solutions of this dualism, but Spinoza boldly denied it altogether, making mind and matter two attributes of one substance. La Mettrie, a pupil of Boerhaave, observing the effect of the increased circulation of the blood upon his thoughts during a fever, concluded that psychical functions are all to be explained by the organization of the body. Diderot held that atoms are endowed with sensation, and that when combined in the animal organism they become conscious, thus reviving the doctrine of Democritus and Epicurus, who made the soul material, and perishable upon the separation of its constituent atoms. Carl Vogt makes the phenomena of the soul to be functions of the brain and nerves. Moleschott and Büchner have promulgated and popularized the same doctrine. Kant endeavored to show that the metaphysical argument which proved the immortality of the soul from its nature as simple substance is a paralogism, because the Ego which thinks is subject only, and does not appear as object in consciousness. Herbart, however, defends the idea of the soul as a simple, spaceless essence; and his disciple, Beneke, expounds the same doctrine. Trendelenburg returns to the Aristotelian definition: "The soul is a self-realizing, teleological idea; not a result, but a principle." At present there is a very great activity on the part of the physiological school of writers, who are engaged in investigating the physical correlates of psychical action. See articles on PSYCHO-PHYSICS, PSYCHOMETRY, PSYCHOLOGY, HYPNOTISM, IMMORTALITY, and other special topics relating to the soul.

WILLIAM T. HARRIS.

changes, were the bases of the modern states. Martim Afonso himself received a grant of the most important of these captaincies, that of São Vicente, then comprising all of Southern Brazil. He did not personally return to it, but it flourished under governors whom he selected. He was admiral of the seas of India 1534-40, and gained there several brilliant victories; in 1542-45 he was governor of the Portuguese East Indies. D. in Lisbon, July 21, 1564.

HERBERT H. SMITH.

**South, ROBERT, D. D.:** preacher and controversial writer; b. at Hackney, London, England, in 1633; studied as a king's scholar at Westminster School under Dr. Busby; entered Christ Church, Oxford, and graduated 1654 (D. D. 1663); took orders in the Church of England 1658; was university orator 1660; became chaplain to the Earl of Clarendon and tutor to his children 1661; was made prebendary of Westminster 1663; chaplain to the Duke of York 1667; canon of Christ Church 1670; chaplain to Lawrence Hyde (afterward Earl of Rochester) 1676, and accompanied him on an embassy to John Sobieski, King of Poland, 1677; became on his return rector of Islip, Oxfordshire, 1678, and soon afterward chaplain to King Charles II.; was a vigorous advocate of passive obedience and of the divine right of kings, and a powerful opponent of Dissenters, and was esteemed one of the most eloquent preachers of the time. D. in London, July 8, 1716. He caused much talk in his time by his controversial publications against Rev. Dr. William Sherlock, dean of St. Paul's, whom he accused of tritheism. He published collected editions of his sermons (London, 1692, 6 vols.; 4th ed. 1715; new ed. enlarged 1744, 11 vols.; edited by W. G. T. Shedd, New York, 1867, 5 vols.). See his complete works, with memoir (Oxford, 1823, 7 vols.; new ed. 5 vols., 1842). A selection, with memoir, appeared in London 1867.

Revised by S. M. JACKSON.

**South African Republic, formerly Transvaal' Republic:** one of the independent Boer states in South Africa, lying between the Vaal river on the S., the Limpopo river on the N., between the Portuguese coast possession on the E., and British Bechuanaland on the W. By treaty with Great Britain (1884 and 1890) the New Republic formed by the Boers in Zululand, and a small part of Swaziland and Amatongaland, were added to the South African Republic, which has an area of 113,642 sq. miles and a white population (estimated 1895) of about 200,000. The black population is estimated at about 375,000, East Bechuanas and various other Kaffir tribes. On Feb. 21, 1895, Swaziland was annexed to the republic. It has an area of 6,150 sq. miles, and a population of 60,000 natives, besides 600 (in winter 1,500) whites.

**Physical Features, Products, etc.**—The country is a healthy, high, and undulating plateau, with wide-spreading hill and mountain features extending through the interior, from the southern border almost to the northern frontier. It is abundantly timbered near its eastern border. Its western and northwestern portions are steppe-like in character. Its best agricultural resources are found on the high, well-watered plains of the southern portion, and the greater part of the country is well adapted for farming and stock-raising.

The Boers are pre-eminently stock-raisers and their sheep and cattle form their principal wealth. Great as the resources of the country are, the Boers are not yet able to supply all the food required by the enormous influx of gold-miners. About 50,000 acres are (1895) under cultivation.

The southern and southeastern districts are the greatest centers of South African gold-mining, and in a few years have made South Africa the third largest gold-producer in the world. The output in 1892 was 1,325,394 oz., by far the greater part of which came from the Witwatersrand and Barberton districts; in 1893, 1,610,335 oz.; in 1894, about 2,200,000 oz. In 1886 the site of Johannesburg on the Witwatersrand was occupied by a few huts where now (1895) stands a city of 50,000 inhabitants. The capital is PRETORIA (q. v.). Excellent coal is also found; lead and silver are being mined, and there are rich resources of iron. In its mineral and agricultural resources the republic is one of the richest regions of like extent in the world, but, except in gold-mining, little has yet been done to develop its natural wealth.

The total mileage of railways open in Sept., 1894, was 422, under construction 391, and projected 473. The line from Capetown to Kimberley has been extended to Pretoria. The extension of the Natal line from Charlestown

on the southern frontier to the capital was to be opened in 1895, and the railway from Delagoa Bay was being built W. toward Pretoria. The more important articles of export are gold, wool, cattle, grain, skins, leather, fruit, tobacco, butter, brandy, ostrich-feathers, ivory, silver, lead, and copper. The revenue and expenditure in 1894 were £1,859,582 and £1,595,757, respectively; imports, 1893, £5,371,701, exports about £5,000,000. The public debt on Sept. 15, 1894, was £9,458,966.

**History.**—For the early history of the Boers, who are of Dutch and Huguenot descent, see CAPE COLONY. A number of them, who had left Cape Colony for Natal, again removed from under British rule and founded the South African Republic, which was recognized as a free state by the British, in 1852. In consequence of trouble with the natives it was annexed by the British in 1877; but in 1880 the Boers revolted, and in 1881 the retrocession of the country took place under British suzerainty, which underwent a modification in 1884. Since then there has been a great immigration of British subjects, who form (1895) the majority of the whites; and considerable difficulties have arisen from the attempts of the Government to enforce military service on them, though they are debarred from the franchise. There have been frequent wars with the Kaffirs, who in 1894 suffered a severe defeat Aug. 29.

See Greswell, *Geography of Africa, South of the Zambesi*; Keltie, *The Partition of Africa*; Mather, *Zambesia*, and Silver, *Handbook of South Africa*. C. C. ADAMS.

**South Amboy:** borough (founded in 1835); Middlesex co., N. J.; on Raritan Bay at the mouth of the Raritan river, and on the Penn., the N. Y. and Long Branch, and the Raritan River railways; 37 miles S. W. of New York city, 60 miles N. E. of Philadelphia (for location, see map of N. J. ref. 3-D). It is a large coal-shipping point, and contains Baptist, Methodist Episcopal, Methodist Protestant, Presbyterian, Protestant Episcopal, and Roman Catholic churches, two large public schools, a large Roman Catholic parochial school, asphaltum-works, several potteries, clay-pits, sand-pits, a national bank with capital of \$500,000, and a weekly newspaper. Pop. (1880) 3,648; (1890) 4,590, (1895) estimated with enlarged territory, 5,000.

M. N. ROLL, EDITOR OF "CITIZEN."

**South America:** See AMERICA, SOUTH.

**Southampton, county of England:** See HAMPSHIRE.

**Southampton:** seaport in Hampshire, England; on a peninsula, at the head of Southampton Water; between the estuaries of the Test and Itchen; 23 miles N. W. of Portsmouth and 79 miles by rail S. W. of London (see map of England, ref. 13-H). Of the walls built in the time of Richard II. there are considerable remains, and four of the seven gates are well preserved. Southampton contains many old buildings, among which is the *Domus Dei*, an hospital dating from the thirteenth century; also St. Michael's church (1080), since altered and restored. Among modern structures are the Watts Memorial Hall (1876); St. Mary's Church, designed by Street; and the Hartley Institution, a college with thirteen teachers. The old docks (1842 and 1851) have been greatly improved and extended, and a new tidal dock, 18 acres in extent, was opened in 1890. There are also four dry docks. A graving-dock, the largest in Great Britain, was opened in 1895. Mail steamers for the U. S., the West Indies, Brazil, and South Africa arrive and depart here, and vigorous efforts have been made to compete with Liverpool in this respect. There are large exports of British manufactures. Provisions, etc., from France and the Channel islands, and cattle from Spain and Portugal are imported. In 1893 the total tonnage entered and cleared exclusive of that coastwise, was 2,130,753. Ship-building and the manufacture of engines are carried on. About a mile N. was the Roman station of Clausentum. The present town was founded by the West Saxons soon after 495; it is mentioned as Hantune in Domesday Book. The parliamentary borough returns two members. Pop. of the municipal borough (1891) 65,325.

R. A. ROBERTS.

**Southampton (P. O. name SAUGEEN):** a port of entry of Bruce County, Ontario, Canada; at the mouth of Saugeen river, on Lake Huron; 60 miles N. by E. of Goderich (see map of Ontario, ref. 3-C). It is the northwest terminus of the Wellington, Grey, and Bruce Branch of the Grand Trunk Railway. Grain and lumber are the chief exports. Pop. 1,300.

**Southampton:** village (incorporated in 1894); Suffolk co., N. Y.; on the south shore of Long Island, between

for years, at others coming in torrents for a few minutes or an hour or two. In general the colony is very healthful for colonists, but the northern coasts have the usual malarial diseases of a virgin tropical soil, with heavy rainfall. These are found to disappear in time after the soil is cultivated.

**Minerals.**—The mineral products of South Australia for 1892, and the entire production to the end of 1892, with the percentage of the total Australasian product, are given in the following table:

| MINERALS.           | IN 1892. |           | TOTAL TO END OF 1892. |           |
|---------------------|----------|-----------|-----------------------|-----------|
|                     | Value.   | Per cent. | Value.                | Per cent. |
| Gold.....           | £226,284 | 0·020     | £1,430,622            | 0·004     |
| Silver.....         | .....    | .....     | 101,727               | 0·007     |
| Copper.....         | 175,535  | 0·582     | 20,162,292            | 0·773     |
| Tin.....            | 2,438    | .....     | 20,812                | 0·001     |
| Coal.....           | .....    | .....     | .....                 | .....     |
| Other minerals..... | 2,769    | 0·005     | 402,824               | 0·134     |
| Totals.....         | £216,079 | 0·025     | £22,118,236           | 0·049     |

The most important mineral product is copper, and the colony owes its continued existence at a critical time to the opportune discovery of the famous Burra Burra copper-mining district, 90 miles N. of Adelaide. The mines were developed in 1845 and for some years paid their owners 800 per cent. on the investment, but were temporarily abandoned in 1864 because of the difficulty of transport, and reopened on the construction of the railway from Adelaide to Kuringa. There is a rich and large copper district 300 or 400 miles N. of Adelaide. Gold is obtained from mines in the southern hills S. of Adelaide (at Echunga, etc.), at Wakaringa, about 225 miles N. of Adelaide, and at other places, but chiefly from the Northern Territory, where there is a large alluvial and auriferous quartz region 100 to 150 miles S. of Port Darwin. Gold was discovered in the colony in 1852, the year after the rush to the Ballarat fields. The production of silver, never large, has nearly ceased. Among the other valuable or interesting minerals may be mentioned iron, marble, gypsum, mica (in the McDonnell range), garnets, and coorongite, an elastic mineral similar to elaterite, discovered in the Coorong lagoon on Encounter Bay.

**Agriculture.**—South Australia is essentially an agricultural and pastoral country. The value of the crops for the season 1892-93 was approximately £3,327,286, less than the corresponding values in Victoria, New Zealand, and New South Wales, but more than for the other Australasian colonies. The value of the crop per acre was £1 12s. 8d., the least in the seven colonies, the greatest being Tasmania, where it is £5 15s. 1d.; but the value per head of population was nearly £10, the greatest in the seven colonies. In the season of 1892-93 the total area under crops was only one-third of 1 per cent. of the area of the colony, or 2,037,653 acres. Three-quarters of this was in wheat, 21 per cent. in hay, and only fractions of 1 per cent. in each of the other crops—vines, oats, barley, and potatoes. The area of land under cultivation has increased fivefold since 1861, about the same ratio as that throughout Australasia. Wheat is the staple crop, but the production per acre was only 6·1 bush. in 1892-93, while it was 22 bush. for New Zealand, and nearly 11 bush. for all Australasia; yet owing to favorable conditions of culture 7 bush. in South Australia is considered a satisfactory crop. The colony exported 4,000,000 bush.—as wheat or flour—in 1892. The average yield for oats was 11 bush. per acre, for barley 13 bush., for potatoes 4 tons (worth £10), of hay less than 1 ton per acre. Considerable attention is paid to the vine. In the season of 1891-92 594,000 gal. of wine and 3,640 tons of table-grapes were produced. About 80 gal. of wine per acre was the product for bearing vineyards—about that of Italy and Hungary.

The importance of irrigation has long been recognized in the other colonies, but only recently has it been attempted on a large scale in South Australia. In 1888 a private company began operations at Renmark, on the river Murray, close to the boundary of New South Wales, where an area of 250,000 acres was set apart for this purpose. Search for artesian sources of water has been carried on successfully. On the Nullarbor Plain, a part of the Victoria Desert, and near the shores of the Australian Bight, a well was drilled 777 feet and yielded 68,000 gal. per diem, and other wells have since brought water near to, or above, the surface. More successful are the wells near the central portion of the colony, and those at Herrgott Springs, Coward, Strangways, and Lake Harry give from 50,000 to 1,200,000 gal. a day.

The live stock possessed by the colony in 1892 gave a product valued at £3,086,930, or about 6 per cent. of that for all Australasia, and £9 6s. 5d. per head of population. Over 40 per cent. was given by the wool-clip alone. The number of animals in 1893 was: Sheep, 7,325,003; cattle, 675,284; horses, 201,484. In general, the number of stock is increasing nearly 3 per cent. yearly, and somewhat less rapidly than the population, but the number of swine is decreasing. The number of animals held by this colony is from 5 to 7 per cent. of those of Australasia, except the horses, of which the number is 11 per cent. The capacity of the colony for sheep is probably nearly reached, as the area adapted for them is relatively small and is being encroached upon by tillage. Should the expectation of finding artesian water over the arid regions generally be realized, however, an enormous area of land now worthless would be easily rendered suitable for tillage and pasture.

**Population.**—The population in 1844 was 17,366; in 1891, 320,431. Of the latter, 4,895 belonged to the Northern Territory, and 133,220 to the capital, Adelaide. On Dec. 31, 1893, the total population was 341,978 (177,219 males, 164,759 females), and that of Adelaide 140,549. In 1886 the number of aborigines living in the settled districts was 3,869. In 1891 the number was 3,134 (1,661 males, 1,473 females), and of Chinese 3,848 (adult males). In 1892 the number of marriages was 2,119; of births, 10,544; of deaths, 3,711; of immigrants, 15,688; of emigrants, 14,499.

The number of churches and chapels in the colony in 1893 was 1,061. As to religious denominations, the population in 1891 was divided as follows: members of the Church of England, 89,271; Wesleyans and Methodists, 50,813; Roman Catholics, 47,179; Lutherans, 23,328; Presbyterians, 18,206; Baptists, 17,457; Bible Christians, 15,762; Congregationalists, 11,882; Jews, 840. There is no state aid to religious establishments.

Education is compulsory and regulated by the state, but not free. In 1893 there were 273 public schools, 333 provisional schools, and 254 private schools, with an aggregate of 67,949 pupils; also a normal college and the University of Adelaide (founded in 1872).

In 1891 there were 28,847 persons (886 women) engaged in agriculture, 5,332 in pastoral pursuits, 582 in fisheries, and 4,992 in mining industries; 37,680 were engaged in other industrial pursuits, 26,209 in commercial, and 7,266 in professional pursuits.

**Commerce.**—Exclusive of bullion and specie, the value of the total imports in 1893 was £7,934,200, and of the exports £8,463,936, in both cases an increase on the preceding year. The principal exports are wool (£2,001,297 in 1893), wheat and flour (£1,063,760), and copper ore. The trade is almost entirely with the United Kingdom and the other Australasian colonies. The chief imports are iron, clothing, cottons, woollens, and machinery. In 1893 948 vessels entered and 971 cleared from the ports of the colony, and there were 212 sailing vessels and 92 steamers registered in it.

In 1893 there were 1,831 miles of railway in the colony, nearly all under state control. In 1886 the connection between Adelaide and Melbourne was completed, thus putting this colony in railway connection with the eastern colonies. In 1893 the transcontinental line between Adelaide and Port Darwin was completed from the S. to Oodnadatta, 686 miles N. of Adelaide, and from the N. to Pine Creek, 151 miles. Between these two places there remains 1,140 miles to be constructed. Aside from this the railways are all in the southeast corner of the colony. At the end of 1893 there were 5,546 miles of telegraph and telephone in use, with 13,082 miles of wire. This includes the 2,000 miles in the transcontinental telegraph line from Adelaide to Port Darwin, where connection is made with a cable to India and Europe.

**Administration.**—The executive functions are vested in a governor appointed by the crown and an executive council of six responsible members, viz., the chief secretary, premier and attorney-general, treasurer, commissioner of crown lands, commissioner of public works, and minister of education and agriculture. The constitution (dated 1856) vests the legislative power in a parliament of two houses—the Legislative Council, now of 24 members, each elected for nine years, and the House of Assembly, of 54 members, elected for three years. Each member of the council and assembly receives £50 a year and a free pass over the Government railways. There are 44 counties, 4 extensive pastoral districts, 33 municipalities, and 140 district councils in South Australia proper.

**South Caroli'na:** one of the U. S. of North America (South Atlantic group); the eighth of the original thirteen States that ratified the Federal Constitution; popularly known as the Palmetto State.

**Location and Area.**—It lies between lat. 32° 04' 30" and 35° 13' 02" N., lon. 78° 28' and 83° 18' W.; is bounded on the N. and N. E. by North Carolina, on the S. E. by the Atlantic Ocean, on the S. W. and W. by Georgia; coast-line, 210 miles; longest meridian and longest parallel, about 225 miles each, intersecting near Columbia; area (U. S. census), 30,570 sq. miles (19,564,800 acres), of which 400 sq. miles are water surface.

Seal of South Carolina.

geologic break, passing through the State near Cheraw, Columbia, and Aiken, divides it into the "up country" and the "low country," and the two regions show marked differences. The up country is Primary in formation; the low country, Tertiary, with occasional Cretaceous outcroppings. The State is further divided by Mill (1825) and Hammond (1883) as follows: I. The Alpine region (1,000 sq. miles), in the northwest, has gneiss as its characteristic rock, with granite, hornblende, itacolumite-slates, limestones, and clays. The highest peaks in the State—Pinnacle, in Pickens County (3,436 feet), Caesar's Head (3,118), Paris Mount (2,054), in Greenville, and King's Mount (1,692), in York—are capped with mica-slate, and have steep faces to the S. and E., contrary to the usual rule of the Atlantic slope. The mountains tend to break into isolated masses to the S. The soils are loams and clays, rich in lime and potash. Hills and valleys are clad in hardwood virgin forests. II. The Piedmont region (10,000 sq. miles) embraces the remainder of the up country. Excepting the Sea islands it is the most thickly settled portion of the State, and contains the center of white population. The surface is rolling, rising in places to 800 feet. Granite outcrops in three great parallel ridges. That of Fairfield has a national reputation for hardness, beauty, and ease of cleavage. Trappean rocks underlie large tracts of comparatively level lands. This region contains slates, and quartz is abundant as a surface-rock. The soil is chiefly granitic and porphyritic clays, with gray sands and clay-slates. A tenacious subsoil preserves fertility. The Alpine and Piedmont regions contain gold in paying quantities (Dorn's mine in Edgefield County and Brewer's in Chesterfield having yielded more than \$1,000,000 each), besides copper and some silver. Inexhaustible deposits of iron have been partially developed. Limestone, baryta, whet-stone, and flagging-stone have been quarried. Graphite, itacolumite, asbestos, feldspar, spinel rubies, corundum, and beryl exist. III. The Sandhill or Pine region (2,000 sq. miles), the beach of a former age, stretches across the State. Generally level, it rises in the high hills of the Santee to 700 feet. Ironstone, sandstone, buhrstone, and kaolin of great purity outcrop in great beds of sand, whose want of tenacity is unfavorable to vegetation. IV. The Red Hills (1,500 sq. miles), skirting the sandhills, are Eocene, having red clays, yellow sands, buhrstone, and a stone resembling melinite, with excellent fire-clay and inferior lignite. V. The Upper Pine-belt (5,000 sq. miles), varies in breadth from 20 to 40 miles, and comprises some of the finest farming lands of the State. It contains both gray and "mulatto" or chocolate lands, and is comparatively level, rising only to 250 feet. Here was produced the largest yield of corn (256 bush. to an acre) ever gathered. VI. The Lower Pine-belt (9,000 sq. miles) comprises the lower tiers of counties, excepting the salt-water region. The soil is Tertiary. Here occur the famous phosphate deposits lying between Charleston and Beaufort, in river-beds and inland strata, 2 to 10 feet below the surface. They are the detritus of marl-beds subjected to aqueous action. VII. The Coast-region (1,500 sq. miles) is Post-Pliocene, resting on Eocene and Pliocene.

A sand-ridge fronts the sea, backed by expanses of mud or sandy loams. Many creeks between Savannah river and Winyah Bay afford inland navigation and form islands which, when drained, are extremely fertile and healthful. The chief of these are Hilton Head, St. Helena, Edisto, John's, James's, North, and South islands. Sullivan's and Pawley's islands are sand-bars noted for surf-bathing.

**Rivers and Bays.**—The up country is hilly, with some level expanses, once prairies. Straight streams have a fall of 4½ feet to the mile, with rapids along the geologic break impeding navigation, but furnishing abundant water-power. The Catawba river falls 178 feet in 8 miles. The Columbia Canal on the Congaree has developed 13,000 horse-power. A potential energy of 1,000,000 horse-power exists in the State. The low country, while having a greater general slope to the ocean, is less undulating. Winding, sluggish streams, with a fall of a few inches to the mile, overflow in floods an area of 5,000 sq. miles. There are 2,400 miles of inland navigation, which might be increased by canals around the rapids. The chief rivers are the Savannah, the Santee (formed by the Congaree and Wateree, the Congaree formed by the Broad and the Saluda, and the Wateree known as the Catawba in its upper course), and the Pee Dee system, consisting of the Great Pee Dee (the Yadkin in North Carolina), the Little Pee Dee, Lynch's, Black, and Waccamaw. The Ashley and the Cooper rivers, forming Charleston harbor, the Edisto, Ashepoo, Combahee, and Coosawhatchie are smaller streams. There are no important lakes. The chief inlets are Port Royal, St. Helena, Stone, Charleston harbor, Bull's Bay, and Winyah Bay. Cap Roman is the chief promontory. Port Royal has one of the finest harbors in the world, with 21 feet of water at low tide, and a mean rise and fall of tide of between 7 and 8 feet. By jetties begun in 1878 Charleston bar has been deepened to 17 feet at low tide and 23 feet at spring tides. The north jetty is 15,443 feet long, and the south 10,104 feet. Their cost up to 1894 was \$3,600,000. Winyah Bay, leading to Georgetown, has 7 feet at low tide, and 10 to 12 feet at high.

**Fauna and Flora.**—Hammond's *Handbook of South Carolina* (1883) gives a list of 48 mammals, 179 birds, 43 serpents, 23 lizards and turtles, 44 amphibians, and 196 fishes, besides thousands of invertebrates not classified. There are 1,310 endogens, 500 exogens, and 2,582 cryptogams. Buffaloes and beavers, once plentiful, are extinct. A few bears and wolves are reported. The magnolia and the palmetto beautify the coast, and the orange, banana, olive, almond, and tea-plant are grown here. Pine and cypress characterize the low country, hardwoods the up country. All nuts, fruits, and berries of the temperate zone grow wild or can be cultivated here. Peaches, apples, grapes, and plums are the commonest fruits.

**Staple Productions.**—Cotton, maize, wheat, rice, peas, hay, and sweet potatoes are the chief staples. The Sea islands grow 10,000 bales of the famous long-staple cotton per annum, and the fields produce from 500,000 to 750,000 bales of the short staple. In 1894 the cotton crop amounted to 787,808 bales, and the rice crop to 11,372,445 lb. Tobacco-growing, truck-farming, and fruit-growing for market are rapidly developing. Stock-raising, once profitable, then neglected, has been revived with success. Hired field-labor is largely supplied by Negroes, but there are many small farmers among the whites, especially of the Piedmont region, who work their own crops.

The following summary from the census reports of 1880 and 1890 shows the extent of farm operations in the State:

| FARMS, ETC.   | 1880.        | 1890.        | Per cent. |
|---|--------------|--------------|-----------|
| Total number of farms.....                          | 93,864       | 115,008      | 22.5*     |
| Total acreage of farms.....                         | 13,457,613   | 13,184,632   | 2.1*      |
| Value of farms, including buildings and fences..... | \$68,677,482 | \$99,104,600 | 44.1*     |

\* Increase.

† Decrease.

The following table shows the acreage, yield, and value of the principal crops in the calendar year 1894:

| CROPS.           | Acreage.  | Yield.           | Value.       |
|------------------|-----------|------------------|--------------|
| Indian corn..... | 1,672,216 | 18,728,819 bush. | \$12,138,720 |
| Wheat.....       | 144,258   | 807,845 "        | 702,820      |
| Oats.....        | 339,808   | 4,077,606 "      | 2,161,754    |
| Rye.....         | 4,203     | 19,754 "         | 18,754       |
| Potatoes.....    | 4,208     | 248,272 "        | 100,000      |
| Hay.....         | 157,594   | 241,119 tons     | 2,392,000    |
| Totals.....      | 2,322,287 |                  | \$17,809,098 |

# SOUTH CAROLINA

**Schools.**—The first free school was established in 1710, ten years after the first public library was opened. In 1785 four colleges were provided for. Two were established, of which one, Charleston College, survives. In 1805 the South Carolina College (known as the University of South Carolina between 1866 and 1877 and 1887 and 1890) was opened in Columbia. Free schools were established in 1811, but private effort bore the chief burden. In 1860 the State ranked fifth in college endowment and sixth in college income. The war of 1861-65 closed many schools. In 1868 a public-school system was provided, which has steadily improved. The races are taught separately. In 1894 there were in round numbers 2,600 white and 1,950 colored teachers, and 106,000 white and 120,000 colored pupils. Almost every town has a graded school. The State has four higher institutions—the South Carolina College, the South Carolina Military Academy (chartered in 1842), the Clemson Agricultural and Mechanical College for males (opened in 1893), and the Winthrop Normal and Industrial College for females. These form the University of South Carolina. The total expenditure for public education in 1894 was \$790,000, which was raised by a two-mill tax, a poll-tax of \$1, and local taxes. Among the private institutions of note are the College of Charleston (non-sectarian, chartered in 1785); the Presbyterian College of South Carolina (opened 1879); Allen University (Methodist Episcopal colored, chartered 1880); Erskine College (Associate Ref. Presb., opened 1839); Furman University (Baptist, chartered 1850); Newberry College (Lutheran, chartered 1856); Wofford College (Methodist Episcopal South, chartered 1852); Wallingford Academy (Presbyterian); Benedict Institute (colored Baptist); and female colleges and institutes at Columbia, Due West, Gaffney, Greenville, Reidville, Spartanburg, Sumter, and Walhalla. Claflin University, at Orangeburg, chartered in 1872, is endowed by part of the national land grant. Charleston contains the Medical College of the State of South Carolina and the department of pharmacy of the University of South Carolina.

**Libraries.**—According to a U. S. Government report on public libraries of 1,000 volumes and upward each in 1891, South Carolina had 33 libraries which contained 183,982 bound volumes and 19,650 pamphlets. The libraries were classified as follows: General, 9; school, 3; college, 11; college society, 3; law, 1; theological, 3; medical, 1; Y. M. C. A., 1; and scientific, 1.

**Charitable and Penal Institutions.**—The State maintains a lunatic asylum, a penitentiary, and farms for convict labor. There are no reform schools. Almshouses and jails are maintained by the counties.

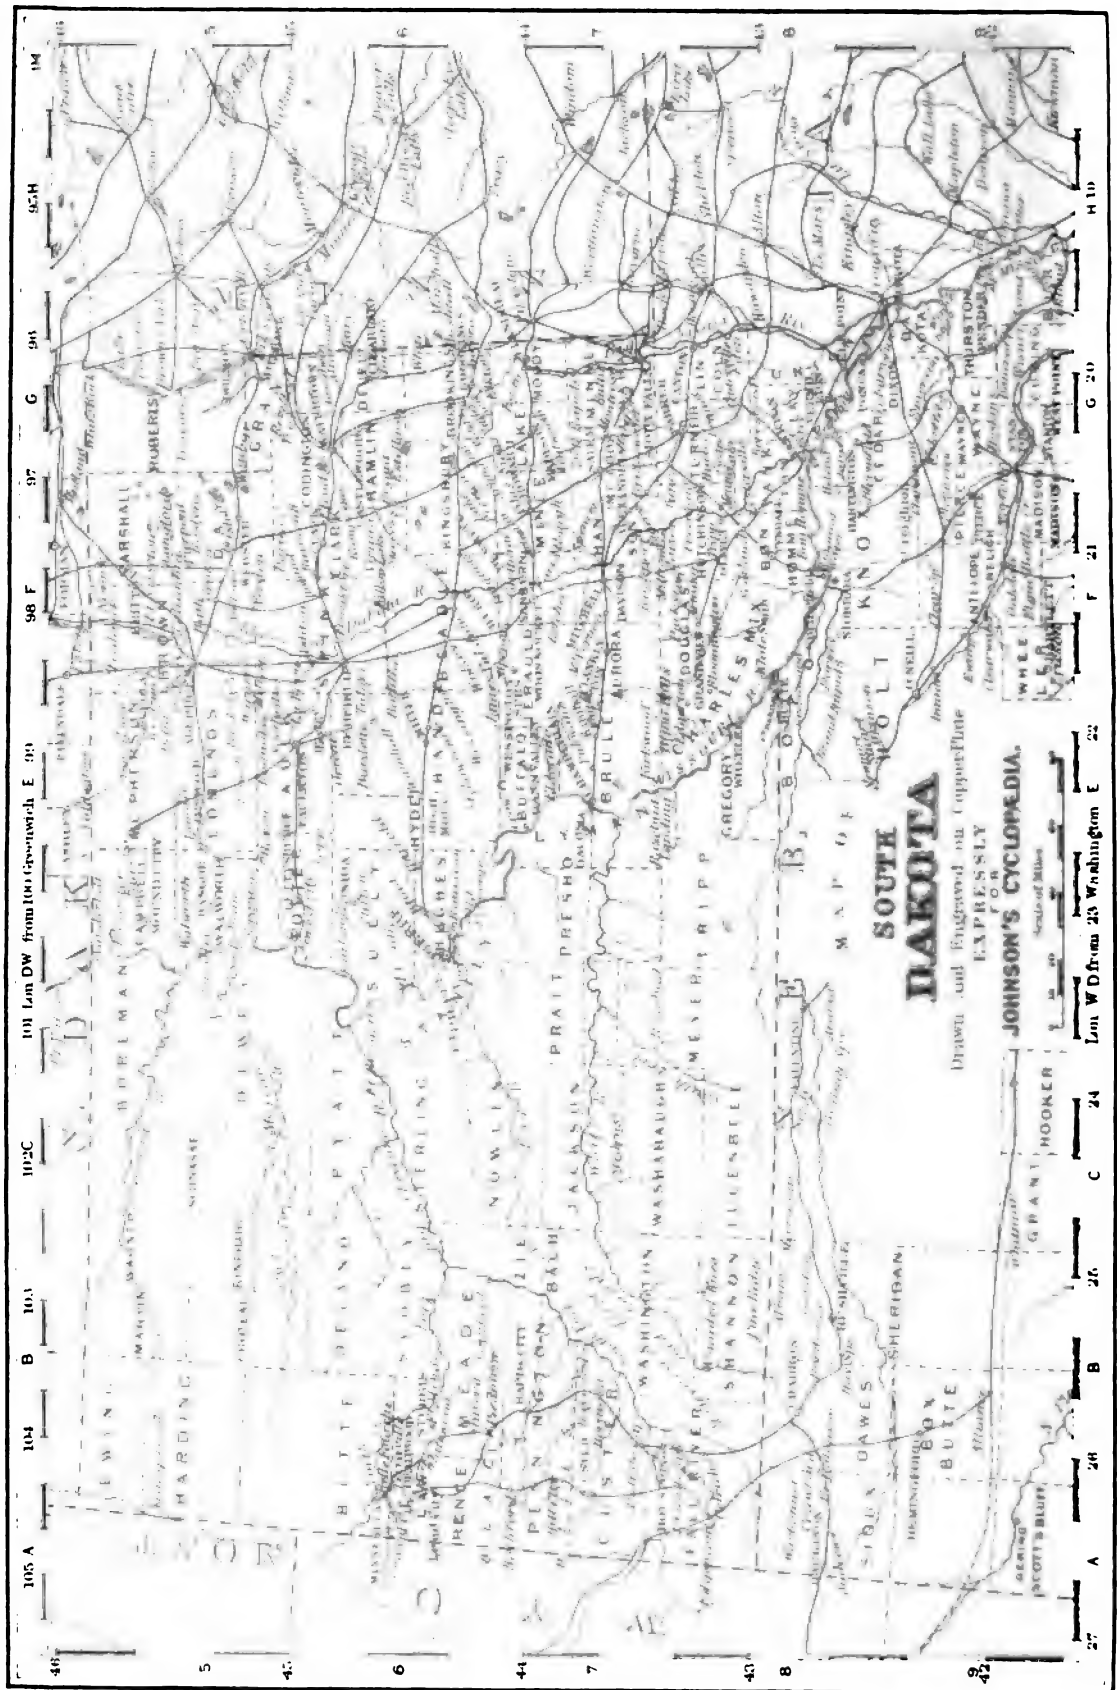

**Liquor Legislation.**—In 1892 the Legislature prohibited the sale of liquor by private persons and established State and county dispensaries. Liquors, chemically pure, put up in sealed packages, are sold by salaried county dispensers in the daytime to temperate persons, who are not allowed to open the package on the premises. The profits are divided between the State and local treasuries. Constables with extraordinary powers search for and seize illicit liquors. This law was declared unconstitutional by the State Supreme Court in 1893, but with a change in the personnel of the court the decision was soon reversed. On Oct. 31, 1894, there were 69 selling dispensaries; from July 1, 1893, to Oct. 31, 1894, \$573,000 worth of liquors had been bought by the State, and this was sold (or was to be sold) to consumers for \$679,000.

**Political Organization.**—The constitution of 1776 was changed in 1778. A third instrument, framed in 1790 and in operation till 1865, devolved most of the government upon the Legislature, which elected the Governor, State officers, and many other State officials. The constitution of 1868 gives the Governor, elected by the people for two years, great powers. A Lieutenant-Governor presides over the Senate. The Legislature, meeting annually, is composed of 36 Senators (2 from Charleston and 1 from each other county, elected for four years), and 124 Representatives, elected two years and apportioned according to population. It elects judges and a few other public officers. State and most county officers are chosen by the people. Judicial power is vested in a Supreme Court of three justices (term six years) and eight circuit judges (term four years). Circuit solicitors, county probate judges, and trial justices complete the system. All males over twenty-one years of age, except those convicted of felony, lunatics, and paupers, are allowed to vote. A strict registration law prevails. A voter who has lost his ticket must have it renewed before the next general

election or be disfranchised. Eight boxes are provided for separate groups of officials. They are labeled, and the managers must read the labels when required. Outsiders are not allowed inside the booths. Ballots must be of uniform size, color, and unmarked. Votes in the wrong box are not counted. A State board of canvassers has final jurisdiction, except for Governor and Lieutenant-Governor, whose votes are counted by the House of Representatives.

**History.**—1. *The People.*—In 1520 Spaniards visited Port Royal and kidnaped Indians. Returning five years later, they were decimated by Indians and disease and abandoned the idea of settlement. Jean Ribault attempted to establish colonies of Huguenots in 1562 and 1565, but failed. Raleigh accomplished nothing. Heath's patent was repealed for non-performance. Charles II. of England in 1663 granted lands between lat. 31° and 36° N. (extended in 1665 to lands between 29° and 36° 30') to eight proprietors, who had power to make laws with the assent of the freemen. In 1666 Sandford took possession of the land "by turre and twigge." In 1670 Sayle with three ships reached Port Royal and proceeded to the left bank of the Ashley river, where he founded Charlestown, which ten years later was removed to its present site. Locke and Shaftesbury had prepared "Fundamental Constitutions" resting on church membership and lands, but allowing toleration. The settlers swore allegiance to temporary instructions based on this draft. A second draft established the Church of England. The settlers, chiefly Dissenters, refused to accept either this or four other subsequent drafts, claiming that they had sworn to the first. After 1698 the proprietary government was conducted under the king's charter; but estrangement increased, and in 1719 a revolution overthrew the proprietary régime. The king sent Sir Francis Nicholson as first royal Governor in 1721, with instructions that were in force till the Revolutionary war. During all this time the Assembly gained power, and finally claimed all the rights of the House of Commons. In 1765 the people captured Fort Johnson, in which stamps were stored, and sent them back to England. Later they refused to allow tea to be landed and sent £3,000 worth of provisions to aid Boston. A council of safety was formed 1774, and Gov. William Campbell sailed away with the seal of the province in 1775. South Carolina heartily seconded the call for a congress, and was the first to frame a State constitution, May, 1776. In June following Moultrie, behind his palmetto fort, repulsed a British naval attack. This victory, physical as well as moral, gave respite from war for three years. The siege and fall of Charleston, 1780, were followed by partisan warfare, till the rising of the back country and the great victory of King's Mountain in Oct., 1780, forced the British slowly back to Charleston, which was evacuated Dec., 1782. Columbia was made the capital in 1790. After long debate the State made a Federal union possible by accepting conditionally the Constitution of the U. S. May 23, 1788. At this time the low country was generally Federal and the up country anti-Federal. Jefferson's doctrines gained ground, and C. C. Pinckney lost his State in the presidential election of 1800. Since then a strict-construction view has prevailed among the whites. In 1832 a convention nullified the tariff as unconstitutional and also the bill passed to enforce it. After Clay's compromise the anti-tariff ordinance was repealed, but the other was not. All State officers were required to swear paramount allegiance to the State. A small but determined minority opposed nullification. Later on, the idea of complete separation gained ground. A convention in 1852 asserted the right, but thought the occasion did not justify it. Subsequent events fanned the flame. Dec. 20, 1860, a convention unanimously declared South Carolina an independent sovereignty. With other States the Confederacy was formed. South Carolina sent 60,000 men to battle, of whom 12,000 perished. Port Royal was taken in 1861, and the coast was the fighting-ground. Charleston was besieged, but not taken until after the march of Sherman in 1865, when it was evacuated. By the war the assessed property of the State was reduced from \$550,000,000 to \$100,000,000 (\$200,000,000 being the value of the slaves set free). President Johnson appointed B. F. Perry provisional Governor and a government was formed. Congress placed the State under military rule, and ordered a convention, which in Sept., 1865, declared the secession ordinance null and void, repudiated the Confederate State debt, and framed a new constitution. A constitution was adopted in 1865 repealing the ordinance of secession and slavery. A refusal to ratify the Fourteenth Amendment led to a reconstruction by Congress. The Ne-

course along and near the southwestern edge of the great ice-sheet. W. of the Missouri the streams in the order of their size are the Cheyenne, Grand, White, Bad, and Moreau.

**Geology.**—Igneous rocks appear in a few spots, one a dike of diabase, on Split Rock creek, N. E. of Sioux Falls, and five or six small areas in the northern part of the Black Hills, and include the porphyries. The Archæan appears in the east-central part of the Black Hills, lying N. and S., with Harney's Peak a little S. of its center. A somewhat larger area enters the State from Minnesota, in width from Canton to Flandreau and narrowing westward to a point a little S. of Mitchell. There is another small area below the southeast end of Big Stone Lake. In the Black Hills it consists of schists, partly Early Huronian, and slates and quartzites, with eruptive masses of granite. The east area is red quartzite (Huronian), while near Big Stone Lake a reddish granite is exposed only under the drift. The Paleozoic rocks lie around the core of Archæan in the Black Hills, being wider on the W., and comprise 200 to 300 feet of Potsdam sandstone, about 30 feet of Trenton limestone, a few feet of clay (possibly Devonian), then 600 or 700 feet of Carboniferous limestones. The Jura-Trias encircles the Paleozoic of the Black Hills, and includes 200 to 350 feet of red marly clays with purple limestone and gypsum (Trias), and 75 to 150 feet of sandstone, marls, and clays of the Jurassic. Encircling the last-named formation in the Black Hills and bordering the larger Archæan area in the east part, broadly on the S. and W. and less on the N., is the Dakota, a formation of several thick beds of sandstone separated by layers of clay of irregular thickness. The Colorado extends from the Black Hills to a little beyond the branches of the Cheyenne, and includes the intermediate valleys and the country between the Cheyenne and Bad rivers, and nearly all the unmentioned part E. of the Missouri and a margin of irregular width along the west side of the Missouri. It represents the Fort Benton clay, 50 to 100 feet; the Niobrara chalkstone, 50 to 150 feet; and the Fort Pierre clays, 600 to 700 feet. The Fox Hills comprise 100 to 150 feet of sands, clays, and sandstone in the region near the Missouri and N. of the Cheyenne. The Laramie or lignitic is the great lignite-bearing formation, with rocks similar to the Fox Hills, in the northwest part of the State. It comes down near the Belle Fourche, extends E. half way to the Missouri, then N. E. to near that river. The Miocene covers the region S. of Bad river and E. of the south branch of the Cheyenne to near the Missouri, and includes the white clays, marls, and sandstones of the Bad Lands, known as White river beds, also the Loup Fork beds. In this State the two may be 250 to 400 feet thick. The drift or boulder clay covers all the surface W. to a line a little beyond the Missouri river, following closely its general course to within 60 miles of the northern boundary, where it deflects some 40 miles W. from that stream. The outlines of the older formations are less confidently stated where they are covered by drift. The artesian basin includes the region W. of the following line: Beginning near Vermillion on the Missouri river, thence N. W. to Ethan, S. of Mitchell, thence N. E. some 25 miles, thence a little W. of N. E. to the northwest corner of Clark County, thence N. N. E. to the northern boundary. On the S. it follows near and a little S. of the Missouri. Many powerful wells flow in the region W. of this line to the Missouri, and the pressure rises rapidly toward the W. It is probable that it extends along the White and Cheyenne rivers to near the Black Hills, where a flowing well was sunk at Belle Fourche. The water-bearing strata, the Dakota sandstone, are somewhat irregular in distribution, conducting power, and depth. The wells are used to supply towns, furnish power, and to irrigate lands.

**Productions.**—At Sioux Falls, Dell Rapids, Spencer, Rockport, and near Alexandria are extensive and valuable quarries of red quartzite, and at Yankton are extensive and thick beds of Fort Benton clay and chalkstone, from which a superior Portland cement is made. Brick clays are found in many localities. Custer County contains manganese, but there is little use for it locally, and the cost of transportation is too great to justify shipments except of the highest grade ore. Tin is found in the Harney Peak and Nigger Hill regions of the Black Hills, and the first tin-mill in the U. S. was opened near the mines in 1890. During the calendar year 1893 the Black Hills mines yielded 193,809 fine ounces of gold, valued at \$4,006,400, and 140,400 fine ounces of silver, valued at \$181,527. Very rich gold mines were

opened in 1895 near Hill City, and the aggregate product is materially increased. The granite produced by the State in 1893 was valued at \$27,828, the sandstone at \$36,165, and the gypsum at \$12,550. The Sioux Falls quartzite has been used for paving in Chicago and other Western cities with satisfactory results. The chief industry of the State is agriculture. Stock-raising has become an important interest. The State has a variety of native grasses, and many cultivated species have been introduced profitably in the unsettled parts of the east and south. In 1890 South Dakota had 50,158 farms, containing 11,396,460 acres, valued with buildings and fences at \$75,310,305. The following table shows the acreage, yield, and value of the principal crops in the calendar year 1894, a year of serious drought:

| CROPS.             | Acreage.         | Yield.          | Value.              |
|--------------------|------------------|-----------------|---------------------|
| Indian corn.....   | 354,844          | 1,490,345 bush. | \$885,700           |
| Wheat.....         | 2,414,281        | 15,934,255 "    | 7,282,777           |
| Oats.....          | 788,549          | 5,992,972 "     | 2,067,590           |
| Rye.....           | 6,550            | 29,475 "        | 15,500              |
| Barley.....        | 53,465           | 721,246 "       | 252,500             |
| Buckwheat.....     | 1,318            | 9,490 "         | 1,100               |
| Potatoes.....      | 49,330           | 1,194,590 "     | 870,700             |
| Hay.....           | 2,040,833        | 1,918,323 tons  | 8,210,570           |
| <b>Totals.....</b> | <b>5,709,170</b> |                 | <b>\$19,435,337</b> |

On Jan. 1, 1895, the farm animals comprised 293,771 horses, value \$8,608,620; 6,937 mules, value \$259,361; 278,928 milch-cows, value \$4,900,765; 425,354 oxen and other cattle, value \$6,368,775; 323,482 sheep, value \$532,969; and 173,983 swine, value \$1,012,408—total head, 1,502,435; total value, \$21,682,898.

**Divisions.**—For administrative purposes the State is divided into seventy-eight counties, as follows:

#### COUNTIES AND COUNTY-TOWNS, WITH POPULATION.

\* Reference for location of counties, see map of South Dakota.  
 † Abandoned. ‡ Now parts of other counties.

**Principal Cities and Towns, with Population in 1890.**—Soux Falls, 10,177; Yankton, 3,670; Pierre, 3,235; Aberdeen, 3,182; Huron, 3,038; Watertown, 2,672; Lead City, 2,581; Deadwood, 2,366; Mitchell, 2,217; and Rapid City, 2,128.

**Population and Races.**—The part of Dakota now in the limits of the State had in 1880 an estimated population of 98,268; in 1890 the population of the State was 328,808 (native, 237,753; foreign, 91,055; males, 180,250; females, 148,558; white, 327,290; colored, 1,518, of whom 541 were of African descent, 195 Chinese, and 782 civilized Indians).

**Manufactures.**—The census returns of 1890 showed 499 manufacturing establishments, with an aggregate capital of \$207,796 (of which \$322,855 were invested in land, \$512,142 in buildings, and \$1,329,023 in tools, machinery, and implements), employing 2,422 persons, paying \$1,098,418 for wages, \$268,214 for miscellaneous expenses, and \$3,523,840 for materials, and turning out products valued at \$5,682,748.

**Finance.**—The assessed valuations in 1893 aggregated \$36,032,840, and the total funded debt on Jan. 1, 1894, was \$1,040,200.

**Banking.**—In 1893 there were 39 national banks, with combined capital of \$2,510,000, individual deposits of \$3,754,464, and surplus and profits of \$708,838; and 135 State banks, with capital of \$1,987,053, deposits of \$3,480,688, and surplus of \$437,477. There were also over 50 private banks, which were not required to report their condition. The State banks were organized under two laws, the old ones under the general corporation law, and later ones under a new banking law, with more restrictions and safeguards.

**Means of Communication.**—Transportation to and within the State is provided by four great railway lines, the Chicago, Milwaukee and St. Paul, the Chicago and Northwestern, the Fremont, Elkhorn and Missouri Valley, and the Burlington and Missouri River, and by thirteen local and minor ones. The total mileage within the State in 1892 was 2,798, of which the greater part was operated by the four great lines in the order given. The State receives about \$50,000 annually from taxes on railway property.

**Churches.**—The census of 1890 gave the following statistics of the religious bodies having a membership of 1,000 or more each in the State:

| DENOMINATIONS.                      | Organizations. | Churches and halls. | Members. | Value of church property. |
|-------------------------------------|----------------|---------------------|----------|---------------------------|
| Roman Catholic                      | 177            | 169                 | 25,720   | \$246,020                 |
| Methodist Episcopal                 | 254            | 248                 | 11,371   | 375,290                   |
| Lutheran United Norwegian           | 148            | 138                 | 7,922    | 54,655                    |

**Schools.**—The act of Congress creating the State set apart 2,824,320 acres of land for the support of public schools, and both the act and the State constitution fixed the minimum price at which this land should be sold at \$10 per acre. More than 100,000 acres have been sold at an advance on the minimum price, and should the remainder fetch only \$10 per acre, the permanent school fund would amount to more than \$28,000,000. In 1892 there were in the State 87,317 children of school age, of whom 73,962 were enrolled in the public schools. There were 4,298 teachers, 3,253 public school buildings, 10 public high schools, 2 normal schools (at Madison and Spearfish), and public-school property valued at \$2,704,933. The institutions for advanced instruction include the University of South Dakota at Vermillion (opened in 1883); Dakota University at Mitchell (Methodist Episcopal, 1885); Pierre University at East Pierre (Presbyterian, 1883); Sioux Falls University at Sioux Falls (Baptist, 1883); Scotland Academy at Scotland (Presbyterian, 1876); Augustana College at Canton (Lutheran, 1884); Redfield College at Redfield (Congregational, 1887); All Saints' School at Sioux Falls (Protestant Episcopal, 1886); Black Hills College at Hot Springs; Academy of the Sacred Heart at Yankton (Roman Catholic); Yankton College at Yankton (Congregational, 1882); Ward Academy at La Roche (Congregational); and the Wessington Springs Seminary (Free Methodist). There are also a State Agricultural College with an experiment station near Brookings and a State School of Mines at Rapid City.

**Libraries.**—According to a U. S. Government report on public libraries of 1,000 volumes and upward each in 1891, South Dakota had 11 libraries, containing 23,366 bound volumes and 8,230 pamphlets. The libraries were classified as follows: General, 3; college, 5; scientific, 1; garrison, 1; and society, 1.

**Post-offices and Periodicals.**—In Jan., 1895, there were 667 post-offices, of which 41 were presidential (8 second-class, 33 third-class) and 626 fourth-class. There were 211 money-order offices and 21 limited money-order offices. The newspapers and periodicals in 1894 comprised 16 daily, 1 semi-weekly, 224 weekly, 1 semi-monthly, 18 monthly, and 1 bi-monthly publications—total, 261.

**Charitable, Reformatory, and Penal Institutions.**—These include a State School for Deaf Mutes at Sioux Falls; a Hospital for the Insane at Yankton; a Soldiers' Home at Hot Springs; a Reform School at Plankinton; and a State Penitentiary at South Falls; and the Legislature has authorized an additional hospital for the insane at Redfield and a school for the blind at Gary.

**Political Organization.**—The constitution vests the legislative authority in a Legislature consisting of a Senate and House of Representatives, which in 1895 had 43 and 83 members respectively. The Legislature meets biennially and sessions are limited to sixty days. It is prohibited from enacting private or special laws for granting divorces; changing the names of persons or places; constituting one person the heir-at-law of another; locating or changing county-seats; regulating county and township affairs; granting to an individual, association, or corporation any special or exclusive privilege; or authorizing any game of chance, lottery, or gift enterprise. The executive authority is vested in a Governor elected for two years. There is also a Lieutenant-Governor chosen in the same way and for the same term as the Governor. The Governor may disapprove of any separate item or items in a bill. Bills may be passed over his veto by a two-thirds vote of both houses, and those not returned by him within three days of reception become laws. The Governor is assisted in the discharge of his duties by a secretary of State, auditor, treasurer, superintendent of public instruction, commissioner of school and public lands, and an attorney-general, all elected for terms of two years. The judicial authority is vested in a Supreme Court, circuit courts, county courts, and justices of the peace, and such other courts as may be created for cities and incorporated towns. The constitution contains a "bill of rights," guaranteeing that the right to worship God according to the dictates of conscience shall never be infringed; that no person shall be denied any civil or political right on account of his religious opinions; that no person shall be compelled to attend or support any ministry or place of worship against his consent; and that no money or other property of the State shall be given for any religious or sectarian purpose. The voting privilege is extended to every male person who is a citizen of the U. S. or an alien who has declared his intention of becoming a citizen, who has resided in the U. S. one

year, in the State six months, in the county thirty days, and in the precinct ten days, next preceding any election, provided he is not under guardianship, insane, an idiot, or an unpardoned person convicted of treason or felony. Women with the foregoing qualifications may vote at any election held solely for school purposes. A modification of the Australian ballot law is in force. The constitution authorized the enactment of a State prohibition law. The Legislature passed one in 1891. It was immediately contested, and a county court declared it unconstitutional, but on an appeal in 1893 the Supreme Court affirmed its validity.

**History.**—The early history of the State is identical with that of NORTH DAKOTA (*q. v.*). In 1890-91 the Indian Messiah craze among the Sioux led to grave apprehensions, the intervention of U. S. troops, and the death of Sitting Bull, a great Sioux chief; in 1892 the Yankton Sioux Indians signed an agreement with U. S. commissioners to cede to the U. S. a large part of their reservation between the Choteau and Missouri rivers; and in 1893 the Legislature passed acts to promote irrigation, to prohibit the introduction into the State of armed bodies of police or detectives, and to create a number of State commissioners.

#### GOVERNORS OF SOUTH DAKOTA.

Arthur C. Mellette ..... 1889-93  
Charles H. Sheldon ..... 1893-

**AUTHORITIES.**—Child, *South Dakota: Resources, People, Statehood* (1888); Beadle, *Dakota* (1889); Hagerty, *The State of South Dakota: Statistical, Historical, and Political Abstract* (Aberdeen, 1889). WILLIAM H. H. BEADLE.

**South Dakota, University of:** an institution located at Vermillion by the first territorial legislature (1862), and first known as University of Dakota, but not opened by the Territory until 1883. The city and county opened an independent school in the court-house in 1882, to which they applied the original name, University of Dakota, and erected one building, which was, with the school, accepted as the territorial university by the Legislature in 1883, when the first appropriation was made. The name was changed to University of South Dakota in 1891. It has one brick and two large stone buildings, a 20-acre campus, and 86,000 acres of land. There is a College of Arts and Sciences, with four bachelor and four master courses; colleges of music and business; military and preparatory departments. It has three laboratories and a museum on the "typical" plan. The faculty consists of the president, twelve professors, and three assistants. The students number 275. J. W. MAUCK.

**Southern Crown:** See CORONA AUSTRALIS.

**Southern-wood:** a plant. See ARTEMISIA.

**Southey, CAROLINE ANNE (Bowles):** poet; b. at Lymington, Hants, England, Dec. 6, 1787. At an early age she wrote for *Blackwood's Magazine* and other periodicals. In 1820 a collection of her pieces was made, which speedily won for her a place in the world of letters. In 1839 she became the second wife of Robert Southey. *The Pauper's Deathbed* is, perhaps, the best known of her poems, which were prevailing of a moral, religious, and domestic character. Her published works are *Ellen Fitz-Arthur*, a poem (1820); *The Widow's Tale, and other Poems* (1822); *Solitary Hours*, prose and verse (1826); *Chapters on Churchyards* (1829); *The Birthday*, a poem (1836); *Tales of the Factories*, in verse; and *Robin Hood*, a fragment of a poem begun jointly by herself and her husband, to which were added other fragments by both (1847). D. at Lymington, July 20, 1854. See *Southey's Correspondence with Caroline Bowles*, by Dowden (1881). Revised by H. A. BEERS.

**Southey, ROBERT:** author; b. at Bristol, England, Aug. 12, 1774, the son of a linen-draper. Early left an orphan, he was cared for by an uncle; received his early education at Westminster School; in 1793 entered Baliol College, Oxford, with the design of taking holy orders, but, becoming unsettled in his religious and political views, left Oxford after two years, and entered upon a career of authorship in verse and prose, his first published work being a small volume of poems (1794). In 1795 he married Edith Fricker, whose sister soon after became the wife of Coleridge; set out with his uncle for Portugal; published an account of his six months' residence (1797); was made secretary to the Chancellor of the Exchequer for Ireland, a sinecure with a

salary of £350; resigned the position, and in 1804 settled for life at Keswick in the lake country. From this time his life is mainly the history of his numerous writings in almost every department of literature. In early manhood he had imbibed strong radical ideas; proposed, in conjunction with Coleridge and Lovel, to set up a socialist community or "pantisocracy" on the banks of the Susquehanna; and wrote a drama, *Wat Tyler* (printed in 1793, but first published in 1817, without his consent), which was denounced in the House of Commons as seditious. In the course of years he went over to the opposite extreme of conservatism in Church and state, and became considered the exponent of high Tory opinions. He was named poet-laureate in 1813. In 1807 he received a Government pension of £160 a year, increased to £460 in 1835. His wife, who had for several years been hopelessly insane, died in 1837, and two years afterward he married Caroline Bowles. (See SOUTHEY, CAROLINE ANNE.) But Southey's own faculties had begun to give way, and on the day when he brought his wife to their home he fell into a state of mental prostration which soon grew into complete imbecility, that continued to his death, on Mar. 21, 1843. Southey's principal poems are *Joan of Arc* (1795); *Thalaba the Destroyer*, an Arabian tale (1801); *Madoc*, founded on legends of early Welsh voyages to America (1805); *The Curse of Kehama*, based upon Hindu mythology (1810); *Roderick, the Last of the Goths*, founded on Spanish history (1814); *A Vision of Judgment*, an apotheosis of George III. (1821); and *A Tale of Paraguay* (1825). Among his numerous prose works are *History of Brazil* (1810-19); *Life of Nelson* (1813); *Life of John Wesley* (1820); *History of the Peninsular War* (1820-32); *Book of the Church* (1824); *Sir Thomas More, or Colloquies on Society* (1829); *Life of John Bunyan* (1830); and *The Doctor* (1834-37). He also contributed largely to *The Quarterly Review* for many years. His poetical works were collected by himself (10 vols., 1837), and have been several times republished in different forms. His *Life and Correspondence*, edited by his son, Rev. C. C. Southey, appeared in 1849, and a selection from his *Commonplace Book*, by his son-in-law, Rev. J. W. Warter, in 1856. Southey was one of the most indefatigable and voluminous of English authors, his published works in verse and prose numbering over 100 titles. His reputation as a poet, imposing in his own lifetime, has steadily declined. His poetry is commonplace, without inspiration, spontaneity, or charm of style. A few of his less ambitious pieces, such as *My Library*, *The Holly Tree*, and *The Battle of Blenheim*, keep a place in popular remembrance. Of his prose writings the lives of Nelson and Wesley are among the best, and indeed are among the best standard biographies in the language. His whimsical and mystifying book *The Doctor* is a favorite with many readers. The worth of Southey's character, his wide learning and incessant productivity, his dignified social standing, and his intimate association with Wordsworth and Coleridge, men of a higher genius than his own, still make him an important figure in English literary history. Revised by H. A. BEERS.

**South Framingham:** village; Framingham town, Middlesex co., Mass.; on the Boston and Albany and the N. Y., N. H. and Hart. railways; 21 miles W. by S. of Boston, and 23 miles E. of Worcester (for location, see map of Massachusetts, ref. 2-G). It contains 8 churches, a national bank with capital of \$100,000, 2 saving-banks, and 3 weekly newspapers, and is principally engaged in the manufacture of straw goods, woolens, shoes, paper, and rubber goods. Pop. (1890) not separately reported.

**Southgate, HORATIO, D. D.:** clergyman and author; b. at Portland, Me., July 5, 1812; graduated at Bowdoin College 1832, and at Andover Theological Seminary 1835; took orders in the Protestant Episcopal Church 1836; traveled as a missionary in the East; was chosen missionary bishop of Constantinople 1844; resigned his charge in 1850 and returned to the U. S. the following year, in which he became rector of St. Mark's, Portland, of the Church of the Advent, Boston, 1852, of Zion church, New York, 1859-72, and of St. Thomas church, Ravenswood, L. I., 1882. The episcopate of California was tendered to him by a convention of clergy and laity, but the plan miscarried. D. Apr. 11, 1894. He was the author of *A Tour through Armenia, Kurdistan, Persia, and Mesopotamia* (New York, 2 vols., 1840); *A Visit to the Syrian Church of Mesopotamia* (New York, 1844); *The War in the East* (1855); and *Parochial Sermons* (1859). Revised by W. S. PERRY.

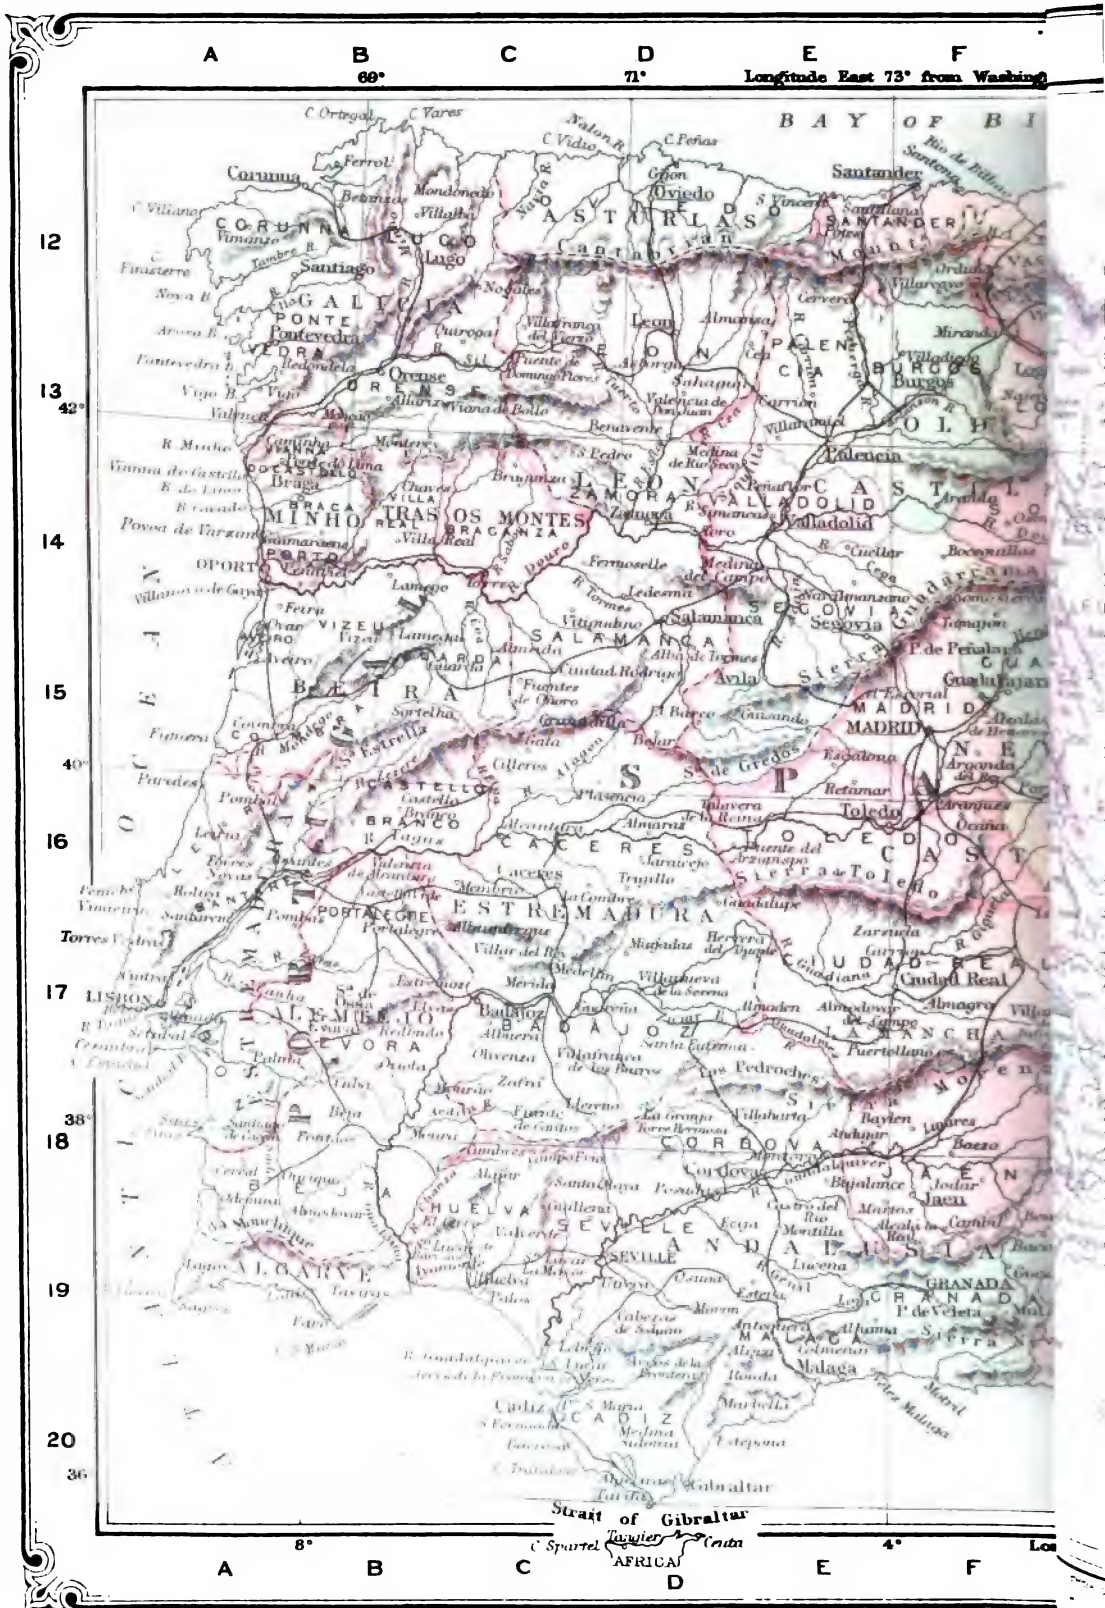

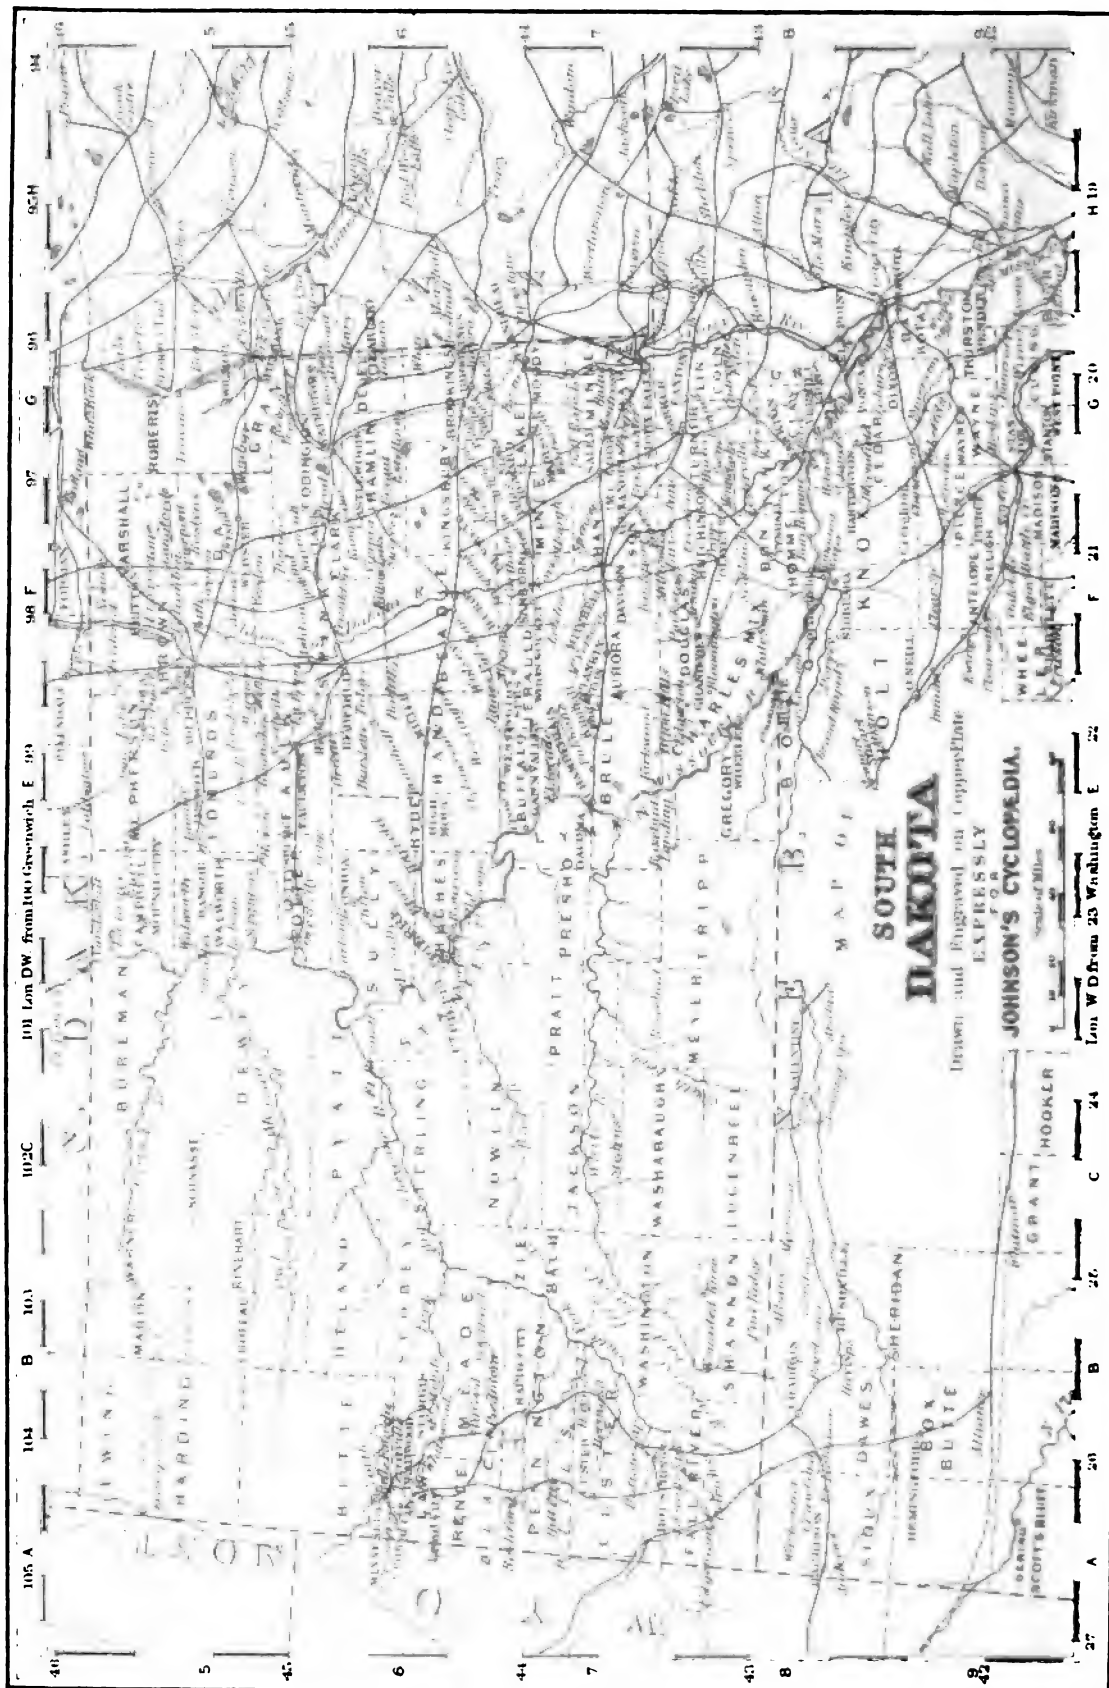

THE NEW YORK  
PUBLIC LIBRARY  
ASTOR, LENOX AND  
TILDEN FOUNDATIONS.

In 1889 4,854,742 persons were following agricultural pursuits, 823,310 the arts and trades, 409,549 domestic service, 243,867 industrial (textile and mineral), 194,755 commercial, 115,764 merchant marine, 97,257 public employees, 91,226 were inmates of asylums, etc., 84,510 professional, 72,077 religious, and 1,719,955 were school and college pupils. In 1892 the surplus of emigration over immigration was 8,258. Emigration is chiefly to Brazil, Uruguay, and Argentina.

The national church is the Roman Catholic, and the only professed dissenters in 1887 were 9,645 rationalists, 6,654 Protestants, 402 Jews, and 510 of other religions. In 1884 there were 32,435 priests, 1,684 monks resident in 161 monastic houses, and 14,592 nuns in 1,027 convents. There were 65 cathedrals, 18,564 churches, 30 religious colleges, and 11,202 other buildings used for religious purposes. Since 1876 private Protestant worship has been permitted.

In 1860 only 20 per cent. of the population could read and write; in 1889 this percentage had grown to 28.5. Compulsory primary education is statutory, but is not enforced. In 1885 there were 24,529 public free primary schools and 5,576 private ones, with a total enrollment of 1,843,183 pupils. The secondary schools are less efficient. There are 10 universities with 16,000 students in all; also various special schools supported by the Government.

**History.**—The colonization of the coasts of the Peninsula by the Phœnicians (Cadiz), Greeks (Saguntum), and Carthaginians (Cartagena) began about 1100 B. C. The Carthaginians extended their conquest over about a half of the Peninsula in the third century B. C. This was inherited by the Romans as the result of the Punic wars, and the conquest was completed 19 B. C. The Spanish provinces were very thoroughly Romanized. The Gothic invasion was begun in the fifth century of our era, but the Gothic kingdom was overthrown by the Arabs in 711, who remained in control of most of the Peninsula for three centuries. Christian kingdoms were gradually established from the eleventh century until the marriage of Ferdinand V. of Aragon and Isabella of Castile united these kingdoms in 1479, and began a career of prosperity, which resulted in the conquest of the Moors and the discovery of America, and gave Spain the form and character which it yet bears. The marriage of Isabella's daughter Johanna with Philip I., son of the Emperor Maximilian, made Spain a part of the Hapsburg empire, with Germany, the Netherlands, Milan, Naples and Sicily, Sardinia, Burgundy, and the colonies, under Charles I. of Spain, V. of Germany (1516). The despotism of Charles was followed by the tyranny of the bigoted Philip II. (1556-98), who, with the aid of the Inquisition, undertook to root out Protestantism, and he with his no less despotic and intolerant successors succeeded in bringing to a close before the eighteenth century the brilliant period of Spanish history, which began with Ferdinand and Isabella. The line of Hapsburg princes closed with Charles II. (1665-1700). On his death followed the war of the Spanish succession (see Succession Wars), which resulted in placing a Bourbon prince on the throne, and with two brief interruptions this dynasty has since remained in power. The first interruption was in 1808-14, during which time Joseph was kept in power by his brother Napoleon. This was the period of the Peninsular war, in which successful resistance to the self-aggrandizing schemes of Napoleon was for the first time offered. Upon the dethronement of their king and the occupation of his throne by Joseph Bonaparte the entire Spanish people rose in arms, and, though ill disciplined and unorganized, showed such vigor and courage as to require the personal presence of Napoleon in Spain in order to restore the French authority. Subsequently, however, he left to his marshals the difficult task of subduing the Spaniards, whose persistent efforts, aided and directed by the military genius of Wellington, resulted in driving out the intruders and contributed to the final overthrow of Napoleon. (For an account of the causes of the Peninsular war, see NAPOLEON I. (*Spanish Campaign*), and for further details WELLINGTON, ARTHUR WELLESLEY, DUKE OF.) The second interruption of the Bourbon rule was from 1868 to 1874, during which years a regency, a short-lived monarchy under Amadeus, and a republic were successively established. The Bourbons were restored Dec. 30, 1874, in the person of Alfonso XII., eldest son of Isabella. He died in 1885, and was succeeded by his posthumous son, Alfonso XIII., with Maria Christina, his mother, as regent. The Government has since passed alternately from a conservative to a progressive ministry, and back, with gradual progress toward greater freedom and more elaborate constitutional rights.

MARK W. HARRINGTON.

**Spal'ato, or Spalatro:** town and railway station; in the province of Dalmatia, Austria; on a peninsula jutting out into the Adriatic (see map of Austria-Hungary, ref. 10-F). It has a good harbor, is defended by a citadel, and carries on an active trade in grain, cattle, horses, swine, fruits, wine, and rosoglio, besides an extensive transit trade between Italy and Turkey. It is situated near the ancient *Salona*, on the site of the famous palace of Diocletian, called *Salonæ Palatium*, or, in an abbreviated form, *S. Palatium*; hence the name of the modern town. Of the magnificent palace, which covered 8 acres of ground and which it took twelve years to build, many remains are extant. Pop. (1890) 15,697.

Revised by M. W. HARRINGTON.

**Spalax:** a small rodent (*Spalax typhlus*) having the habits and very much the appearance of a mole. The incisors are large, the molars, three on each side of either jaw, have roots. The external ears are rudimentary, as are also the eyes, which are covered by the skin; the tail is rudimentary; the fore feet modified for digging. The silky fur is of a general yellowish brown; the length is 5 or 6 inches. The animal is also known as the mole-rat. It ranges from Southeastern Europe into Asia.

**Spalding, JOHN FRANKLIN, D. D.:** bishop; b. at Belgrade, Me., Aug. 25, 1828; graduated at the North Yarmouth Classical Academy, Maine, in 1849, at Bowdoin College, Maine, in 1853, and at the General Theological Seminary of the Protestant Episcopal Church, New York, in 1857; minister of St. James's church, Oldtown, Me., 1857-59; was rector of St. George's church, Lee, Mass., till 1860, when he became assistant minister of Grace church, Providence, R. I., for one year; rector of St. Paul's church, Erie, Pa., 1862-74; member of the general board of missions from 1865; dean of the Erie convocation Jan., 1866; member of the general convention 1868 and 1871; elected Oct. 24, 1873, by the House of Bishops missionary bishop of Colorado, with jurisdiction in Wyoming and New Mexico; consecrated bishop Dec. 31, 1873, and removed to Denver, Col., in Feb., 1874. He published *The Threefold Ministry* (1864), *Manual of Prayers* (1872), etc., and various articles, sermons, pamphlets, etc. Bishop Spalding has been for many years prominently connected with the movement to promote lay co-operation and women's work in the Church, deaconesses' institutions, and sisterhoods. He has also developed and placed on permanent foundations the educational work of the Church in Colorado, including, under the general charter of the College of St. John the Divine, Wolfe Hall for Girls, a school for boys, a theological training-school, etc.

Revised by W. S. PERRY.

**Spalding, MARTIN JOHN, D. D.:** bishop; b. in Marion co., Ky., May 23, 1810; graduated at St. Mary's College in 1826, and in 1830 went to Rome to enter the College of the Propaganda; returning to Kentucky, was ordained priest in 1834; appointed pastor of the cathedral church at Bardstow, and established *The Catholic Guardian*, with which he retained his connection until 1858; lectured in favor of Roman Catholicism in the U. S. and Canada, his lectures being published under the title *Evidences of Catholicity* (1847; 4th ed. 1866); in 1848 appointed coadjutor of the Roman Catholic diocese of Louisville; in 1850 became Bishop of Louisville, where he erected a cathedral. In 1864 he succeeded Dr. Kenrick as Archbishop of Baltimore; in 1866, as apostolic delegate, convened the second national council at Baltimore, and drew up the acts of the council. He took a prominent part in the Vatican Council of 1870-71, where he urged an immediate decision on the subject of papal infallibility, but wished it to be indirect and implied, rather than positive and affirmative; but he, with the other Roman Catholic bishops from America, yielded in favor of a positive declaration. His principal works are *Early Catholic Missions of Kentucky* (1844); *History of the Protestant Reformation in Germany and Switzerland*, written in opposition to Merle d'Aubigné (1860); and a translation, with notes and an introduction, of Darraz's *General History of the Catholic Church* (1866). His miscellaneous essays have also been published in book form. D. in Baltimore, Feb. 7, 1872.

**Spallanza'ni, LAZARO:** naturalist and physiologist; b. at Scandiano, duchy of Modena, Jan. 12, 1729; was ap-

period was Pedro de Peralta y Barnuevo (1670-1748), the Peruvian jurist, historian, and poet. His best-known work is the epic *Lima fundada*.

**Writers of the Nineteenth Century.—Poets.**—The nineteenth century has naturally produced more eminent writers than all previous ages. Foremost of these is Andrés Bello (b. Venezuela, 1781; d. Chile, 1865), revered in South America for his vast and varied learning and for his labors as jurist, educator, and poet, and conceded even by Spanish critics to be one of the greatest masters of Castilian that the nineteenth century has produced. His georgic *La agricultura en la zona tórrida* is especially admirable both for the beauty of its language and sentiment, and for its faithful descriptions of rural scenes and life in South America.

Spanish-American poetry and fiction, as might be expected, treat principally of three themes—the exploits of the early Spanish conquerors, the struggles of the colonies for independence, and the phases of life peculiar to a new country—which impart to the literature a unique and distinctive local coloring. Moreover, a number of poems and romances are founded on Indian legends, or tell of Indian life and customs, after the manner of Cooper and Longfellow. Two of the best of these are the *Paine* and *Reimú* of the Argentine publicist Estanislao S. Zeballos, who combines every form of literary activity. The earliest work of Juan León Mena (Ecuador, b. 1833) was an Indian epic which earned for him the title of Poet of the Indians. The *Huincahual* of the Chilean Alberto del Solar is one of the most powerful productions of this class. The dialect sketches of Estanislao del Campo, descriptive of the gauchos and life on the pampas, are especially quaint and entertaining. Nearly all the contemporaries of the struggles for independence were inspired by the patriotic deeds of America's heroes, but no one gave them more fitting expression than did the "American Pindar," José Joaquín Olmedo (Ecuador, d. 1857), a classicist of the purest type. His *Canto á Junín* is an epic ode without equal in the language. Some of the patriotic poems of Numa Pompilio Llona, of Peru, are especially fine; and the sonnet to Bolívar by the Peruvian Adolfo García is one of the most beautiful compositions of its kind. The best poetic productions based upon the days of the conquerors are *La grandeza de Méjico* of Bishop Valbuena (d. 1825); the beautiful epic *Gonzalo de Oyón*, by Julio Arboleda (Colombia, d. 1862); and Peralta's *Lima fundada* (already mentioned).

The Spanish language lends itself so readily to versification, especially when assonance is accepted instead of rhyme, that it may almost be assumed that every writer, not a scientific specialist, is also a poet. Juan León Mena published in 1868 a critical history of the poets of Ecuador, at a time when few were aware that that country had ever possessed any. Cuba has, of all Spanish-American countries, produced relatively the largest number of lyric poets. Gertrudis Gómez de Avellaneda, the greatest poetess of the language, was a native of Cuba; and persons of the lowest condition break forth in song. There the slave Juan Francisco Manzano (fl. 1830) won his freedom by his pen. Gabriel de la Concepción Valdés, another humble Negro, the author of *Siempre viva*, won laurels under the pseudonym of Plácido. Ramón Vélez Herrera's tragedy of *Napoleón en Berlín*, the *Pasionarias* of Rafael M. Mendive, and the *Margaritas* of the unfortunate Francisco J. Blanchié may also be mentioned. Some of the odes of the Cuban José María Heredia, in particular *Al Niágara*, *A la noche*, *Al sol*, and *Versos escritos en una tempestad*, compare well with the best of Coleridge and Bryant. Turning to the continent one finds vigorous descriptive work in *La cena de Baltasar*, by Manuel Carpio (Mexico, d. 1860). In *La salida del sol*, by his compatriot Ignacio M. Altamirano, is description of a more placid kind. Altamirano is also the author of one of the best recent novels, *Clemencia*. The poems of Arnaldo Márquez and Clemente Althaus, of Peru, take very high rank for their beauty and tenderness of sentiment as well as purity of style. The *Noche de dolor en las montañas* and the *Canto de la vida* of the Peruvian Numa Pompilio Llona are compositions which will be admired for centuries. The *Flores del aire* of Dr. Adán Quiroga, of Argentina, is a collection of poems of great merit and originality. Compositions of remarkable beauty will be found in the *Brisas del mar* of the Peruvian Manuel Nicolás Corpancho, the *Lágrimas y recuerdos* of Doña Silveria Espinosa de Rendón, of Colombia, and the *Flores silvestres* of Francisco Javier de Acha, of Uruguay. José Batrés y Montúfar, of Guatemala, a lyric poet of merit, is one of the most noted satirists of

America. Matías Córdoba and García Goyena, of Guatemala, have been justly compared as fabulists to Æsop and La Fontaine.

**Novelists and Dramatists.**—The novels most widely known are the *Amalia* of José Mármol (Argentina); the *Maria* of Jorge Isaacs (Colombia); *La linterna mágica* of José T. de Cuellar (Mexico); *Alberto el jugador*, by Doña Rosario Orrego de Uribe (Chile); the historical novel *El Padre Orant*, by Narciso Aréstegui (Peru); and the sparkling romance of the Colombian Julio Arboleda, entitled *Casimiro el montañés*. The Mexican historian Orozco y Berra wrote a beautiful novel, *Escenas de treinta años*, relating the experiences of an unfortunate, disappointed invalid. Among the most powerful recent novels are the *Libro extraño* of Dr. Francisco Sicardi, of Argentina, and *Umbral a la marea*, by the Chilean Alberto del Solar.

Among noted dramatists of the century have been, in Mexico, Rodríguez Galván, author of the first national drama, Fernando Calderón, and Manuel E. Gorostiza, author of *Independencia para todos* and *Contigo pan y cebollas*; in Peru, Manuel Nicolás Corpancho and Manuel A. Segura; in Uruguay, Francisco J. Acha.

Two fine specimens of prose word-painting deserve mention here, namely, the description of the Falls of Tequendama, by the Colombian botanist Fran. Antonio Zea (1770-1822), and Simón Bolívar's *Delirio sobre el Chimborazo*.

**Historians and Geographers.**—Spanish America has been especially prolific of historians and writers of descriptive geographical works. The names of some of the most famous of these, with their principal works, are as follows: Rafael María Baralt (d. 1860), *Resumen de la historia antigua y moderna de Venezuela*; Lucas Alamán (d. 1858), *Historia de Méjico*, 5 vols.; José Manuel Restrepo, *Historia de la revolución de Colombia* (1827); José Antonio de Plaza, *Historia de la Nueva Granada*; Joaquín Acosta (d. 1852), *Viajes á las regiones ecuatoriales*; Manuel Orozco y Berra (d. 1885), *Historia antigua y de la conquista de Méjico* (4 vols.); Antonio García Cubas, *Diccionario geográfico, histórico y biográfico de los E. E. U. U. Mexicanos* (5 vols.); Manuel José Cortés, *Ensayo sobre la historia de Bolivia* (1861); Antonio de Alcedo (Ecuador, d. 1812), *Diccionario geográfico histórico de las Indias occidentales* (5 vols.); Miguel Lobo, *Historia general de las antiguas colonias hispano-americanas*; Pío Benigno Mesa, *Anales del Cuzco*; Miguel Luis and Gregorio Victor Amunátegui, *Los precursores de la independencia de Chile* (1872); Diego Barrios Arana, *Historia de la independencia de Chile* (1870); Bartolomé Mitre, *Historia de Belgrano y de la independencia argentina* (3 vols.) and *Historia de San Martín y de la emancipación sud-americana* (4 vols.). Special mention should be given to Antonio Raimondi's great descriptive work, *El Perú*, which was cut short by the author's death in 1890, only four volumes and a part of the atlas having been published, and to the *Historia Argentina* of Mariano A. Pelliza, now in preparation, the fourth volume having been published in 1894.

**AUTHORITIES.**—*Lira Americana*, by R. Palma (Paris, 1865); *América Pética* and the *Diccionario Biográfico Americano*, by Domingo Cortés (Paris, 1875); Francisco Largomaggiore, *América Literaria* (Buenos Ayres, 1883); Francisco Pimentel, *Historia crítica de la literatura y de las ciencias en Méjico*; J. M. Torres Caicedo, *Ensayos biográficos y de crítica literaria sobre los principales publicistas y literatos de la América Latina*; Marcelino Menéndez y Pelayo, *Antología de poetas hispano-americanos* (3 vols. already published; Madrid, 1893-94); *Bocetos literarios de escritores argentinos*, by Martín García Merou (Buenos Ayres, 1892). García Merou's *Confidencias literarias* (1894), although treating principally of Argentine writers, devotes considerable space to the leading authors of other Spanish-American countries. **Spanish Fork:** city (founded in 1851); Utah co., Utah: on the Spanish Fork river, and the Rio Grande W. and the Union Pac. railways; 12 miles S. by E. of Provo (for location, see map of Utah, ref. 4-M). It is a trading-point for a large agricultural region, and contains Lutheran, Mormon, and Presbyterian churches, ten public and denominational schools, an incorporated bank with capital of \$25,000, and a weekly newspaper. The battle of Diamond Creek was fought here on June 20, 1866. Pop. (1880) 2,304; (1890) 2,214; (1895) 3,576. EDITOR OF "SEN."

songs was the *Cancionero General*, published in 1511. A later and more valuable collection, the *Romancero General*, was completed in 1614. Over 1,000 pieces have thus been rescued from oblivion. Many of them cluster around centers, partly historical, but largely imaginary. Twenty are devoted to Charlemagne and his peers, 50 gather around the name of Bernardo del Carpio, and 200 are songs of the Cid.

*Epic Poetry.*—The earliest Spanish epic is the *Poema del Cid*, which relates the adventures, real and imaginary, of the early hero Rodrigo (or Ruy) Díaz de Vivar. Although his death occurred as early as 1099, no portion of the poem is older than the twelfth century. It is without beginning, date, or name of author, and contains 8,744 assonant lines of fourteen syllables, more or less, arranged in quatrains. In its execution it is one of the finest productions of the Middle Ages. See CID.

It is at least 350 years from the supposed date of the *Poema del Cid* to the next great outburst of the epic Muse, in the reign of Philip II. In 1560 Sempere published the *Carolea*, to glorify the victories of Charles V. Five years later appeared the *Carlo Famoso*, wherein Luis de Zapata celebrates the achievements of the same monarch in 5,000 prosy octave stanzas. Alonso de Ercilla y Zúñiga, courtier, soldier, and poet (d. 1596), wrote an epic, one-third longer than the *Iliad*, on the suppression of the Araucan Indians of Chile, in which he bore an active part. Portions of the poem are of great beauty, and its merit elicited praise even from Voltaire. Gabriel Laso de la Vega published *La Mexicana* (1594) in honor of the conquest of Mexico by Cortés; and five years later Antonio de Saavedra issued a romantic life of the conqueror in his *Pelegrino Indiano*. About the same time Juan de Castellanos composed a rhyming chronicle of the conquests in South America in some 90,000 lines, a narrative that strongly attracted the attention of Humboldt and Southey; and Juan de la Cueva (1603) produced the *Bética*, on the recapture of Seville from the Moors, in imitation of Tasso's *Jerusalem Delivered*.

*Romances.*—Besides epics resting on Spanish history, there were others having either no basis of fact or only a very remote one. All Europe swarmed for many centuries with marvelous recitals that gave rise to the modern words *romance* and *romantic*. The Scriptures, the lives of the saints, Greek and Roman antiquity, the legends of Charlemagne and of King Arthur, afforded inexhaustible material that was handled with the utmost disregard of proprieties of time and place; and peerless knights, giants, necromancers, dragons, and fair ladies imprisoned in enchanted castles were furnished regardless of cost. The earliest Spanish romance was the *Alexandro* of Juan Lorenzo Segura, priest of Astorga, in the second half of the thirteenth century. By far the most important and popular work of this class was the *Amadis de Gaula* (see AMADIS OF GAUL), conjectured to have been written in Portuguese about 1360. It was followed by an extensive aftergrowth of romances and *caballeros* (books of chivalry and knight-errantry) that became ever more fantastic and insipid, until put down by the strong but gentle hand of Cervantes.

In the pastoral romances that supplanted them fancy was not at such a high tension. The earliest of these in Spain was the *Diana Enamorada* of Montemayor (d. 1561)—an imitation of the *Arcadia* of Sannazaro, the Neapolitan. Later appeared the *Fúrida* of Gálvez de Montalvo, the *Galatea* of Cervantes, and the *Arcadia* of Lope de Vega.

But romance was destined to seek a still lower level. Diego Hurtado de Mendoza (1503-75), a member of one of the noblest families of Spain, and almost equally distinguished as soldier, statesman, scholar, poet, historian, and writer of fiction, chose a strange subject for a romance. His hero, *Lazarillo de Tormes* (Little Lazarus, Luke xvi. 20), was an outcast from his birth, and the guide of a blind beggar. His genius and assiduity secure promotion, until he reaches the height of roguish ambition as a kind of king among thieves. This was followed in 1599 by Mateo Alemán's similar story of *Guzmán de Alfarache*; and in 1626 appeared the exploits of the *Gran Tacaño Pablo de Segovia*, into which the author, Quevedo, put some of his most brilliant work. This style of literature became and remained popular. It had a foundation in real life, however low, and was called "picaresque" from *picaro*, rogue. The *picaro* was an intelligent scoundrel, and had the genial humor of the South that made him almost lovable. Out of the three kinds of fiction named has been developed the modern novel.

*Rise of the Drama.*—While the remains of the Greek and Roman theater had become so debasing that the Church

exerted all its power to suppress them, the advantage was seen as early as the fifth century of presenting something to catch the eyes and attention of its less educated members. Representations of the stable, the temptation, Gethsemane, the judgment-hall, and Calvary were given by servants of the churches and school-children. Scriptural readings and choral hymns were added. Buffoons were gradually introduced, and the devil and his imps were given humiliating positions. In time the devils and the fools became the favorite characters, and the Church had unwittingly created a comic theater of its own. A feeble attempt to keep these exhibitions within bounds was made in the code of Alfonso X. (1260). Still they kept growing in number and complexity, until in the seventeenth century, in the hands of Calderón, they became great allegorical sermons. In the meantime the worst of them had been turned into the streets, where they continued to be presented to the multitude. In 1492 appeared *La Celestina*, a book which in the U. S. would be excluded from the mails. Its merit lay in presenting live men and women—even though at their worst—instead of the allegorical figures to which the public had been accustomed. It was never acted nor intended to be acted, yet it had an immense popularity and a powerful effect in developing the drama. More than thirty editions were made of the work, at least seven translations, and a swarm of imitations.

The next important step was made by Juan de la Encina, musician, poet, and priest, who (1496-98) brought out eleven pieces, which show little of the playwright in their construction, but were really acted; hence their author is recognized as the founder of the Spanish stage. Bartolomé de Torres Naharro (1517) composed eight comedies in easy verse, and gave a more regular form to the drama, dividing it into five acts (*jornadas*), and prescribing sound regulations for maintaining consistency and truth to nature. But he gave little heed to his own rules, introducing allegorical and impossible persons and incidents. About 1553 Francisco de Avendaño wrote several plays of three acts. Lope de Rueda (d. 1567), a gold-beater of Seville, who turned actor and dramatist, wrote sixteen plays, and first introduced interludes (*entremeses* and *pasos*) between the acts. Juan de la Cueva, a poet of Seville (1579), adapted the great historical romances to the stage, and introduced the division into four *jornadas*.\*

*Religious and Historical Works.*—As might be expected, there were from a very early period pieces in prose and verse intended for edification. The *Life of Saint Mary of Egypt*, the *Adoration of the Three Holy Kings*, and the *Danza General*, or Dance of Death, are so old as to be without known date or author. Then follow at irregular intervals *Miracles of the Virgin*, by Gonzalo de Berceo (1246); the *Caballería Celestial* of Hierónimo de San Pedro (1554); the *Monserate* of Virués (1581); the *Redención Universal*—30,000 lines—by Fran. Hern. Blasco (1584); and Diego de Hojeda's *Christiada* (1611). The excessive fondness for allegory, prevailing when these poems were written, makes them seem irrelevant to modern readers. In the *Caballería*, Christ and Lucifer, as Spanish knights, with their followers, maintain a war with varying success from Bethlehem to Calvary. The *Christiada* covers the period from the Last Supper to the crucifixion. The whole is connected and well sustained, but disfigured by the symbolism which was exuberant in the Middle Ages.

Alfonso X. of Castile (1252-84), surnamed *el Sabio*, the most enlightened prince of the age, has been called the father of Spanish prose, although his part must have been chiefly to foster and direct. To him are due a translation of the Scriptures, *Libros de Astronomía* (containing the famous Alfonsine Tables), a *Lapidario*, a *Crónica General* or Universal History, *La Crónica ó Historia de España* down to his own time, and a great compendium of law still known and respected as the *Siete Partidas*. Other chronicles were written by Fernán Pérez de Guzmán, Diego Enríquez and Alonso de Palencia, Ambrosio de Morales, and Gerónimo Zurita. Fernando del Pulgar and Andrés Bernaldés recorded the reign of Ferdinand and Isabella. But these old chronicles merely narrate a succession of occurrences without logical connection. The first real historical work is the *Historia de España* by the Jesuit Juan de Mariana (1601). In his time Spain produced a galaxy of eminent historians. Among the most prominent works may be mentioned the

\* All this time the exhibitions were given in gardens, courtyards, or the public streets, without scenery or costumes. The first theater for the reception of the public was opened in 1748.

Ayala (1828-70). Manuel Bretón de los Herreros (1796-1873) was foremost among writers of comedies. His numerous plays were ably devised, well written, and full of life and gaiety, and many of them are as popular to-day as when first presented. The great literary critics were Alberto Lista (1775-1848), Agustín Durán (1798-1862), Hartzenbusch, and Eugenio de Ochoa (1815-72). Cecilia Böhl de Faber (1796-1877), better known as Fernán Caballero, a woman of extraordinary capacity for seeing, grouping, and delineating real life, was the founder of the modern realistic novel. Gertrudis Gómez de Avellaneda (1816-73), whose writings exhibit every phase of woman's love and sorrow and religious feeling, is reckoned the most brilliant poetess in Spanish literature. Nearly all Spanish authors wrote more or less poetry; but of those who were essentially poets may be named Ventura de la Vega (1807-65) and Gaspar Núñez de Arce (b. 1834), dramatists and lyric poets, José Selgas (1824-82), poet of rural life and scenes, José Zorrilla (b. 1817), who sang of Spain's departed grandeur, and Ramón de Campoamor (b. 1817), the poet philosopher.

With the quiet and prosperity which the termination of the Carlist wars brought to Spain in 1876 came a period of enlightenment as great as that enjoyed by any other country of Europe. The spirit of progress is nowhere more evident than in the domain of letters. In every class of composition there are works of genuine talent, but the subjects in which contemporary Spanish literature chiefly excels are history, criticism, and fiction. Two political leaders, Emilio Castelar (b. 1832), the most eloquent speaker of the present day, and Antonio Cánovas del Castillo (b. 1830) are both eminent historians. Cánovas is moreover an able critic, as are also Juan Valera, the diplomat and novelist, and Emilia Pardo Bazán, the de Staël of modern Spain; but the most brilliant genius in the domain of literary criticism and history is Marcelino Menéndez y Pelayo (b. 1856), whose elegance of style and thoroughness of research have seldom been equaled. In Spain, as in the U. S., the novel is the principal feature of literature as distinguished from science. There too it has attained a high development, and is the chief agency in advancing the public sentiment. Spanish novels are second only to English; among the best-known are those of Pedro Antonio de Alarcón (1833-91), José María de Pereda (b. 1834), Juan Valera (b. 1827), Benito Pérez Galdós (b. 1845), Armando Palacio Valdés (b. 1831), and Doña Emilia Pardo Bazán (b. 1851), and the short stories of Antonio de Trueba (1819-89).

**AUTHORITIES.**—The American reader who is not a specialist will require nothing more before the nineteenth century than Ticknor's *History of Spanish Literature* (New York, 1849, 3 vols.; 4th ed. Boston, 1872, 3 vols.). Some additions have been made in the Spanish translation (Madrid, 1851-56) and the German (Leipzig, 1852-67). For the nineteenth century, Francisco Blanco García's *Literatura Española en el Siglo XIX* (2 vols., Madrid, 1891); *Literatura españolas del Siglo XIX*, of Juan P. Criado y Domínguez; and the *Historia de la Literatura Española* of Manuel de la Revilla and Pedro de Alcántara may be consulted.

MARATHON MONTROSE RAMSEY.

**Spanish Mackerel:** either of two scombroid fishes. (1) Along the eastern coast of North America, *Scomberomorus maculatus*, a very slender, compressed fish, bluish-green above, satin-like white below, with yellowish spots on the back and sides, and with the first dorsal fin blackish before and along its margin. It attains a length of 2½ feet. It is a native of the tropical seas, but ranges from Southern Brazil to Cape Cod, and is one of the most esteemed of salt-water fishes. (2) In Europe, *Scomber colias*, distinguished externally from the common mackerel (*Scomber scombrus*) by the larger eye and the diminished number of wavy streaks. It is known in the U. S. as the chub-mackerel and the thimble-eye.

**Spanish Main:** an old term still occasionally used for those portions of South and Central America which border on the Caribbean Sea, i. e. the modern Venezuela, Colombia, and the Central American states. The original Spanish term, *Tierra Firme*, included only the coasts from the mouth of the Orinoco to Costa Rica. Some writers erroneously use the name for the Caribbean Sea. H. H. S.

**Spanish War of Succession:** See SUCCESSION WARS.

**Span-worm, or Measuring-worm:** the larva of any geometrid moth; so called from the elevation of its body in locomotion, as if measuring. The CANKER-WORM (*q. v.*) is an example.

**Spar:** in mineralogy, a term used vaguely for several crystalline minerals of nonmetallic luster and smooth cleavage. See BARYTA, CALCAREOUS SPAR, FELDSPAR, and FLUOR-SPAR.

**Spar'idae** [Mod. Lat., named from *Spar'us*, the typical genus, from Gr. *σῆδος*, a kind of fish, the gilt-head]: a family of acanthopterygian fishes, comprising the porgy, sheepshead, and related forms. The body is compressed and oblong; the scales have obsoletely pectinated margins and striae diagonally crossing the surfaces and meeting the sides at acute angles; lateral line continuous to the caudal fin; head compressed; mouth terminal, with an oblique lateral cleft; upper jaw moderately protractile, and with the supramaxillaries partly sliding under the preorbital bones; teeth in the jaws either developed on the sides as molars, or in front as more or less defined incisors, or of both kinds; dorsal fin elongated, with its spinous portion rather longer than the soft, and folding in a dorsal groove; anal with three spines; caudal fin with pointed lobes; pectoral fin pointed and with the rays branched; ventrals thoracic, each with a spine and five branched rays, and with pointed axillary scales. The family is well represented in all warm and temperate seas. There is a considerable range of variation in dentition and squamation, as well as in osteological characters. No typical sparoids have yet been detected along the Pacific coast of the U. S. See SHEEPSHEAD.

**Spark, Electric:** See ELECTRIC DISCHARGE.

**Sparks, JARED, LL. D.:** historian; b. at Willington, Conn., May 10, 1789; graduated at Harvard 1815; was mathematical tutor there 1817-19, studying theology meanwhile; became pastor of a Unitarian church at Baltimore, Md., May, 1819; was chosen chaplain to the U. S. House of Representatives 1821; conducted at Baltimore a periodical, *The Unitarian Miscellany*, 1821-23; retired from the ministry on account of ill health, and removed to Boston 1823; purchased *The North American Review*, of which he was sole editor until 1830; visited Europe 1828; spent considerable time in examining the English and French archives for materials of American history; founded in 1830 *The American Almanac*; edited for the U. S. Government *The Diplomatic Correspondence of the American Revolution* (12 vols., 1829-30); published *The Writings of George Washington, with a Life of the Author* (12 vols., 1834-37); *The Life of Gouverneur Morris* (8 vols., 1832); conducted two series of a valuable *Library of American Biography* (1st series, 10 vols., 1834-38; 2d series, 15 vols., 1844-48), for which he wrote several of the lives; edited *The Works of Benjamin Franklin, with Notes and a Life of the Author* (10 vols., 1836-40), and *The Correspondence of the American Revolution* (4 vols., 1854); published two or three controversial pamphlets in defense of his editorial conduct in correcting Washington's orthography and grammar, and upon other similar topics, besides a number of works on religious subjects. Dr. Sparks was McLean Professor of History at Harvard 1839-49, and president of that institution 1849-53. D. at Cambridge, Mass., Mar. 14, 1866. See the *Memoir* by Rev. George E. Ellis, D. D. (Cambridge, 1869).

**Sparrow** [M. Eng. *sparwe* < O. Eng. *spearwa*; O. H. Germ. *sparo* (> Mod. Germ. *sperling*); Goth. *sparwa*]: any one of various birds of the family *Fringillidae*. The term is generally applied to those *Fringillidae* with a streaked plumage in which some shade of brown or chestnut predominates. The most familiar species is *Passer domesticus*, called in the U. S. English sparrow, from the country whence it was introduced, and more correctly known in Great Britain as the house-sparrow. It is too well known to need a description. Its original habitat was the greater part of Europe and temperate Asia and Northern Africa. The English sparrow was introduced into the U. S. in the fall of 1850, when Nicolas Pike and other directors of the Brooklyn Institute imported eight pairs. These did not thrive, but others were brought over in 1852 and at numerous subsequent dates, and by the end of 1886 the sparrow had spread over the greater portion of the U. S. E. of the Mississippi and N. of Florida, and extended in the northwestern portion of its range into Iowa and Minnesota and beyond the Missouri. It was also abundant about San Francisco, Salt Lake City, and New Orleans, while there were many scattered colonies beyond the frontiers of its domain. Since then it has steadily spread, but exactly how much territory it covers is not definitely known. The sparrow has also been introduced by thoughtless individuals

(for location, see map of Illinois, ref. 10-D). It is the center of a natural-gas region, and contains a woolen-mill, cannery, plow-factory, creameries, an incorporated bank with capital of \$25,000, a private bank, and a weekly newspaper. Pop. (1880) 1,754; (1890) 1,970.

**Sparta:** city; capital of Monroe co., Wis.; on the La Crosse river, and the Chi. and N. W. and the Chi., Mil. and St. P. railways; 25 miles N. by E. of La Crosse (for location, see map of Wisconsin, ref. 6-C). It is in an agricultural and fruit-growing region; is a popular summer resort; and contains medicinal artesian wells, free public library, high school, paper-mills, planing-mills, and flour-mills, carriage-factories, machine-shops, 2 State banks with combined capital of \$40,000, and 3 weekly newspapers. Pop. (1880) 2,387; (1890) 2,795. EDITOR OF "HERALD."

**Spartacus:** leader of the slaves in the Servile war (73-71 B. C.); b. in Thrace; was at first a shepherd and afterward chief of a gang of robbers, but was captured by the Romans, sold as a slave, and trained as a gladiator in a school at Capua. By showing how much better it would be to die in an attempt at freedom than to be butchered in the arena for a Roman holiday, he succeeded in forming a conspiracy among the pupils of the schools. Seventy of the conspirators, headed by Spartacus, fought their way out of Capua and took refuge in the crater of Vesuvius. Here they were soon joined by numbers of runaway slaves; an organization was accomplished; Spartacus was chosen leader, and formidable predatory expeditions were undertaken against the neighboring towns. C. Claudius Pulcher was then sent against them with an army of 3,000 men and blockaded them in the crater, but his force was suddenly attacked in the rear and almost annihilated. After this success the insignificant mutiny of a few slaves rapidly grew into a formidable war. The peculiar state of affairs in Southern Italy contributed much to this result. The soil of that region was almost exclusively owned or leased in large allotments by the Roman nobles, whose estates were cultivated by a numerous slave population, which lived in the most abject condition. Spartacus proclaimed the abolition of slavery, and before long he was at the head of an army of 70,000 men. His plan was to force the passes of the Alps, lead his army out of Italy, and then send every man to his home. With a victorious army of about 100,000 men he passed by Rome, and penetrated into the regions of the Po, where he was met by two consular armies. He defeated and routed them both, and at the funeral games which he celebrated in honor of Crixus he compelled the Roman knights among his prisoners to fight as gladiators in the arena. Unable to induce his soldiers to follow him out of Italy, he marched S. and went into winter quarters in Thurii. The defection of some of his troops and dissensions in his camp led to his defeat by Crassus. He then tried to cross over to Sicily, but was betrayed by the Cilician pirates who had agreed to transport his forces. A part of his army fell into the hands of Crassus, but Spartacus and the remainder of his troops effected their escape. Lucullus was now recalled from the East, Pompey from the West. After new victories, Spartacus went to Brundisium with the purpose of seizing the shipping in the harbor and crossing over to Thrace. Falling in with the army of Crassus, near the source of the river Silarus, he was defeated and slain. The fugitives were hunted down and slaughtered, and the revolt was completely suppressed. Revised by F. M. COLBY.

**Spartanburg:** city; capital of Spartanburg co., S. C.; on the Port Royal and W. Car. and the Southern railways; 73 miles W. S. W. of Charlotte, N. C., 93 miles N. W. of Columbia, the State capital (for location, see map of South Carolina, ref. 4-C). It is in a gold and iron mining and limestone-quarrying region; is the seat of Wofford College (Methodist Episcopal, established in 1853); and contains a high school, a national bank with capital of \$100,000, 2 State banks with combined capital of \$150,000, and a daily, a semi-weekly, and 3 weekly newspapers. Pop. (1880) 3,253; (1890) 5,544.

**Spartianus Aelius:** See AUGUSTAN HISTORY.

**Spasm** [from Gr. *σπασμός*, *σπάσμα*, spasm, derivs. of *σπᾶν*, draw, draw apart, pull, rend]: sudden and involuntary muscular contraction. The relaxation and tension of muscular tissue are dependent on nerve-force. Spasm of muscle may result from disturbance of the nerve-centers, from peripheral irritation of the affected part, or from irritation of other organs or surfaces reflected from the nerve-centers.

When spasmodic rigidity is persistent for any length of time it is termed *tonic* spasm. Such is the period of rigidity at the beginning of the epileptic attack and the prolonged rigidity of tetanus and cerebro-spinal meningitis. When spasm is brief and recurs rapidly, it is termed *clonic* spasm. Such are the intermitting and repeated muscular contractions following the inception of the true epileptic attack, and constituting the more ordinary epileptiform attacks or "fits" of children. The graver spasmodic diseases are true epilepsy; epileptiform attacks from many causes, as indigestion and worms in children, renal disease in adults, and in the course of severe acute diseases, narcotic poisoning, etc.; chorea or St. Vitus's dance; tetanus; hydrophobia. Many lesser and local states of spasm frequently occur. Sneezing and coughing are spasmodic contractions of the respiratory tracts excited by irritation of the nasal or bronchial mucous membrane. Asthma is spasmodic constriction of many bronchial tubes, producing dyspnoea. Whooping-cough unites extreme hyperæsthesia and spasm of the bronchi with spasmodic constriction of the larynx. Intestinal colic and cholera morbus are conditions of painful spasmodic constriction of the intestines, due to cold or bad diet. In invalids and persons of sensitive nervous system painful spasms of various internal and external parts may develop suddenly from unknown or trivial exciting causes. The immediate relief of spasm is secured by so-called anti-spasmodics or nervines, as valerian, musk, camphor; by anæsthetics, narcotics, and sedatives, as potassium bromide, hyoscyamus, belladonna, opium. The permanent cure, when attainable, follows the correction of known causes. Revised by W. PEPPER.

**Spatan'gide:** See ECHINOIDEA.

**Spathe** [from Lat. *spatha* = Gr. *σπάθη*, any broad flat blade, spatula, stem of a palm-leaf, broadsword, whence (viâ Lat. and O. Eng.) Eng. *spade*]: the single sheathing bract which incloses a cluster of one or more flowers in many species of monocotyledonous plants. Sometimes the inclosed flowers are arranged on a spike of the form called *spadix* (*σπάδιξ*), and in numerous palms the spadix is branching, and besides the principal spathe there are numerous secondary ones on the spadix. Revised by C. E. BESSEY.

**Spaulding, LEVI:** missionary; b. at Jaffrey, N. H., Aug. 22, 1791; graduated at Dartmouth College 1815 and at Andover 1818; went to Jaffna, Ceylon, as a missionary of the American Board; remained on that island fifty-three years, during which time he made but one visit to the U. S. (1844); superintended a boarding-school for girls at Udville; prepared tracts, hymns, and school-books in the Tamil language, into which he translated several religious works; prepared (with Rev. J. Knight) a *Tamil Dictionary* (Madras, 1844), and issued a revised translation of the Bible. D. in Ceylon, June 18, 1873.

**Spaulding, SOLOMON:** clergyman; b. at Ashford, Conn., in 1761; was a soldier in the war of the Revolution; graduated at Dartmouth College 1785; became a Congregational minister in Connecticut 1787; settled in Ohio some years later, and while residing at Salem in that State about 1812 wrote a novel entitled *The Manuscript Found*, suggested by the opening of an Indian mound. It is claimed that this fiction became known to Sidney Rigdon at Pittsburg in 1814, and that it was the origin of the *Book of Mormon*. D. at Amity, Pa., Oct. 20, 1816.

**Spa'vin** [M. Eng. *spareyne*, from O. Fr. *esparvain* > Fr. *éparvin*, spavin]: certain swellings upon the hock-joint of the horse. In bog spavin the swellings and lameness are due to undue secretion of synovia (the lubricating fluid of joints). The most successful treatment is entire rest, with frequent bathing of the parts with cold water, and bandaging, accompanied by firm pressure upon the swelling, secured by means of compresses or spring trusses. Bone spavin, or spavin proper, is bony enlargement (exostosis) of the hock-joint, usually beginning at the lower part of the joint on the inside, and involving the heads of the splint and cannon bones, and of the small bones with which they articulate. It causes lameness, observable even in the early stages, and an imperfect action of the joint, gradually growing worse until finally the various bones become to a great extent united and solidified by the mass of fibrous bone which grows over them. The disease is caused by strains, to which the hock is particularly subject in work-horses drawing heavy loads, especially when starting them, and in race-horses and saddle-horses accustomed

**Specific Inductive Capacity:** See *INDUCTIVE CAPACITY*.

**Specific Performance:** in the equitable jurisprudence of the U. S. and of England, the species of remedy conferred by courts of equity, in which a party is compelled to perform the very thing which he has undertaken to perform in behalf of the person to whom the undertaking is given. In its broadest sense, the phrase would properly describe all the varieties of equitable relief which consist in procuring a defendant upon whom an obligation rests to do the very specific acts which such obligation requires him to do; but in its technical and more restricted signification it is confined to cases in which the obligation arises out of a contract entered into by the defendant. The common law knows but one form of remedy for the breach of any and all contracts—a recovery of money either as debt or damages. Whatever be the nature of the agreement, whatever be its subject-matter, whatever acts or omissions it calls for, a pecuniary compensation for its non-performance is the only judgment that can ever be obtained against the defaulting party by means of the common-law courts. It is very plain that in the innumerable variety of relations incident to modern society contracts will necessarily be made for whose breach this mere pecuniary payment would be an utterly inadequate and often impracticable relief; and a system of municipal law which provided no other kind would fail in maintaining and dispensing the justice which is the final object of all enlightened jurisprudence. To supply this defect in the common-law methods the courts of equity began long since to decree the specific performance of contracts in certain cases; and the general principles which determine the classes of agreements to which this remedy may be applied are now ascertained and well settled, and constitute a distinct department of equity. The doctrine as thus established is shown in the simplest and clearest manner by enumerating the instances in which a specific performance will not be decreed, and which are therefore left within the exclusive jurisdiction of the common-law tribunals and to the application of the common-law remedies:

1. The fundamental and most important rule is, that a specific performance will not be ordered when the complaining party can obtain adequate relief by means of a purely legal judgment. If, therefore, the contract vests the plaintiff with property in a chattel, so that he can recover its possession through an action at law, or if by the money recovered he can restore himself to the same position, in contemplation of law, which he would have occupied if the defendant had fulfilled his agreement, he will be left to his legal remedy alone, and courts of equity will not interfere in his behalf. As an illustration: If the contract relates to ordinary goods and chattels, or to any kind of personal property having a marketable value, and contemplates a delivery thereof in any manner or a transfer of title, since a sufficient sum of money paid to the injured party will always enable him to purchase or procure other articles of a like nature, amount, and value to those stipulated for such a pecuniary compensation is deemed an adequate remedy, and a specific performance will be refused. The example here given, and the fundamental rule which it illustrates, have a very wide application, and they remove at one blow all ordinary agreements concerning personal property, especially those which are mercantile in their character, from the operation of this equitable mode of enforcement. The mere fact, however, that an agreement deals with or relates to personal property does not necessarily withdraw it from the jurisdiction of a court of equity. The subject-matter may be a chattel of some peculiar, intrinsic, but not marketable value, which can not be elsewhere purchased or reproduced, so that the pecuniary damages will not compensate for its loss; and in such cases, although they are exceedingly rare, the specific relief may be obtained. A certain class of covenants, also, wherein the parties promise to execute some further and more formal agreements—as, for example, to execute a marriage or family settlement on wife and children—may be specifically enforced by compelling an execution of the contemplated instrument, although it relates to personal property and not to real estate. These instances, however, are comparatively few, and in the vast majority of contracts concerning personal property or personal services the money-recovery granted by the law

courts is regarded as an adequate relief, and the extraordinary remedy administered by the equity tribunals is denied. In all the subsequent rules it is of course assumed that the agreement, if judged by the principle alone which has already been stated, is one to which the equitable method of enforcement might be applied.

2. In order that a specific performance may be decreed, such a performance must be reasonably possible by the contracting party. If, therefore, by the original terms of the contract he did not have the power to fulfill, or if from circumstances occurring after its execution the power has been lost, even through his own voluntary act, a court of equity will not go through the empty form of ordering an impossibility to be accomplished, and the plaintiff must be contented with an award of pecuniary damages, which perhaps may be enhanced by reason of the defendant's conduct. For example, if the owner of a farm should, by a valid agreement of sale, bind himself to convey it to the purchaser on a future day named, but before that time had arrived should actually convey it to another *bona-fide* grantee, a specific performance of the contract would not be decreed at the suit of the original vendee, because a transfer of the title to him by the vendor would then be impossible, and he would be left to his action for damages. Specific performance can be obtained, however, against a person who buys with notice of a prior contract for the sale of land, or who acquires title to the property without paying value. As a corollary of this rule, it is requisite that the terms of the contract should be plain and unambiguous that there can be no reasonable doubt as to the intention of the parties, and that this design may be directly carried into effect by the judgment.

3. Not only must the performance be possible by the party upon whom the obligation rests, but the subject-matter of the agreement, and its stipulations in regard thereto, must be of such a nature that the court, by means of its ordinary administrative instruments and machinery, can compel the specific performance which it decrees. Cases may arise, and are not infrequent, in which the court, after directing a performance according to the provisions of the contract, would have no power to enforce its decision directly without departing from its customary functions or incurring an amount of trouble, care, and responsibility incompatible with the discharge of its regular duties; a specific performance will then be refused, however inadequate might be a mere recovery of damages. Under the operation of this principle the agreement of an actor, a singer, a painter, or other artist to employ his talents in a specified manner can not be specifically enforced; and the rule applies in general to all stipulations for personal services, notwithstanding the fact that these services may be of such exceptional value that they can not be procured from any other person but the defendant. For the same reason it has been decided that the specific performance of a contract to construct a railway will not be decreed, since such an undertaking is too extensive and burdensome to be carried on under the direction of a court of equity. See, however, *Wilson vs. Furness Railway Co.*, L. R. 9 Eq. 28; *Laurence vs. Saratoga R. R. Co.*, 36 Hun. 467.

4. Finally, the agreement and the relations of the parties must be such that a decree of specific performance will be reasonable, just, and equitable. It is sometimes said that this remedy is never a claim of right, but is always a matter of discretion. The doctrine as thus stated simply means that in determining whether the relief shall be granted in a given case certain equitable considerations are to be taken into account, and not the mere fact that the agreement is valid in law. The beneficent principle is applied that he who seeks equity must do equity. If, therefore, the contract was procured by overreaching or artifice, although not tainted with fraud as to be invalid, if it is unfair or oppressive in its terms, if the consideration is grossly inadequate, if its specific enforcement would be unreasonably burdensome to the defendant without any corresponding benefit to the plaintiff, if the plaintiff has been guilty of unnecessary delay in prosecuting the action whereby his opponent has been prejudiced—in these and in similar cases showing a want of good faith or diligence on one side or serious injury on the other, the equitable considerations become controlling, and lead to a denial of the specific remedy.

As the practical result of these rules, the usual contracts enforceable by a decree for a specific performance are those directly relating to land as their subject-matter. It is a settled doctrine of the equity courts that money-damages are not an adequate relief for the breach of such agreements.

glass, calcite, and other media. If the paths are essentially different in these particulars, selective absorption and reflection and other disturbing causes may introduce errors into the final comparison.

Various sources of light, such as the sun, the incandescent filament of the glow-lamp, and a standard gas-flame, have been used as standards in work with this instrument.

W. F. DURAND.

**Spectroscope** [Mod. Lat. *spec'trum* + Gr. *σκοπεῖν*, view]: any instrument for the production and study of spectra. Spectroscopes designed for the precise determination of wave-length are called spectrometers. Spectroscopes may be classified with reference to the nature of the dispersing device, whether prism or grating; or with reference to the dispersing power (high or low); or according to the special purpose to which the instrument is to be put (telespectroscope, microspectroscope, etc.).

Whatever the type of spectroscope, its action is always based upon the principles stated in the article SPECTRUM (q. v.). The essential parts are the slit and the dispersing device, to which may be added the focusing arrangement, and the means of identifying and determining the positions of the various regions of the spectrum under investigation. The slit possesses the same features in nearly all forms of spectroscope. It consists of two parallel jaws of metal, very accurately worked and adjusted. One or both have freedom of motion in a direction at right angles to the length of the slit. Fig. 1 shows one of the best-known methods of produc-

Fig. 1.

ing these motions. The device is due to Hilger. The two edges should be so true in workmanship that when brought within a small fraction of a millimeter of one another the aperture will still be approximately of uniform width throughout. This aperture when illuminated from behind forms the source of light the image of which, dispersed and focused upon a screen, or within the eyepiece of an observing telescope, is to form the spectrum.

**Dispersing Devices.**—(1) *The Prism.*—The usual material is glass, although for special purposes rock-salt, quartz, fluor-spar, carbon bisulphide, etc., are used. Rock-salt possesses the advantage of extreme transparency for the longer waves of the infra-red to which glass is opaque; quartz has the equally desirable property of transparency in the ultra-violet. Fluor-spar is unique in having a law of dispersion which gives great separation to the longer waves, thus permitting the extension of measurements to regions unattainable with prisms of other materials. This property combined with very complete transparency in the same regions makes fluor-spar one of the most valuable of substances to the student of radiation. Carbon bisulphide is used where a dispersing medium is desired, the law of dispersion of which is known. Cauchy's formula,

$$N_{\lambda} = a + \frac{\beta}{\lambda^2} + \frac{\gamma}{\lambda^4},$$

where  $N_{\lambda}$  is the index of refraction for a wave-length,  $\lambda$ , and  $a$ ,  $\beta$  and  $\gamma$  are constants, when applied to nearly all substances available in spectroscopy, gives false values for the infra-red. Carbon bisulphide appears to obey the above law for all wave-lengths.

In glass an important quality is high dispersing power, and this is a property which the variety known as flint glass possesses in a high degree. How great is the difference between different sorts of glass will appear from Fig. 2, which shows the spectra produced by similar prisms of crown and of flint glass under like conditions. It will be seen that the distance between the Fraunhofer lines A and H, or, in other words, between the extreme red and the extreme violet, is nearly twice as great in the one case as in the other. Flint glass has one very serious disadvantage for spectroscopic work, viz., that

Fig. 2.

as its dispersive power increases, its transparency, particularly for the shorter wave-lengths, diminishes. Even ordinary optical glasses are far from completely transparent, and the densest varieties are nearly opaque to the extreme violet of the spectrum. In spectroscopes with a single prism the latter is usually equiangular. Where a train of prisms is used to secure high dispersion, lesser angles are frequently employed.

**Trains of Prisms and Direct Vision Combinations.**—Whenever high dispersion is desired and a prismatic spectrum is preferred to the normal spectrum produced by means of the diffraction grating, a train of prisms is employed. Kirchhoff and Bunsen used for this purpose simply a set of independent equiangular prisms, each mounted upon three pins. These were set up upon a metal plate, and were adjusted separately by hand until the entire train was symmetrically arranged. As the positions for minimum deviation differed with the wave-length, this laborious operation had to be continually repeated. Later workers with the spectroscope devised automatic trains, such that the movement of the eye-telescope shifted all the prisms simultaneously into their proper positions. Fig. 3 shows the automatic arrangement due to Rutherford. In the astronomical spectroscope depicted in Fig. 11 a similar train is used.

To avoid the inconvenience of having the collimator and observing telescopes make an angle with one another, as in Figs. 8, 12, and 13, combinations of flint and crown glass prisms are sometimes used in spectroscopes of small dispersion to produce a spectrum without any considerable deviation of the rays from direction of their original path. Fig. 4 shows the usual arrangement, in which  $c c c$  are crown-glass and  $f f$  are flint prisms. It is an extension by Jansen of the original idea of Amici, who used three prisms, two crown prisms with one flint prism between them. The action of both the three and five prism systems depends upon the difference in the dispersing powers of crown and of flint glass.

It is evident that if the system is so constructed that a certain ray of wave-length,  $\lambda$ , so selected as to lie near the center of the spectrum, emerges with its path parallel to the incident path (as in Fig. 4), rays of other wave-lengths will suffer more or less divergence from that direction. There is a resultant dispersion by such a system, although the mean direction is unchanged.

There are a variety of other methods for rectifying the direction of the dispersed rays in the spectroscope, some involving subsequent reflection by means of a mirror (Fig. 5), others total reflection either within the dispersing prism (Fig. 6; itself a construction ascribed to Herschel) or by means of a separate rectangular prism properly placed for that purpose (Fig. 7). None of these devices, however, has come into very general use.

(2) *Gratings* for the production of diffraction-spectra are frequently used in the spectroscope instead of prisms as dispersing apparatus. It is used in spectroscopic work (1) whenever a normal spectrum rather than a prismatic spectrum is desired—that is to say, when direct absolute determinations of wave-length are to be made; (2) when high dispersion is wanted. Gratings give relatively greater openness in the longer wave-lengths and less in the violet and ultra-violet than do

Fig. 3.

Fig. 4.

Fig. 5.

Fig. 6.

Fig. 7.

prisms. They are objectionable in some kinds of work on account of the faintness of the spectra produced, of the overlapping of the spectra, and of the fortuitous and altogether irregular distribution of intensities. For photographic work, however, gratings are especially advantageous because the strong absorption which violet light suffers in passing through flint glass (as indicated in a previous paragraph) may be avoided.

**Collimator and Observing Telescope.**—Spectroscopes of the usual form (Fig. 8) have between the prism or grating and the slit a lens (C), the purpose of which is to bring light to the prism in parallel rays. This lens is attached by means of the connecting tube to the slit at such a distance that the latter is at the principal focus. This arrangement is called the collimator. Beyond the prism the dispersed rays enter the observing telescope (T), which

FIG. 8.

having been focused for parallel light brings the portion of the spectrum under observation to a focus in the eyepiece. Collimator-tube and telescope swing upon a common vertical axis at the center of the instrument. By means of the position of the telescope, as indicated upon a divided circle (a), about which it moves, the region of the spectrum which is in coincidence with the cross-hairs in the eyepiece is identified.

FIG. 9.

Where a grating is used the position of the parts of the spectroscope is that shown in Fig. 9, the telescope being placed on either side of the collimator according as the right-handed or left-handed spectra are to be observed, and at various angles according to the order of the spectrum.

Formerly a train of prisms was used, as in the spectrometer of Kirchhoff and Bunsen (Fig. 10). The automatic train depicted in Fig. 3 was a later form. It found one of its most important applications in the telescope-spectroscope, a well-known form of which is shown in Fig. 11. This instrument, which could be adjusted so as to give any dispersion up to that corresponding to twelve prisms, is constructed in compact form and attached as an eyepiece of a large telescope.

FIG. 10.

**Chemical Spectroscopes.**—For many purposes the exact but laborious method of determining the position of lines in the spectrum by making readings upon a finely divided circle may be advantageously supplanted by a less precise but more expeditious process. This is true, for example, in the identification of sub-

FIG. 11.

stances by means of their bright-line spectra or in the study of absorption spectra. The first instrument especially de-

signed for such work was the chemical spectroscope of Bunsen (Fig. 12). The circle in this apparatus is dispensed with and both collimator and telescope are fixed. The dispersion is so small as to bring the entire spectrum into the field of view. A third tube, S, carries a transparent scale (photographed upon glass). In Fig. 13 the letter a shows the position of this scale. There is a lens at b by means of which the image of the scale is brought to focus in the eyepiece of the telescope. The rays are reflected from the face of the prism, as shown in the figure. The scale is illuminated from behind by means of a flame, L<sub>1</sub>. The appearance of the field of view when a spectrum consisting of bright lines is under observation is shown in Fig. 14.

FIG. 12.

At the hands of Hofmann and of Krüss and others, the chemical spectroscope has undergone many improvements, among which may be mentioned the introduction of direct-vision prisms and of a scale reading directly in wave-lengths. Fig. 15 shows such an instrument, with diagram of its parts. In the microspectroscope also, or spectroscopic eyepiece, direct-vision prisms are used and the direct-reading scale. This instrument indeed is simply a direct-vision spectroscope of small proportions and adapted to the eyepiece of the compound microscope. In Fig. 16 the cross-section of a microspectroscope is shown, with prism (p) for introduction of a reference spectrum and a scale (s).

FIG. 13.

FIG. 14.

**Spectroscopes for the Infra-red and the Ultra-violet.**—For the study of the invisible spectrum spectroscopes of the usual forms are ill adapted. Various special types have accordingly been developed.

*In the infra-red* the conditions are transparency to the longer waves and sufficient dispersion of that part of the spectrum. Rubens uses in such work an instrument with a prism of fluor-spar. Lenses are dispensed with altogether in favor of concave mirrors, which bring the spectral image to a focus upon the filament of a linear bolometer.

*In the ultra-violet*, where the method is photographic, the best results are obtained by the use of the concave grating of Rowland.

Brashear, in his grating spectroscope for the ultra-violet, mounts grating (G) and plate-holder (P) at the ends of a rigid bar (B, Fig. 17). The grating is placed upon a car with two wheels, which runs along

FIG. 15.

a metal track,  $S R_1$ . This track extends from the slit in the incident ray. Another track ( $S R_2$ ) at right angles to the

Fig. 16.

Fig. 17.

first carries a plate-holder. The bases upon which grating and plate-holder are mounted are pivoted to the cars on which they are placed, so that the bar can be brought to any angle with the incident ray, both grating and plate-holder remaining

Fig. 18.

always normal to the direction of the bar and at the same distance apart. The law of the grating is such that if the distance between the grating and plate is equal to the radius of the curvature of the former the spectrum will be in focus upon the plate in all positions of the bar. The light to be investigated is focused upon the slit by means of a quartz lens or sometimes by a concave mirror of long focus. Fig. 18 shows the general form of the apparatus.

A description of some of the varied applications of the spectroscope is given in the article SPECTRUM (q. v.); see also SPECTROPHOTOMETER; also the various treatises named at the end of the former article.

E. L. NICHOLS.

**Spectrum** [= Mod. Lat., from Lat. *spectrum*, appearance, image, apparition, deriv. of *specere*, look at]: in optics, the image obtained when a ray after dispersion, either by passage through a prism or by diffraction, is brought to a focus. The composite nature of light, through which a spectrum is possible, is explained in the article LIGHT.

The first systematic studies of the spectrum were made by Newton, 1666, and it was he who appears to have first recognized the supreme importance of the phenomena encountered in such observations. Modern spectroscopy, however, may be regarded as having its beginning in the experiments of Fraunhofer, who in 1817, by the use of a narrow slit, first produced well-defined and pure spectra.

The essential parts of the apparatus for the production of such a spectrum are (1) a slit illuminated from behind; (2) a dispersing device (usually a prism or a diffraction grating); (3) a focusing device (a lens or system of lenses, or sometimes a mirror); (4) a screen or an observing telescope, according to the method to be pursued in studying the spectrum.

In Fig. 1 is shown a slit through which light of a wave-length,  $\lambda$ , passes in the direction indicated by the arrow.

Fig. 1.

But for the interposition of the prism P, the lens L would produce an image of the slit  $S_1$  at the conjugate focus  $S_2$ . The prism, however, diverts the ray, and it comes to focus upon the screen  $i, u$ . The position of this refracted image depends upon the wave-length. If, for example, the wave-length is one which produces the impression of red upon the retina it will come to focus at  $r$ ; if of violet, at  $v$ . If the ray passing through the slit be of white light, the entire space between  $r$  and  $v$ , which we may suppose to be respectively the longest and the shortest rays capable of affecting

the eye, will be filled by colored images of the slit, each differing insensibly from its neighbors in hue. This infinite series of elementary images constitutes what is called a continuous spectrum. Each image has a width proportional to that of the slit, but the centers of contiguous members of the series are only infinitesimally distant from one another. Neighboring images overlap, therefore, with consequent color-mixing.

A pure spectrum, in the language of the spectroscopist, is one in which the effect of this color-mixing by fusion of the overlapping images is absent. In a strict geometrical sense a pure spectrum would be produced only by the use of a linear slit. The successive elementary images differ from one another, however, only infinitesimally in color, and a definite finite difference must exist before the effect of the blended images upon the retina will differ from that of their components. In practice the spectra produced by the dispersion of the light from any narrow slit (up to perhaps .05 cm. for an ordinary spectroscope) may be regarded as pure. The distribution of wave-lengths, and consequently of colors, in the prismatic spectrum is determined by what is called the law of dispersion of the prism. It has not been found possible to give a general expression to this law, applicable to all substances. The phenomenon of dispersion differs indeed in various transparent media, such as calcite, fluorite, rock-salt, quartz, etc., in ways the explanation of which has not yet been attained. In glass, which is an artificial mixture with varying components, the dispersion is to a considerable extent under the control of the maker.

For any particular case the dispersion can be indicated graphically in a simple manner. An important example is that of an equiangular prism of flint glass, the dispersion diagram of which appears in Fig. 2. The ordinates of the

Fig. 2.

curve are wave-lengths in millionths of a meter; the abscissae are distances in passing through the spectrum from violet to red. The vertical lines at the base of the diagram show by their distances apart the relative spaces which exist between wave-lengths 0.40μ, 0.50μ, etc.

While this diagram applies only to a particular specimen of glass, it is characteristic to a certain extent of nearly all cases of prismatic dispersion, the peculiarity of which is the increasing separation of the rays as the wave-length diminishes, so that the red end of the spectrum is relatively much more crowded together than the violet end.

The diffraction spectrum (normal spectrum) is produced by means of apparatus, of which that shown in Fig. 3 is typical. The diagram gives only the essential parts, which are the same as those in Fig. 1, with the exception that a reflecting diffraction grating (G) is used instead of a prism. This grating, according to modern practice, would consist of a plate of speculum metal, the surface of which is acco-

ately ground to form a plane mirror, or sometimes a concave mirror with a radius of several feet. Upon this surface are ruled straight equidistant lines to the number of several thousand per centimeter. The process is that described in

FIG. 3.

the article **RULING-MACHINES** (q. v.). If monochromatic light from the slit falls upon this ruled surface, it is sent back by reflection from the lines in all directions, in a plane perpendicular to the ruling and to the face of the mirror, and diffraction-bands are formed. These are alternately black and of the color of the light. The law of the position of the colored bands, which are distributed symmetrically with reference to a plane normal to the grating, parallel to the ruling and passing through the slit, is given by the equation

$$\sin \alpha_n = \frac{n\lambda}{a+b}.$$

In this formula  $\alpha_n$  is the angle that the rays which go to form the  $n$ th band of the series make with the incident ray from the slit,  $\lambda$  is the wave-length, while  $n$  may be 1, 2, 3, or 4, etc., according to the number of the band which we are considering. The quantity  $a+b$  is the distance from the edge of one line upon the grating to the corresponding edge of the next— $a$  being the width of the line, and  $b$  the unruled space between it and the next line. The position of the bands with reference to the slit  $S$  and the grating  $G$  is shown in Fig. 3 ( $r_1, r_2, r_3$ , etc.).

If the light which enters the slit be violet instead of red, the diffraction bands will have positions nearer the slit ( $v_1, v_2, v_3$ , etc.). If white or other composite light be used overlapping diffraction images of the slit will be produced, and these will be so arranged with reference to each other as to form as a series of spectra on either side of the slit.

If, as in the discussion of the prismatic spectrum, we take  $r_1$ , etc., to represent the longest visible wave-length, and  $v_1$ , etc., the shortest, we shall have the intervening spaces in the diagram, viz.,  $v_1 \dots r_1, v_2 \dots r_2, v_3 \dots r_3$ , etc., occupied by spectra. These are called for convenience spectra of the first, second, third, etc., order. It will be noticed that with the exception of the first and second all the spectra overlap.

The formula given above defines completely the position and character of the spectra produced by a grating. It will be seen, for example, that the distance out from the slit to the position occupied by any given wave-length, measured by the sine of the angle  $\alpha$ , is proportional to the wave-length. The violet end of the diffraction-spectrum is therefore always nearest the slit. The distribution of wave-lengths throughout the spectrum, moreover, is a uniform one, instead of varying as in prismatic spectra. It is on account of this property that the name *normal spectrum* is applied to a spectrum produced by means of a grating. It is obvious from the formula likewise that  $\sin \alpha$  for a given wave-length is directly proportional to the number of lines in a centimeter contained upon the grating, so that the dispersion is entirely a question of the fineness of the ruled surface.

**Advantages and Disadvantages of Diffraction-spectra.**—The chief advantage of the diffraction-spectrum lies in the simplicity of the law of distribution of wave-lengths. On this account it affords much the best means for the accurate measurement of wave-lengths. It is also a great advantage

to be able to secure any desired degree of dispersion without recourse to the complication and inconvenience arising from the use of a train of prisms. On the other hand, the prismatic spectrum, by equal dispersion, is much more intense, since all the dispersed light goes to the formation of a single spectrum instead of a double series of spectra, and because the losses by reflection, etc., are much less important. Spectra furnished by gratings, moreover, show vagaries in the distribution of intensities, which depend in a complicated manner upon the nature of the ruling. Certain spectra will be very weak or altogether missing, others of abnormal brilliancy. Some spectra will be strong in a certain color and faint in others, etc. The consequence is that diffraction-spectra are ill fitted for use where the question of the relative intensity of the various wave-lengths of a source of light is to be determined.

**Classes of Spectra.**—Thus far those spectra have been considered in which all wave-lengths between the extreme red and the extreme violet are present. Such spectra are produced by the radiation from glowing solids or liquids; they are called *continuous spectra*.

Where the source of light is an incandescent vapor or gas, radiation is confined to one or more definite wave-lengths. Spectral images corresponding to these wave-lengths only are present in the spectrum, which consists of a group of bright lines, each possessing the color due to its particular wave-length. The intervals lying between are black. Such spectra are called *bright-line spectra*.

A third and very important class of spectra consists of those produced by the passage of light (which would otherwise form a continuous spectrum) through an absorbent medium. This medium may be a solid or liquid, or it may be a vapor. In accordance with the law of Kirchhoff, there is, however, a perfectly definite relation between radiation and absorbing power. Each material, in a word, absorbs the precise wave-length or wave-lengths which it is capable of radiating, and in the same proportion. Gases and vapors, therefore, cut out well-defined and perfectly monochromatic lines from the transmitted light, and thus produce what are called *dark-line spectra*. Solids and liquids, on the other hand, absorb selectively and continuously throughout extended regions, and the spectrum of the rays transmitted by them is crossed by dark transverse bands, varying in position and width and also in density and sharpness of definition according to the character of the medium. Frequently the absorption is such as to weaken or destroy one end of the spectrum instead of producing a band.

**Relation of Bright-line and Dark-line Spectra: the Fraunhofer Lines.**—When, in 1817, Fraunhofer made the first application of the narrow slit to the analysis of sunlight, he observed that the solar spectrum was crossed by numerous fine black lines. Repetition of the experiment showed him that these lines were always present, and that they were always in the same positions. Fraunhofer made a map of the spectrum in which he designated some of the lines alphabetically. It is by the letters which he assigned

FIG. 4.

to them that they are still known. Fig. 4 shows the positions of a few of the most important Fraunhofer lines in the prismatic spectrum. The wave-lengths are given in the following table:

TABLE I.

Wave-lengths, in millionths of a meter, of the principal Fraunhofer lines. Rowland's values to four places.

| Line.  | Wave-length.             | Line.  | Wave-length.                 |
|--------|--------------------------|--------|------------------------------|
| A..... | 0.75914μ                 | E..... | 0.52704μ                     |
| B..... | 0.6867                   | F..... | 0.4861                       |
| C..... | 0.6563                   | G..... | 0.4308                       |
| D..... | 0.5896 (D <sub>1</sub> ) | H..... | 0.3908 (H <sub>1</sub> )     |
|        | 0.5890 (D <sub>2</sub> ) |        | 0.3833 (H <sub>2</sub> or K) |

It was nearly half a century after Fraunhofer's observations before the cause of the dark lines in the solar spectrum was determined and their supreme importance in the science of spectroscopy was appreciated. In the meantime the bright-line spectra obtained from the burning vapors of

various metals had been described, and finally, about the middle of the century, certain coincidences of position having been noticed, it began to be suspected that there was some connection between the two classes. Finally Kirchhoff and Bunsen in Heidelberg took the matter up, and by means of an exhaustive series of experiments demonstrated that the dark lines of Fraunhofer are produced by absorption, by the sun's atmosphere, and by that of the earth; also that the materials producing absorption in the sun's atmosphere are, in part at least, identical with those which go to form the crust of the earth. The proof is based in part upon the celebrated experiment of the reversal of the sodium lines, which consists essentially in placing in the path of the rays from any incandescent source of light which

FIG. 5.

In front of an arc-lamp (A, Fig. 5) is placed a condensing lens (C), a vertical slit (S), an object-lens (O), and a prism (P). The lamp A should be tipped back so as give the bright continuous spectrum of the light from the crater of the upper carbon. Before the slit, at B, a Bunsen burner is placed, into the flame of which metallic sodium is introduced. The sodium vapor thus produced rises into the path of the ray from A and absorbs light of wave-lengths 5890 and 5896, to which rays it is opaque.

In the spectrum upon the screen *ab* two dark lines are formed, but these lie so close together that under ordinary conditions they are merged into a single heavy black band.

FIG. 6.

By slight modifications of the apparatus it is possible to project upon the screen, one above another, spectra containing the bright line due to incandescent sodium, superimposed upon a continuous spectrum, and the artificially produced Fraunhofer

line D, and thus to note the precise coincidence in the positions of the two. See Fig. 6.

The direct evidence of experiments like the above was supported by measurement of the position of thousands of dark lines in the solar spectrum and of the positions of the thousands of lines obtained by the incandescence of the various chemical elements. The comparison of the two showed the identity of many of the solar lines with those of well-known terrestrial substances. In the cases of metals possessing complicated-line spectra, such as iron, nickel, and calcium, the number of lines in coincidence was so great as to preclude all question of agreement by chance.

A most important example is afforded by the metal iron,

FIG. 7.

in the spectrum of the vapor of which hundreds of lines have been mapped and found to coincide with solar lines.

Kirchhoff and Bunsen explored the entire visible spectrum in the most painstaking and precise manner, measur-

ing the position of thousands of lines in the spectrum of the sun and in those of the different elements. For this purpose they used a spectrometer with a train of four lenses. The results were mapped upon a large scale. Ångström and Thalen made a set of equally careful measurements and produced maps agreeing well with that of the former servers. By the use of concave gratings and photographic plates Rowland has since been able to obtain absolute values of wave-lengths much more accurate than any hitherto made by the system of hand measurements, while Abney and also Cornu, likewise by photographic methods, have extended the spectrum map to regions lying far beyond the limits of visibility in the direction of the red and of the violet. Fig. 7 shows a small portion of the solar map (in the green), which contains lines due to the vapors of iron and of calcium. The coincidence of these with certain bright lines in the spectra of those metals is also indicated.

The application of spectrum analysis in astronomy has led to extraordinary extensions of our knowledge of the chemical constitution and physical condition of the sun, and even of fixed stars, comets, and nebulae. The attachment of the spectroscopic eyepiece to the telescope, for example, has made it possible to explore the surface of the sun in detail with reference to its constitution. Only a few of the numerous striking and beautiful results obtained in this field of research can be mentioned here.

#### *Spectrum of the Chromosphere and Protuberances.*

—If the telescope be so adjusted that the field of view, through the slit of the spectroscopic eyepiece (the slit being perpendicular to the limb of the sun), comprises a portion of the sun's face, the chromosphere, with a protuberance, and the sky lying beyond the limits of the latter, as shown in Fig. 8, a triple spectrum will be formed: (1) The spectrum of the photosphere, consisting of the continuous spectrum of the underlying molten constituents of the body of the sun, crossed by the black lines produced by passage through the cooler gases of the solar atmosphere; (2) the spectrum of the protuberance, which consists of the bright lines of the cooler gases corresponding to C and F of Fraunhofer, and a line known as D<sub>3</sub>. Until 1895 it was believed that this line had no counterpart among the lines of terrestrial elements, and it was accordingly ascribed to a hypothetical solar element to which the name *helium* was given. In that year, however, the chemist Ramsay announced the discovery of helium line in the spark discharge of a gas obtained from cleveite, a mineral found in Norway. This bright spectrum is superimposed upon a faint solar spectrum of the usual character, due to diffused or stray sunlight. (3) Diffused sunlight also fills the remainder of the slit, which otherwise would have for its field the blackness of space, so that beyond the limits of the chromosphere we can still distinguish the faint spectrum to which reference has just been made.

This method makes it possible to determine the height to which a given constituent of the chromosphere, such as hydrogen, rises above the limb of the sun, the temperature under which it exists, and even the motions which it undergoes.

The hydrogen-line (F), for example, seen through a narrow slit, the field of which extends across the sun, into and through the chromosphere, sometimes appears as a doublet, the line being reversed at the limb and converging to a point. This effect is indicative of the pressure. Frequently the reversed line of the chromosphere is distorted in a manner of which Fig. 10 is typical. A displacement shows that the glowing gases are moving.

toward the observer (when the displacement is to the violet) or away from him (when the displacement is toward the red).

FIG. 10.

The same displacement of the lines in the spectra of fixed stars is used in computing the component of their velocity which lies in the line of sight.

The spectra of nebulae and comets show for these bodies a gaseous constitution. Instead of a continuous spectrum with absorption lines, we find in the case of the former class two or three bright lines, ascribable to hydrogen and nitrogen. (See Fig. 11.) Comets also show bright bands which correspond in position to the groups of lines which constitute the spark spectrum of the hydrocarbons. See Fig. 12.

Applications to Chemical Analysis.—The fact that each

FIG. 11.

metal when vaporized and heated emits light of certain definite wave-lengths affords an important means of detecting its presence.

FIG. 12.

The method is used chiefly for the determination of the alkaline metals and the metals of the alkaline earths, since these almost without exception can be made to give their characteristic colors at the temperature of the Bunsen flame. For such purposes a

FIG. 13.

one-prism spectroscopy with an arbitrary scale is commonly used, and the bright lines are mapped with reference to that scale. No accurate determination of wave-lengths is necessary, since the object is simply to recognize the existence of certain well-defined lines, or groups of lines, and to distinguish them from one another. Fig. 13 shows the grouping of lines in the prismatic spectra of the most important of the above-mentioned classes of metals.

Spectrum analysis by means of the bright lines of the elements is a qualitative method of the greatest delicacy.

In the case of the metals easily volatilized in the Bunsen burner it is possible, according to the determinations of Kirchhoff and Bunsen, and of Simmler, of Cappel, and others (see Kayser, *Lehrbuch der Spektral Analyse*, p. 88), to detect the following minute quantities:

TABLE II.

| Metal.         | Amount detected, grammes. | Metal.         | Amount detected, grammes. |
|----------------|---------------------------|----------------|---------------------------|
| Cæsium.....    | $4.00 \times 10^{-6}$     | Strontium..... | $3.33 \times 10^{-6}$     |
| Rubidium.....  | $1.43 \times 10^{-7}$     | Calcium.....   | $2.00 \times 10^{-6}$     |
| Potassium..... | $3.33 \times 10^{-7}$     | Manganese..... | $1.2 \times 10^{-6}$      |
| Sodium.....    | $7.16 \times 10^{-11}$    | Iodine.....    | $5.00 \times 10^{-7}$     |
| Lithium.....   | $1.66 \times 10^{-6}$     | Thallium.....  | $2.00 \times 10^{-6}$     |
| Barium.....    | $5.00 \times 10^{-7}$     | Copper.....    | $8.5 \times 10^{-6}$      |

The spectrum of the metals depends to a great extent upon the temperature of the incandescent vapor. Heating does not shift the position of the lines, but it increases their brilliancy and brings into view new ones, which had been too weak to be seen in the spectrum of the cooler vapor. Sodium, for example, which in the Bunsen flame shows only the well-known double line D, has been found by Liveing and Dewar to possess at higher temperatures at least seven other pairs of lines distributed throughout the spectrum from red to violet. A convenient method of getting high-temperature spectra consists in volatilizing the metals in the electric spark. In this way the brilliancy of the spectrum is enhanced, and new metals, too refractory for vaporization at flame-temperatures, are made amenable to the methods of spectrum analysis. The delicacy of the method of the spark-spectrum, in the case of various metals, many of which give no line-spectrum whatever in the Bunsen flame, is given in table III.

TABLE III.

| Metal          | Amount detected, grammes. | Metal.        | Amount detected, grammes. |

Absorption Phenomena by Transmission through Solids and Liquids.—Spectrum analysis is not confined to the detection of elements by means of the bright lines of their emission spectra and the corresponding black lines in the spectra of the sun and stars. It makes use also of the selective absorption which light suffers when transmitted through various solids and solutions. In cases in which the absorption is confined to certain definite regions dark bands are formed, the position of which indicates the character of the absorbing medium, while the density and width of the

FIG. 14.

bands enables the experimenter to estimate the strength of the solution with considerable accuracy. Well-known cases are those of chlorophyll and blood, the spectra of which are shown in Fig. 14. Cerium, didymium, and other of the

rare earths lend themselves peculiarly to this method, on account of the sharpness of their bands. (See Fig. 15.) When

FIG. 15.—Absorption bands due to didymium.

small dispersion is used some of the narrower bands might easily be mistaken for true Fraunhofer lines, but higher dispersion shows them in their true character.

Even when no sharply marked bands are produced a spectrophotometric study of the absorption spectrum often

FIG. 16.

affords definite information concerning the character of the transmitting medium. A solution of potassium chromate, for example, submitted to measurement gave the curve of brightness shown in Fig. 16, in which abscissas are wave-lengths and ordinates are percentages of light transmitted. Pigments, viewed by reflected light, give spectra, likewise capable of spectrophotometric analysis and characteristic of the chromatic properties of the material. Figs. 17a and 17b

FIG. 17 a.

of a glowing body at different stages of incandescence and comparison of the same, wave-length by wave-length, with the spectrum of a standard lamp, the development of radiation with rise of temperature can be definitely determined.

Fig. 18 shows the results of such an investigation of the spectrum of platinum between 700° C. and 1,000° C. The ordinates are ratios of the brightness of the platinum spectrum to that of the standard lamp, which was an electric glow-lamp maintained as nearly as possible at a temperature of incandescence corresponding to that of a luminous gas-flame. The adjustment was such that the brightness of the platinum spectrum at 1,000°, wave-length 59μ, was equal to that of the corresponding wave-length in the spectrum of the standard.

FIG. 17 b.

**Invisible Parts of the Spectrum (the Infra-red and Ultra-violet).**—When a spectrum is produced by refraction or diffraction, the only rays capable of affecting the retina lie between wave-lengths 39μ and 76μ. Rays of wave-lengths both longer and shorter than the above are present, however, and these constitute the *invisible spectrum*. Waves greater than 76μ find positions lying beyond the extreme limit of the red. They form what is termed the region of the *infra-red*. Waves shorter than 39μ are all more strongly refracted than the rays of the visible spectrum. They lie beyond the limits of the violet and constitute the *ultra-violet* spectrum.

In the investigation of these invisible rays indirect methods have to be used. For the infra-red the rays may be allowed to fall upon some surface which becomes luminescent (phosphorescent) under their action. This is the method used by Draper, by Becquerel, and by Lommel and others.

The result of this process is to cause those portions of the luminescent surface upon which the infra-red rays fall to shine, while the other portions remain dark. In this way the intenser portions of the infra-red spectrum can be explored, and if the law of the dispersion apparatus is known they can be mapped.

It is possible also, as has been shown by Abney, to obtain photographic plates which are sensitive to long wave-lengths, and by the use of these to photograph a considerable portion of the infra-red spectrum.

The most complete method of studying the invisible regions beyond the red consists in measuring the intensity of the rays directly by means of their heating effect. For this purpose Fizeau and Foucault used thermometers; Laman-sky, Mouton, Dessains, Nichols, and others the linear thermopile; Langley, Ångström, Snow, Paschen, and many other observers the bolometer.

By these various methods it is known that the region of the infra-red is similar to the visible region of the spectrum in nearly every particular, but that it comprises a very much greater range of wave-lengths. While the visible spectrum is all included within about an octave, the bolometer gives evidence of waves more than ten times as long as the longest visible ray. If the spectrum of an incandescent solid be explored by means of thermopile or bolometer, the infra-red spectrum will be found to be continuous, the intensities rising to a maximum in some region, the wave-length of which depends upon the temperature of the source. See Fig. 18, which gives Langley's curve of intensities in the spectrum of a luminous gas-flame.

FIG. 18.

If the source have a temperature below the red heat an infra-red spectrum will still be found to exist, the intensities of which are all less and the maximum in a region of greater wave-length. The curve of intensities, moreover, will disappear on the side toward the red, before the boundary of the visible spectrum is reached. See Fig. 21.

FIGS. 19, 20, and 21, showing the curves of intensities of sunlight, of gas flame, and of a solid below red heat, respectively.

If the source be sunlight we find its spectrum crossed by dark lines and also by bands due to absorption on the part of the atmosphere of the earth. The curve then appears as in Fig. 19, which is also from measurements by Langley.

If the source be a metallic vapor the bolometer indicates the extension of a bright-line spectrum characteristic of that metal throughout the infra-red. Fig. 22 is a diagram giving the results of bolometric exploration of the spectrum of potassium, made by Snow. Abscissas are wave-lengths and

FIG. 22.

ordinates are intensities. It will be seen that there are three bright lines between  $1.0\mu$  and  $1.3\mu$ , and probably a group of lines, which could not be resolved by means of the bolometer, in the region  $1.5\mu$ .

In the ultra-violet region of the spectrum the intensity of radiation is too small to admit of the general use of bolometric measurements. These shorter wave-lengths are, however, readily studied by photography, and they can also be rendered visible by the use of a luminescent (fluorescent) substance, as has been shown by H. Becquerel, Soret, and others. Among the materials which give back visible rays when exposed to the action of the ultra-violet are chlorophyll solution, petroleum, various coal-tar dyes in solution; also uranium-glass and some sorts of fluor-spar. See FLUORESCENCE.

Of the two methods, the photographic is by far the more complete and satisfactory. By means of the sensitive plate and the concave grating, maps giving every detail may be obtained. If the apparatus be of such a character that the rays pass through glass, the spectrum will seem to come to an end in the neighborhood of  $.32\mu$ , because glass becomes opaque to still shorter wave-lengths. If quartz lenses be substituted, or if concave mirrors be used instead of lenses, the map can be extended even further beyond the violet.

The results of investigations in the ultra-violet, as in the case of those upon the infra-red of the spectrum, show that no sudden changes take place as we pass beyond the limit of visibility. Sunlight, in the ultra-violet, still shows a continuous spectrum crossed by a multitude of dark lines: glowing vapors, such as those of the electric arc, show groups of lines which to an eye capable of vision in such rays would constitute a bright-line spectrum of the usual type.

See, further, article SPECTROSCOPE; also Schellen, *Spectrum Analysis*; Roscoe, *Lectures on Spectrum Analysis*; and the works of Lockyer, Huggins, Langley, Vogel, K. Ångström, Abney, H. Becquerel, Soret, etc. E. L. NICHOLS.

**Spectrum Analysis:** See SPECTROSCOPE and SPECTRUM.

**Speculation:** See POLITICAL ECONOMY.

**Speculum** [Lat., mirror]: in optics and astronomy, a reflecting surface, usually of metal, though the term has also been frequently applied to unsilvered glass since the introduction of silvered-glass telescopes by Foucault and Steinheil in 1857. See TELESCOPE.

**Spedding, JAMES:** scholar; b. near Bassenthwaite, Cumberland, England, in June, 1808. He studied at Trinity College, Cambridge, of which college he was afterward made an honorary fellow; graduated in 1831. His life-work was the study and exposition of Bacon, begun by a pitiless exposure of Macaulay's showy and inaccurate essay on Bacon, *Evenings with a Reviewer* (privately printed in 1848 and reissued in 1882). His great edition of the *Works of Francis Bacon* was published in 7 vols. in 1857-59. In this he was assisted by R. L. Ellis and D. D. Heath. In 1870-76 he published a *Life and Letters of Francis Bacon*, including all his occasional writings, also in 7 vols.; and in 1878 *Life and Times of Francis Bacon* (2 vols.). Besides his work on Bacon he was the author of *Publishers and Authors* (1867) and *Reviews and Discussions* (1869). D. in London, Mar. 9, 1881. H. A. BEERS.

**Speech:** See LANGUAGE and ACOUSTICS (*The Voice*).

**Speed, JAMES:** lawyer; b. in Jefferson co., Ky., Mar. 11, 1812; graduated at St. Joseph's College 1828; studied law at Transylvania University; began its practice at Louisville 1833; was a member of the Legislature in 1847, State Senator 1861, U. S. Attorney-General Nov., 1864-July, 1866, and in the same year was chosen president of the Philadelphia Loyalists' convention; was Professor of Law in the University of Louisville. D. at Louisville, Ky., June 25, 1887.

**Speed, JOHN:** antiquary; b. at Farrington, Cheshire, England, in 1542; was a tailor in London until late in life, but at the same time was amassing an extensive knowledge of English antiquities, and was enabled by Sir Fulke Greville to publish a costly and valuable series of works. He published anonymously about 1590 a treatise on the *Genealogies of the Scriptures*, afterward prefixed to the first edition of King James's Bible (1611), but his first appearance as an author was in 1608, when he printed fifty-four maps of various counties and cities, and engravings of antiquities of England and Wales, which were incorporated into *The Theatre of the Empire of Great Britain* (folio, 1611). In the same year he published his *History of Great Britain under the Conquests of the Romans, Saxons, Danes, and Normans*. D. in London, July 28, 1629.

**Speedwell:** a plant of the genus *Veronica* of the family *Scrophulariaceae*. The species are very numerous, comprising annual and perennial herbaceous plants and small shrubs,

natives of temperate and cold climates in all parts of the globe, some of them growing in wet ditches or in marshes, others on the driest soils, but all having very beautiful blue, white, or pink flowers. Revised by CHARLES E. BESSEY.

**Spelchorn, or Spichern:** See SAARBRÜCKEN.

**Speler:** See SPEYER.

**Speke, JOHN HANNING:** explorer; b. at Jordans, Somersetshire, England, May 4, 1827; entered the army in 1841; served in India and in the Crimean war; accompanied Capt. Richard F. Burton in the expedition which resulted in the discovery of the great lakes of Central Africa, and afterward was at the head of another expedition (with Capt. Grant) which discovered the connection of the Nile with those lakes. Capt. Speke published a *Journal of the Discovery of the Source of the Nile* (1863), and *What Led to the Discovery of the Source of the Nile* (1864); received gold medals from the geographical societies of France (1860) and England (1861), and from the King of Italy; and was engaged after his second expedition in a bitter controversy with Capt. Burton as to the merits of their respective discoveries. He accidentally shot himself near Bath, Sept. 15, 1864, and died on the same day.

Revised by M. W. HARRINGTON.

**Spelman, Sir HENRY:** antiquary; b. at Congham, Norfolk, England, in 1562; graduated at Cambridge about 1580; studied law at Lincoln's Inn, but devoted himself chiefly to archaeology; was in 1604 high sheriff of Norfolk; was employed by James I. upon important commissions; was knighted about 1612, in which year he withdrew from public business and settled in London; published his treatise *De Non Temerandis Ecclesiis; of the Rights and Respects due to Churches* (1613). D. in London in 1641, and, by special order of Charles I., was buried in Westminster Abbey, near the monument of Camden. Vol. i. of his *Glossarium Archæologicum*, extending to the letter L, was published 1626; vol. ii., completed by his son, Sir John, and by William Dugdale, appeared in 1664, and the whole work was issued in a single folio volume in 1687. Vol. i. of the *Concilia* was issued in 1639; vol. ii., chiefly by Dugdale, in 1664. The *Reliquiæ Spelmannianæ* (Oxford, folio, 1698), with a *Life*, was edited by Bishop Edmund Gibson.—His son, Sir JOHN, was knighted 1641 "in consideration of his father's good services both to Church and state," and was made master of Sutton's Hospital. He edited the *Saxon Psalter* (1641) and a *Life of Alfred the Great* (Lat. trans. 1678; Eng. original edited by Thomas Hearne, 1709). D. at Oxford, July 25, 1643.—EDWARD SPELMAN, a great-grandson of Sir Henry, published an elegant translation of Xenophon's *Anabasis* (1742) and of the *Roman Antiquities* of Dionysius Halicarnassus (4 vols. 4to, 1758). D. in Norfolk in 1767.

**Spelt** [O. Eng. *spelt*, from Lat. *spel'ta*, spelt]: the *Triticum spelta*, probably the far of the ancient Romans and the *zea* of the Greeks; a grain somewhat resembling wheat, but distinct from it. It can be grown on poorer soils than those which are required for wheat. It is much raised in parts of Europe, and crops of it are occasionally seen in the U. S., as in Virginia. In quality it is much inferior to wheat. *T. bengalense* is raised in India. Lesser spelt, or St. Peter's corn (*Triticum monococcum*), called also one-grained wheat, is raised to some extent on poor soils in Europe.

**Spelter:** the commercial name for zinc in pigs or blocks. See ZINC.

**Spencer:** city; capital of Owen co., Ind.; on the White river, and the Penn. Railroad; 52 miles S. W. of Indianapolis (for location, see map of Indiana, ref. 8-C). It is in an agricultural, stock-raising, and lumbering region; has valuable building-stone quarries, block and cannon coal mines, woollen, flour, saw, and planing mills, machine-shops, and pork-packing house; and contains a State bank with capital of \$50,000, a private bank, and two weekly newspapers. Pop. (1880) 1,655; (1890) 1,868.

**Spencer:** town; capital of Clay co., Ia.; on the Little Sioux river, and the Chi., Mil. and St. P. Railway; 80 miles N. W. of Fort Dodge (for location, see map of Iowa, ref. 2-E). It is in an agricultural and stock-raising region, and contains a national bank with capital of \$100,000, a State bank with capital of \$25,000, 2 private banks, and 3 weekly newspapers. Pop. (1880) 1,392; (1890) 1,813.

**Spencer:** town; Worcester co., Mass.; on the Boston and Albany Railroad; 11 miles S. W. of Worcester, one of

the county-seats (for location, see map of Massachusetts, ref. 3-F). It contains a public high school, the Richard Sugden Public Library (founded in 1857), electric railway, a national bank with capital of \$150,000, a savings-bank, and three weekly newspapers. The principal industries are the manufacture of shoes and wire. Here, it is claimed, is the largest shoe-factory in the world. Spencer was originally in the grant of Leicester; was made the West Parish of Leicester in 1744; incorporated as a town under its present name in 1753; and its first church was organized in 1744. Pop. (1880) 7,466; (1890) 8,747. EDITOR OF "LEADER."

**Spencer, HERBERT:** philosopher; b. in Derby, England, Apr. 27, 1820; was an only surviving child. His father and grandfather were teachers. Of delicate health in boyhood, he was subjected to little outside pressure, his father, a man of strong character, more than usual breadth of culture, and original views, supervising his early education, but leaving him very much to himself. At the age of thirteen he was sent to study with an uncle, the Rev. Thomas Spencer, a liberal clergyman and a scholar, at that time perpetual curate of Hinton Charterhouse, near Bath. Here he remained three years, carrying on the study of natural history, begun in early childhood under his father's encouragement, and devoting himself to mathematics, where the originality of his mind was strikingly shown by the development of a taste and capacity for working out original problems. He then, too, became familiar with physical and chemical operations, his intellectual bias being strongly in the direction of experimental inquiry and original research. Deciding, in opposition to his uncle's wishes, not to prepare himself for a university career, he returned to Derby, where he was busied for a short time with inventions and miscellaneous study, and, after a brief interval of teaching, in 1837 entered the office of Sir Charles Fox, and began work as a civil engineer. After this he was engaged for several years on railways, devoting his spare time to scientific experiments and studies, and to occasional contributions to *The Civil Engineer and Architect's Journal*. The first indication of his awakening interest in other directions was given in 1842 by the publication in *The Nonconformist* of a series of letters on *The Proper Sphere of Government*. These were reprinted in pamphlet form during the following year, and are interesting as containing, in crude form, the first suggestions of many opinions on social questions afterward so fully developed in his maturer works. Growing discouraged with the prospects of his profession, he presently gave up engineering work and moved to London, where he secured a position on the staff of *The Economist* newspaper, of which in 1848 he became sub-editor. In 1850 he published his first considerable work, *Social Statics*, which was largely a development in more scientific form of the ethical and sociological ideas contained in his letters on government. The work was a treatise on social science, based upon the conception of the evolution of society through the operation of natural laws; and, though Spencer afterward grew dissatisfied with its metaphysical implications, it excited widespread interest at the time on account of its original and advanced views. He then devoted himself to literary work, contributing elaborate articles on a large variety of subjects to the leading English reviews. But though the subject-matter of his work led him into widely diversified fields of knowledge and inquiry, his course of thought was systematic; and the numerous masterly essays which he published from 1852 to 1860 were mainly devoted to the elaboration and application to various important questions of the principle of evolution. These papers reappeared in the U. S. in the collections entitled *Illustrations of Universal Progress; Essays, Moral, Political, and Æthetic; Education, Intellectual, Moral, and Physical; and Recent Discussions in Science, Philosophy, and Morals*. In 1855 Spencer published a very able and original work entitled *The Principles of Psychology*, pronounced by J. S. Mill to be "the finest example we possess of the psychological method in its full power." In this work (afterward included in his larger treatise on the same subject) the doctrine of evolution was applied to the science of mind. Life is conceived as "the definite combination of heterogeneous changes, both simultaneous and successive, in correspondence with external coexistences and sequences"; and the ground taken is therefore that mental faculties throughout the whole scale of animal life, from lowest to highest, have been developed by experience through the intercourse of organisms with their environment, the principles of variation

and heredity being worked out as the outcome of the slow modification of what have been taken place during and perhaps even before. The work was so profound in exposition, and so quickly to the essence of the thought of the day, that it produced hardly any public impression. Spencer had proposed the cosmopolitan evolution in its broad outlines and in 1859, while engaged in an essay on the individual hypothesis, he reached the conclusion that it is a universal process, dependent upon the laws of matter and hence conformable to the orders of phenomena, and capable of being received and formulated. Being the great principle or law of the universe, changes of phenomena, involving the unfolding and on the other side and as the necessary corollary, the dissolution of all things, it seemed to offer the basis of a philosophy of nature from the point of view of evolution, according to the new philosophy. These implied questions of positive knowledge by universal principles. In other words, the comparison of evolution presented itself to him as the basis of a system of thought which was to be generated the empirical history of the human mind, and by virtue of which all branches of scientific knowledge were to be unified by reference upon the prime laws underlying them all. Though a rough sketch of the main outline of the system, as thus conceived to him at the time, was scribbled out almost immediately, it was not till the following year, 1860, that he otherwise memorable for the publication of Darwin's *Origin of Species*, that a detailed plan of the various connected works in which these cosmopolitan ways to be developed was finally drawn up, and not till 1869 that it was given to the world: himself of readers interested in such subjects in the form of a prospectus. This prospectus contained a complete outline of the ten volumes which were to be devoted to the carrying out of the task, and hence comparison of the analysis there given with the works themselves, so far as they have been issued, will show how clearly he must have had the whole and scheme of things set out in his mind, down to the minutest details, before he set himself to the penning of a single line. To the prosecution of this great enterprise the major part of the energies of his life has been from that time forth been devoted, and the *System of Synthetic Philosophy* has been actually brought within measurable distance of completion. Hardly have been left in the methodical distance, and will probably never be altogether filled up; but save for these lacunae the work stands in practically finished form. The introductory volume of the series, *First Principles*, was published in 1862, and was concerned with the establishment of those first or foundation principles which, those stated together in their most general and abstract statements, were in subsequent volumes to be worked out through the special phenomena of biology, psychology, sociology, and ethics. The initial book was to define the limits of philosophy, and thus to demarcate the position of two categories, the unknowable and the knowable, to the former of which is relegated the absolute infinite or unconditional, and all that pertains thereto, while the latter is meant to include the relative, finite, or conditioned, which alone constitutes the sphere and subject-matter of philosophy properly so-called. In this way Spencer aimed to clear the field of his inquiry of what he deemed to be the fruitless speculations of metaphysics, so that his proper work might be continuous with the sphere of science and strictly conform to its methods. Yet, while confining his attention within the limits of the phenomenal universe, Spencer shows that by the very terms of its cognition the mind cannot escape the non-mattering of an unknowable power, of which all phenomena are manifestations, and which remains the ultimate and unconditioned basis of consciousness, though, even the nature of human intelligence, it can be neither grasped nor understood. Covering these preliminary considerations in the space of something over 100 pages, *First Principles* proceeds to deal with the foundations of the universe, and here the law of evolution is broadly worked out and formulated in terms of matter and motion, or rather in terms of force, into which our conceptions of matter and motion are shown to be in the last analysis resolvable. These, as fundamental concepts of nature, furnish a proper basis for a superstructure of philosophy. All the phenomena of the universe, from their great features down to their minutest details, are necessary results of the persistence of force under its laws of matter and motion. This persistence of force gives rise, throughout the universe in general and detail, to successive redistributions of matter and motion, and these redistributions constitute evolution "where there is a predominant integration of matter and

dissipation of motion," and dissolution "where there is a predominant absorption of motion and dissipation of matter." The system thus set up by these changes and manifestations "as so far as we can see, into forms and states, each alternate phase of the process, pre-eminently upon the basis of space and time, in that no local condition determines," the tendency to that portion of the universe with which we are acquainted being now in the direction of evolution. There is thus reached the famous definition of evolution as "a course from an indefinite, incoherent homogeneity to a definite, coherent heterogeneity, accompanied by the dissipation of motion and integration of matter," or, as the author states more fully, "through continuous differentiations and integrations." This formula sums up and covers all the processes of development in nature and in mind on other words all things which we should call the ascending such as contrabanding and from the descending such as dissipation, from the unfolding of a planetary system to the spreading of a weaver's door, and from the growth of individual plants to the latest variations of social life. Thus their principles being thus laid down in their broadest and most abstract statements, Spencer proceeded to the task of working them out in greater detail through all the varied phenomena presented by the universe at large. First in order should properly have come the application of such principles to human nature, but this great division was passed over entirely, partly to quote his own words, because "even without it the volume is an extensive and partly because the introduction of organic nature after the proposed method had more immediate importance." Spencer therefore at once went to work upon the *Principles of Biology*, which he completed in two volumes in 1867. Here the principles of evolution are worked out through the phenomena of life and through the organization, one of the most profound and noteworthy parts being that dealing with the "laws of multiplication," and the inference to be deduced from them in regard to the "multiplication of the human race" and "human evolution in the future." This book furnished immensely more to know intelligence only as a "summarium of organization into the region of psychology; and in 1873 Spencer published *The Principles of Psychology*, also in two volumes. This new work was based upon the treatise of 1862, but contained many important modifications and extensions to which he had been led by his subsequent studies. It was an elaborate exposition of mental action grounded on biology and interspersed everywhere by the doctrine of evolution; and in it, in the opinion of many good judges, Spencer's powers as a thinker and writer reached their outstanding point. The fourth division of the system, *The Principles of Sociology*, outlined to occupy three volumes, is at present (1895) incomplete. The first volume of great bulk comprising the *Introductory* and the *Foundations of Sociology*, and a consideration of domestic institutions, was finished in 1874; and this was followed at irregular intervals by parts iv., v., and vi., treating of *Economical Institutions*, *Political Institutions*, and *Ecclesiastical Institutions*, all from the standpoint of evolution. But meanwhile, led by increasing ill health to fear less persistence in the work sketched out in the original prospectus might result in the final and most important portion of the work—*The Principles of Ethics*—being left unfinished altogether, Spencer decided to drop the uncompleted part of the Sociology, and to devote what remained of life and energy to carrying his principles forward as far as possible into the region of ethics. As a result of this determination appeared in 1879 the first installment of the proposed *Principles of Morality*, *The Facts of Morality*, which as the first systematic attempt to place ethical questions upon the new basis of evolution, attracts the closest attention. This was followed in 1891 by part iv., on *Justice*, a little work dealing with some of the most important issues at present under discussion; in 1892, by parts iii. and v., the *Foundations of Ethics*, and the *Elements of Individual Ethics*; and in 1894 by parts i. and ii., on negative and positive beneficence, the foundation morality being thus completed in two volumes. The volumes comprising the *Synthetic Philosophy*, vast as is the labor which they represent, do not exhaust the list of Spencer's works. In 1872 appeared in the International Scientific Series his delightful little introductory treatise on *The Study of Sociology*; and in preparation for his work in that subject, he gives supervisory the publication of the *Principles of Sociology*, an enormous cyclopaedia of facts designed to exhibit the characters of human societies of all types and in every stage of

development. Eight out of the proposed eighteen parts of this were produced, and then, owing to the enormous expense incurred and the scanty public support, Spencer found himself forced to relinquish the undertaking. The astounding extent of Spencer's life labors becomes all the more marvelous when one considers the impaired health which has for many years past incapacitated him for regular and persistent work. His life has thus necessarily been a very retired and, externally considered, a very uneventful one. He has never married, and has uniformly declined all university honors and invitations to join scientific societies. He visited the U. S. in 1882, remaining from August to November. See **POSITIVISM**.

WILLIAM HENRY HUDSON.

**Spencer, Jesse Ames, D. D.:** educator and author; b. at Hyde Park, N. Y., June 17, 1816; graduated at Columbia College 1837; studied theology at the General Seminary of the Protestant Episcopal Church; was ordained 1840; was rector of St. James's church, Goshen, N. Y., 1840-42; Professor of Latin and of Oriental Languages at Burlington College, New Jersey, 1849-50; editor and secretary of the Episcopal Sunday-school Union and Church Book Society 1851-57; declined the vice-presidency of Troy University 1858; was rector of St. Paul's, Flatbush, L. I., 1863-65, and was from 1869 Professor of Greek in the College of the City of New York. He was the author of a volume of religious *Discourses* (1843); *History of the English Reformation* (1846); *The East, Sketches of Travel in Egypt and the Holy Land* (1850); a widely circulated *History of the United States* (4 vols., 1856-60); *Greek Praxis* (1870); and *A Course of English Reading* (1873). Dr. Spencer was editor of *The Young Churchman's Miscellany* (1846-68); of 6 vols. of the Classical Series of Thomas K. Arnold (1846-50); of a *New Testament in Greek* (1847), with notes; *Cæsar's Commentaries* (1848), with notes and a lexicon; of *Pycroft's Course of Reading* (1844); of Archbishop Trench's *Poems* (1856); of a new edition of Prof. Alpheus Crosby's *Anabasis* (1875); and *Origen's Works* (vol. iv. in Ante-Nicene Library, 1885).

Revised by W. S. PERRY.

**Spencer, John, D. D.:** b. at Bocton, Kent, England, in 1630; educated at the King's School, Canterbury; graduated at Cambridge about 1650; obtained a fellowship at Corpus Christi College 1655; took orders in the Church of England; became rector of Landbeach, master of Corpus, and archdeacon of Sudbury 1667; prebendary of Ely 1672 and dean of Ely 1677. D. at Cambridge, May 27, 1695. He was the author of *A Discourse concerning Prodigies* (1663; 2d ed. 1665); *Dissertatio de Urin et Thummin* (1669). He is best remembered by his *De Legibus Hebræorum Ritualibus et earum Rationibus* (Cambridge, 1685), a work of great learning which excited much controversy. It maintained that the Hebrew ritual was almost entirely borrowed from the Egyptian—a view previously upheld by Maimonides in his *More Nevochim*, and by Sir John Marsham in his *Canon Chronicus Egyptiacus*, defended by Bishop Warburton and combated by Witsius, Shuckford, Dr. Woodward, and William Jones of Nayland, but now abandoned. Editions of this work were published at The Hague (1686), and at Leipzig (1705). A new edition, brought out by Dr. Leonard Chappelow (Cambridge, 2 vols., 1727), contained a supplementary book (the fourth) left in MS. by the author, and the whole work, with a memoir and a commentary by C. M. Pfaff, was published at Tübingen (2 vols., 1732).

Revised by S. M. JACKSON.

**Spencer, John Canfield, LL.D.:** lawyer; son of Ambrose Spencer (1765-1848), chief justice of the State of New York; b. at Hudson, N. Y., Jan. 8, 1788; graduated at Union College 1806; was private secretary to Gov. Daniel D. Tompkins 1807-08; admitted to the bar at Canandaigua 1809; became master in chancery 1811, judge-advocate-general on the northern frontier 1813, assistant attorney-general for Western New York 1815, member of Congress 1817-19, of the State Assembly 1819-20, being Speaker the latter year; State Senator 1824-28; commissioner to revise the statutes of New York 1829; special attorney-general to prosecute the murderers of William Morgan; was secretary of State and superintendent of common schools 1839-41; Secretary of War under President Tyler from Oct., 1841, to Mar., 1843, when he was transferred to the Treasury Department; resigned the latter post 1844 in consequence of his opposition to the annexation of Texas, and thenceforth devoted himself to the practice of his profession. The organization of the State asylum for idiots and the improvement of the common-school system were largely due to him, and he served on

many important State commissions. He edited, with a preface and notes, de Tocqueville's *Democracy in America* (2 vols., New York, 1838), and with John Duer and Benjamin F. Butler a *Revision of the Statutes of New York* (3 vols., Albany, 1846). D. at Albany, N. Y., May 18, 1855.

**Spencer, John Charles,** third Earl Spencer, better known as Lord Althorp: statesman; b. May 30, 1782; eldest son of George John, second Earl of Spencer; educated at Harrow and at Trinity College, Cambridge; was elected to Parliament 1804; held office under Fox as Junior Lord of the Treasury from Feb. 11, 1806 to Mar., 1807; sat in Parliament for the county of Northampton from Dec., 1806, till the passage of the Reform Bill 1832, during which long period he was one of the leading members of the opposition; was especially prominent in the attacks upon the financial policy of the Tory administrations; was Chancellor of the Exchequer and ministerial leader of the House of Commons in the reform ministry of Earl Grey 1830-34; succeeded his father as Earl Spencer in Nov., 1834, and soon afterward withdrew from active political life; devoted himself to scientific agriculture; was many years president of the Smithfield Cattle Club; was one of the founders and the first president of the Royal Agricultural Society 1838; was an active member of the Roxburghe Club for reprinting rare books; and vice-chairman of the Society for the Diffusion of Useful Knowledge. D. at Wiseton Hall, Nottinghamshire, Oct. 1, 1845. See Bagehot, *Biographical Studies* (1881), and Myers, *Lord Althorp* (1890).

F. M. COLBY.

**Spencer, John Poyntz,** Earl: statesman; b. at Spencer House, London, Oct. 27, 1835; educated at Harrow and Cambridge; entered Parliament 1857, but succeeded to the peerage in the same year; Lord-Lieutenant of Ireland 1868-74; Lord President of the Council 1880; again Lord-Lieutenant of Ireland 1882-85; for a second time Lord President of the Council in the Gladstone administration 1886; First Lord of the Admiralty in the Gladstone government of 1892.

**Spencer, Sara (Andrews):** reformer; b. at Savona, N. Y., Oct. 21, 1837; educated in high and normal schools in St. Louis, Mo.; was a teacher from the age of sixteen till her marriage in 1864 with Henry C. Spencer. They removed to Washington, D. C., where they founded a Spencerian Business College. In 1871-72 Mrs. Spencer defeated attempts to license the "social evil" in Washington. On Apr. 14, 1871, Mrs. Spencer and seventy-two other ladies in Washington were refused the right to register and vote. She brought suit in the D. C. Supreme Court, and Judge Carter's decision that "women are citizens, but have not the right to vote without local legislation" was reaffirmed by the U. S. Supreme Court in 1874. Mrs. Spencer represented the National Woman's Suffrage Association at the Republican presidential convention in Cincinnati in 1876, addressing the platform committee and the convention; engrossed, signed, and with five other women presented the woman's *Declaration of Rights* at the Centennial celebration in Independence Square, Philadelphia, Pa., July 4, 1876. She was vice-president of the first seven congresses of women 1873-90, representing the District of Columbia; was official delegate from the District to national conference of charities seven years, 1881-88; since the death of her husband in 1891 has been president and proprietor of Spencerian Business College, District of Columbia. She has published *Problems on the Woman Question* (Washington, 1871) and *Thirty Lessons in the English Language* (1873).

SUSAN B. ANTHONY.

**Spencer Rifle:** a breech-loading magazine-gun, extensively used as an arm for the Union cavalry during the civil war in the U. S. It is characterized by having in the butt of the stock a magazine holding seven cartridges, which are brought one by one into the chamber by a movement of the trigger-guard as a lever, which at the same time throws out the shell of the exploded cartridge. A new magazine can be inserted whenever the cartridges have been exhausted, or the magazine may be shut off and the rifle used as a single breech-loader. See **MAGAZINE-GUNS**.

**Spener, Philipp Jakob:** "The Father of Pietism"; b. at Rappoltsweiler, Upper Alsace, Jan. 13, 1635; studied at Strassburg, Tübingen, and Basel, principally theology; became private tutor to the princes Christian and Charles of the Palatinate, and pastor in Strassburg and lecturer in the university in philology and history 1663; was appointed first pastor in 1666 at Frankfort, where he instituted his famous *collegia pietatis* (prayer-meetings), which finally brought him into conflict with the orthodox clergy; became preacher to

ification (see FATS) cetyl alcohol and palmitic acid. The ethereal nature of spermaceti was distinctly recognized by Chevreul (*Recherches sur les Corps gras*). Spermaceti was formerly much used in the production of sperm-candles, which are no longer so common as in the prosperous days of the sperm-whale fisheries, the decline of which dates from the general introduction of refined petroleum and paraffin. Spermaceti burns with a bright, clear flame like wax. The standard sperm-candle, which is the common unit of comparison for photometric experiments in Great Britain and the U. S., is taken to burn 120 grains of sperm in an hour, which it rarely does with accuracy. Revised by LEA REMSEN.

**Sper'maphytes** [from Gr. σπέρμα, seed + φυτόν, plant]: another name for the ANTHOPHYTES (q. v.).

**Spermatozo'a** [Mod. Lat.; Gr. σπέρμα, seed + ζῶν (plur. ζῶα), animal, living creature]: the male reproductive cells of animals, which by union with the female cell (egg) render the latter able to develop. They consist largely of the cell-nucleus with the addition of other accessory structures to facilitate the union with the egg (impregnation). In shape they vary greatly, but the most common shape recalls the tadpole. In these forms there is a head, composed of the nucleus, followed by a "middle piece," and this in turn by the tail, which may either be thread-like, or may have an undulatory membrane attached to it. Usually the spermatozoa have the power of motion, by means of the vibrations of the tail, but in some forms they are motionless. Recent investigations show that both nucleus and "middle piece" are concerned in impregnation; the tail and analogous structures play no part after the union. J. S. KINGSLEY.

**Sperm Oil**: See OILS and SPERMACEITI.

**Spermophile**: any rodent of the genus *Spermophilus*. See PRAIRIE-SQUIRREL.

**Sperm-whale**: See CACHALOT and PHYSETERIDÆ.

**Spessartite**: See GARNET.

**Speusip'pus** (in Gr. Σπύσιππος): philosopher; b. at Athens about 395 B. C.; a nephew of Plato; received the instruction of his uncle, whom he accompanied to Syracuse, and succeeded as president of the Academy. D. at Athens in 339 B. C. Of his writings nothing is left. J. R. S. S.

**Speyer, or Speler, sp'fer**: city and railway junction; capital of Rhenish Bavaria, at the junction of the Speyerbach with the Rhine (see map of German Empire, ref. 6-D). It has some sugar-refineries and manufactures of vinegar and tobacco, and carries on an active trade in grain, timber, and wine on the Rhine. It is one of the oldest cities of Germany, and in the Middle Ages the German emperors often resided and held their diets here. Nevertheless, it has only one monumental building, the cathedral, erected in the eleventh century, thoroughly restored in 1858, and one of the finest church buildings of Germany. The other great edifices Speyer once possessed were destroyed by the French, who twice conquered and devastated the city. Pop. (1890) 17,585. Revised by M. W. HARRINGTON.

**Spezia, spà't'si-àa**: town; in the province of Genoa, Italy; beautifully situated on a gulf of the same name in lat. 44° 7' N., lon. 9° 48' E. (see map of Italy, ref. 4-C). The old walls and gates of Spezia have been mostly demolished in the course of the changes necessitated by the rapid growth of the town consequent upon the construction of the naval arsenal. The town is the chief naval station of Italy and is defended by formidable batteries; it has extensive ship-building yards, docks, etc., a foundry, and manufactures of sail-cloth, white lead, cables, and leather. It is the seat of a school of navigation, and is much frequented as a seaside resort. Pop. about 19,860.

**Spezzia, spet'si-àa**: an island at the entrance of the Gulf of Nauplia, Greece; has a fine harbor; became distinguished in the Greek revolution (1821-29). The inhabitants are mostly engaged in commerce and navigation. Area, 26 sq. miles. Pop. (1890) 5,192. E. A. G.

**Sphag'num** [Mod. Lat., from Gr. σφάγνυς, a kind of moss]: a large and interesting genus of mosses, many species of which grow in the U. S., mainly in bogs, forming deep, spongy masses, almost always damp. They are called peat-mosses, being the principal ingredient in pure peat. See MOSSWORTS. Revised by CHARLES E. BESSEY.

**Spheg'idæ** [Mod. Lat., named irregularly from *Sphex*, the typical genus, from Gr. σφήξ, σφῆγξ, wasp]: a family of hymenopterous insects, including the so-called sand-wasps and mud-wasps. See HYMENOPTERA.

**Sphenis'cidæ**: See PENGUIN.

**Sphen'odon**: See HATTERIA.

**Sphenoid Bone** [*sphenoid* is from Gr. σφην, wedge + suffix -oid, like]: a bone of the skull, situated in man at the anterior part of the base. It has been likened in shape to a bat with open wings. It consists of a body, four wings, two greater and two less, and the two pterygoid processes. The body is quadrilateral, and hollowed out into a mere shell. This body is conceived to represent the centrum of the third cephalic vertebra (constituting the posterior portion of the sphenoid), joined to the centrum of the second vertebra (the anterior portion). The two greater wings are the neurapophyses of the third vertebra, and the two lesser wings are neurapophyses of the second vertebra. The sphenoid is exceedingly complicated and irregular in its outlines. It is developed from ten centers. It is usually joined anteriorly in the adult to the two sphenoidal spongy bones (a pair of thin, curved irregular plates). Posteriorly, it becomes continuously united to the occipital bone. It articulates with all the bones of the skull and with five of those of the face.

**Sphere** [(readapted to Latin) < M. Eng. *sphere*, viâ O. Fr. from Lat. *sphæra* = Gr. σφαῖρα, ball, sphere]: a surface all of whose points are equally distant from a point within called the center. It may be generated by a semicircle revolving about its diameter as an axis. Any line from the center to a point of the surface is a *radius*, and any line drawn through the center and limited by the surface is a *diameter*; all radii of the same sphere are equal; also all diameters of the same sphere are equal. Every plane section of a sphere is a circle; if the plane passes through the center, the section is called a *great circle*; if it does not pass through the center, the section is called a *small circle*; the radius of a great circle is equal to that of the sphere; the radius of a small circle may have any value from the radius of the sphere to 0, in which case the cutting plane merges into a tangent plane. The surface of a sphere is equal to four great circles, or it is equal to the circumference of a great circle multiplied by its diameter. The surface of a zone, viz., the portion of surface included between two parallel planes, is equal to the circumference of a great circle multiplied by the altitude of the zone. The volume of a sphere is equal to its surface multiplied by one-third of its radius. The volume of a spherical sector is equal to the zone which forms its base multiplied by one-third of the radius of the sphere.

In analysis, the surface of a sphere is a surface of the second order, whose equation in rectangular Cartesian co-ordinates is of the form

$$(x - \alpha)^2 + (y - \beta)^2 + (z - \gamma)^2 = R^2,$$

in which  $\alpha$ ,  $\beta$ , and  $\gamma$  are the co-ordinates of the center, and  $R$  is the radius of the sphere. Revised by S. NEWCOMB.

**Spherical Trigonometry**: See TRIGONOMETRY.

**Sphe'roid** [from Gr. σφαῖρα, sphere + suffix -oid, like]: a surface generated by an ellipse revolving about one of its principal axes. If the ellipse revolves about its conjugate axis, it generates a surface resembling a flattened sphere called an *oblate* spheroid; if it revolves about its transverse axis, it generates an elongated surface called a *prolate* spheroid. The surface of the earth is very approximately an oblate spheroid.

**Spheroidal State**: See HEAT and LIQUIDS.

**Spherom'eter**: an instrument for measuring the radius of a sphere when only a portion of the spherical surface, as, for instance, a lens, is given. The usual form consists of a vertical screw turning in a socket, which is equidistant from three supporting legs with sharp steel points. Above the sockets the screw has a graduated circular head. The points of the legs are brought in contact with the spherical surface, and the screw is turned until its extremity also touches it. This process is repeated with a plane. Thus the distance between the center of the circle through the ends of the legs and its pole on the sphere is obtained, from which the radius of the sphere can be calculated. R. A. R.

**Sphincter** [Mod. Lat., from Gr. σφινκτηρ, anything which binds tight, deriv. of σφίγγω, compress, squeeze, bind tight]: in anatomy, a muscle the fibers of which, generally circular, surround some passage in the animal organism, closing the passage, in opposition to certain other muscles called dilators. Some of the sphincters are composed of striped fiber, some of unstriped, and some of both combined. The eyes, pupils,

mouth, nostril, vagina, bladder, and urethra are the most important passages which are provided with sphincters, but there are numerous other sets of circular fibres which have more or less of the nature of sphincter muscles.

**Sphingidæ** (a form) of insects including the hawk-moths, etc. (See *moth* and *lepidoptera*).

**Sphinx** (Lat. = Gr. σφίγξ, σφίγγειν) is a classical mythological and art-animal being, usually represented as having the head of a woman, the trunk, feet, and claws of a lion, the tail of a serpent, and the wings of a bird. It was also represented as having the fore part of a human body of a woman, the claws of a vulture and the wings of an eagle. It was reported to have originated in Egypt. In the latter point there may be an historical foundation, but as respects the features which were combined to form the Greek sphinx there are few traces of similarity with the Egyptian prototypes. The Egyptian sphinx proper is composed of the head of a man and the body, limbs, feet, and tail of a lion, but it was represented as the guardian of wings, except in the period when Greek influence had come to be felt, and its avian design is to be ascribed. In Egyptian mythology the sphinx was the guardian of temples and tombs the incarnation of Heliopolis. The face, however, was sculptured presumably to represent the reigning Pharaoh. It was the form assumed by the god Horus when exposed to their enemies, and it was supposed generally to be a quadruped of the desert. Since the discovery of the sphinx the human head is required in that of the lion (completing) or of the hawk (diversifying) but when applied to these composition the same subject is a composite, as they are merely variations in the forms given to the statues to whom these animals were assigned. The lion-headed figure and the tail sphinx, sometimes appearing more human, and for similar purposes as they appeared in the avian or sphinxes, which mark the passage from the Nile to the temple. Used thus they were supposed to ward off evil from the dwellings of the gods and of their sacred animals.

There are few, if any, specimens of this style of sculpture from the old Egyptian from the last dynasty there are none, and during the remainder of Egyptian history it was a favorite device. The so-called Hylæan sphinxes from Greece are of a different type from those found in other parts of Egypt, and also from some other examples found even in Egypt itself. Their bodies are shorter, more bulky and powerful, and the human heads are also of a different type, more high cheek-boned, broad brow, and powerful features. They are also adorned with manes and shaggy manes. Several theories have been advanced to account for the differences. It was at first supposed that they were genuine Hylæan creations, produced by foreign artists settled in Greece, but it is now held that the fact that the name of Apollon, the Hylæan, is merely scratched upon the shoulder, and does not occupy the place of honor—that it resembles a signature rather than an inscription. The main argument rests upon the fact that the Egyptian sphinx of faience shows a more pronounced nose, and it has been shown generally accepted. It has also been suggested that they are productions of a local Egyptian school of sculpture not under the direct control of Egyptian art. Never holds that they are remnants of an archaic race, which apparently carried one species head to Egypt, between the sixth and tenth dynasties, of which Klysia is the representative. (See *Paoli, History of Egypt*, i. p. 117 ff.) Golenischeff considers that they were monuments of Amneph III. of the twelfth dynasty (*Revue de l'Égypte*, 1881, 1882) to whom they bear a striking resemblance. The whole subject, however, is involved in much doubt.

The date of the oldest Sphinx of Gizeh, hewn about 2500 B. C. of the Great Pyramid, is absolutely unimportant in illustration in the article Egyptology. It has been assigned to prehistoric times, to the age of Thaps (Klysia), and Khafra of the fourth dynasty, and even to Thutmose IV., but of proof there is none. Fundamental to the whole discussion are two facts—the dated sphinxes of the twelfth dynasty can be proved, and the Egyptian sphinxes of the Old Kingdom do not contain the sphinx-chamæleons sign at all, as do those of later periods. The argument is a period antedating the fourth dynasty even upon an inscription found in a neighboring tomb, which purported to be from the fourth dynasty, but which was really composed in the twenty-first. It alleges that at the earlier date the sphinx was in need of repairs,

and internal evidence points to the probable assumption that the story is entirely mythical. The assignment to Khafra was based upon the fact that a statue of that king was found in the immediate neighborhood. The sphinx in the small temple, between the paws of the figure, was found a tablet of Thutmose IV., in which he is understood to record a dream in which he thought he saw the sphinx, and the sphinx was supposed to him and promised him long life and prosperity if he would clean the figure from the desert sand that had encrusted upon it, and repair it. The granting of age promises to grant a ruler, and the assignment of it to the time of the Heliopolitan dynasty (sixth and seventh) is only a guess which has something in its favor. It is certain that it was uncovered twice in ancient times, once under Thutmose IV. and once under Ramesses II., but little else is known. It is also known, from an inscription by Herodotus, though it finds place in other ancient writings. Its modern name it has been known as the Sphinx, Merodet, and Mepet. When uncovered it was found to be built out of the native rock the head having been carved with great care, but the body left comparatively rough. Folds or irregularities in the stone were patched with rough masonry, apparently of the Roman period. The whole figure facing eastward and is about 66 feet long. The top of the head is about 66 feet above the pavement between the paws. The paws are 40 feet long, the head 40 feet long and nearly 4 feet broad. The face was originally colored red, but all traces of the face have disappeared. It is supposed to have been covered in gold, at least, with a limestone covering. The face is much damaged and the nose and beard have disappeared. This damage was largely due to the fact that the Mammals used it for a target. The mouth is broad and pleasing, and the face has a human aspect. It is quite probable that it originally represented the face of the Pharaoh by whom it was cut.

Between the paws of the sphinx is a more plastic approach by a flight of steps and close to the breast is a small open temple, which is divided into two parts. The pillars form the roof, and on the eastern one was the statue of Thutmose IV., dated from his first year. Another temple is near at hand, which has the general appearance of a tomb or mastaba, and it has been supposed that the sphinx was regarded as the guardian of this building and its contents. (See *W. B. Smith*).

**Sphinx-entertainer**: See *Howe-sen*.

**Sphygmograph** (Gr. σφύγις, pulse, heart-beat & γραφία, writing) an instrument for measuring and recording the shape, frequency, and force of the blood-wave in arteries. It consists of a series of delicate levers set in motion by the pulse-beat, and of a tracing surface of paper, on which are recorded the results of the measurement. There are several forms of sphygmograph. They apply simply on the wrist and the momentary change in the caliber of the blood-vessel. Considerable skill is required in working with the sphygmograph. In diseased conditions of the heart its results have a diagnostic value. (Revised by W. PATER.)

**Spice** [M. Eng. *spice*, *specie*, from O. Fr. *spice*, *specie* > Fr. *épice*: Lat. *specia*, *species*, appearance, appearance, kind, water, goods, species; certain aromatic seeds, bark, roots, dried fruits, etc., used in cookery for their flavoring qualities, and in medicine as stimulants and carminatives. Such are cloves, ginger, allspice, nutmeg, pepper, mace, cinnamon, cinnamon, cassia, vanilla, etc. Besides these others, which are extensively exported from tropical countries, and especially from the East, there are others now much forgotten, such as aniseed, cardamom, nutmeg, nutmeg, nutmeg, and the so-called clove-bark. These have nearly all passed from general commerce—some because they are inferior in quality and others on account of their limited supply. Most of the spices are natives of the Old World, but a few are American, and nearly all the important ones are now generally naturalized throughout the tropical world.

**Spice Bush**: See *PERSEA BUSH*.

**Spice Islands**: See *MOLUCCAS*.

**Splachn**, or **Splachn**, See *SAARBRUCKEN*.

**Spider-crab**: See *CRAB*.

**Spiders** [M. Eng. *spider*, or *spider* > O. Eng. *spider* for *spider*, *spider*, *spider*, *spider*] an order of arachnid animals, the *Araneida*. The chief characters which distinguish them from other groups are the presence of a body divided into two regions, cephalothorax and abdomen,

both without distinct joints, and the latter, which is joined to the former by a slender stalk, bearing spinning manmilla on the hinder end. The cephalothorax bears four pairs of legs and two pairs of smaller appendages, the first of which

Orb web spider, *Epetra insularis*.

are the poison-jaws, while the second are curiously modified in the male for reproductive purposes. There are usually eight eyes (sometimes six or fewer) upon the front of the cephalothorax. Respiration is accomplished by lungs or lungs and tracheae. When lungs alone are present there are two pairs of these organs on the under side of the abdomen. In other forms there is a single pair of lungs, the other pair being replaced by air-tubes like those of true insects.

Spiders are carnivorous, and live upon other insects which they kill by the poison forced through the poison-jaws. They do not eat the prey, but merely suck its juices. Some spiders hunt their prey, jumping upon it like a miniature tiger, but the majority form webs of silken threads covered with a viscid substance. The shape and character of these webs varies exceedingly. In general it may be said that the spider has a lair where he can recognize any vibration of the web, and whence he can rush out to further entangle the prey. The web is secreted by glands inside the body, and as it comes in contact with the air in its passage through the spinning organs it hardens into the familiar thread, which in reality is a cable formed of a number of smaller fibers. Besides its use in forming webs the silk is employed in making nests, as a means of flying, and for the formation of cocoons to contain the eggs. "The males are smaller than the females, and their approaches to the latter are made with extreme caution, as they run the risk of being devoured; extending their pedipalps, they deposit the spermatophores in the female genital aperture and betake themselves to flight" (*Huxley*). In their habits spiders are among the most interesting of animals, well repaying observation. Besides the European works of Thorell and Simon, the student should consult papers by Emerton, *Trans. Connecticut Acad. Science* (1882-84); Peckham, *Trans. Wisconsin Acad. Science* (1888); and McCook, *American Spiders* (3 vols., Philadelphia, 1889-94). J. S. KINGSLEY.

**Spiegel, FRIEDRICH:** Orientalist; b. at Kitzingen, near Würzburg, Bavaria, July 11, 1820; studied Oriental languages at Erlangen, Leipzig, and Bonn 1838-42, and at Copenhagen and Oxford 1842-47, and in 1849 was appointed Professor of Oriental Languages at the University of Erlangen. Besides editions of various Persian works and grammars of the Old Persian and Old Bactrian languages, he published *Einleitung in die traditionellen Schriften der Parsen* (2 vols., Leipzig, 1856-60); *Die Altpersischen Keilschriften* (1862; 2d ed. 1881); *Eran, das Land zwischen Indus und Tigris* (1863); *Eranische Alterthumskunde* (3 vols., Leipzig, 1871-78); *Vergleichende Grammatik der alteranischen Sprachen* (1882); *Die arische Periode und ihre Zustände* (1887).

**Spiel'hagen, FRIEDRICH:** novelist; b. at Magdeburg, Germany, Feb. 24, 1829; studied jurisprudence, and afterward philosophy, philology, and literature at Berlin, Bonn, and Greifswald; taught for some time at the university at Leipzig, and finally devoted himself entirely to literary pursuits. In 1859 he removed from Leipzig to Hanover, where he became literary editor of the *Zeitung für Norddeutschland*; but in 1862 he took up his permanent residence in Berlin. Spielhagen has successfully aspired to treat the great questions of the day in a series of novels distinguished by their artistic composition, their elegant style, and their philosophic thought. The most important of these novels, many of which have passed through numerous editions, are *Problematische Naturen* (1860); *Durch Nacht zum Licht* (1861); *Die von Hohenstein* (1863); *In Reih und Glied* (1866); *Hammer und Amboss* (1869); *Sturmflut* (1877); *Quisiana* (1880); *Angela* (1881); *Was soll das werden* (1886); *Noblesse oblige* (1888); *Der neue Pharao* (1889). In his excellent book *Beiträge zur Theorie und Technik des Romans* (1883), Spiel-

hagen attempts to fix the æsthetic laws which govern the art of novel-writing, and in his autobiography, *Finder und Erfinder* (1890), he gives a charming account of the influences which conspired to make him a novel-writer. An edition of selected novels appeared in 1889-92, comprising twenty-three volumes. JULIUS GOEBEL.

**Spiers, ALEXANDER, Ph. D.:** lexicographer; b. at Gosport, England, in 1807; graduated at the Universities of Paris and Giessen; settled at Paris 1829; was Professor of English successively at the School of Commerce, at the School of Public Works (Ponts et Chaussées), at the Lycée Bonaparte (1833), and at the University of France; became inspector of colleges; received from Napoleon III. in 1869 the cross of the Legion of Honor in acknowledgment of the value of his series of English grammars, and especially of his standard French-English and English-French *Dictionary* (Paris and London, 2 vols., 1846-49), of which two editions appeared in the U. S.—one edited by G. P. Quackenbos (New York, 1852), the other by J. L. Jewett (1856). D. at Passy, near Paris, France, Aug. 26, 1869.

**Spike** [from Lat. *spi'ca*, point, spike, ear of corn, tuft or head of a plant]: in botany, a flower-cluster, of the centripetal or indeterminate order, in which sessile flowers are arranged along an axis. The spadix and ament are varieties of the spike. The ears of wheat and rye are familiar instances of the spike, which in some instances is compound—that is, contains many sessile spikelets. When the flowers are stalked instead of sessile, the spike becomes a raceme.

**Spikenard**, or **Nard** (*spikenard* is *spike* (see SPIKE) + *nard* < O. Eng. *nard*, from Lat. *nar'dus* = Gr. *νάρδος*; cf. Heb. *nêrd*, Pers. *nard*): (1) in the East the *Nardostachys jatamansi*, a valerianaceous plant of India. Its strong odor is disagreeable to most persons of European and American birth, but it is considered very precious in the East. Its medicinal properties are precisely those of valerian. (2) Roots of various species of valerian are exported from Europe to the Levant under the name of Frankish nard, Celtic nard, and mountain nard. Cretan nard is also the root of a valerian. These are much used in the East as substitutes for the true spikenard. (3) In England the fragrant oil of *Andropogon nardus*, an East Indian grass, is called oil of spikenard. It is used in perfumery. (4) In the U. S. the name spikenard is given to *Aralia racemosa*, and the *A. nudicaulis*, or false sarsaparilla, is called small spikenard. They have each a limited use in domestic medicine.

**Spike, Oil of:** the volatile oil of the *Lavandula spica*, the broad-leaf lavender of Europe. It has an odor much like that of oil of turpentine. It is used by artists in preparing their varnishes, and by veterinarians as a horse medicine. Much of the commercial oil of spike is an entirely factitious mixture, of which oil of turpentine is the basis.

**Spinach**, or **Spinage**: the *Spinacia oleracea*, a chenopodiaceous Old World herb, much cultivated in nearly all parts of the world as a potherb, especially for use in the spring. There are about twenty varieties grown in the U. S. Other plants of this and of other genera having similar uses are locally called by this name.

**Spinal Caries**, or **Potts's Disease of the Spine**: an inflammatory condition of the vertebrae, a spondylitis, destructive in its nature, usually tuberculous in character, and slow in its course. A slight injury is often sufficient to awaken the process in an individual predisposed to struma. Gradual disintegration of the bodies of one or more vertebrae takes place with subsequent bending, which produces a kyphosis or sharp projection backward. The early symptoms are colicky pains in the abdomen (often mistaken for indigestion), reflex pains in the limbs, and a peculiar rigidity of the back in walking and stooping. If the disease is situated in the cervical or upper dorsal regions, an irritative cough is often among the earliest symptoms.

The name Potts's disease was given to this affection from the fact that Dr. Percival Potts, in 1779, was the first physician to describe accurately this special condition of the bones which gives rise to the hunch-back deformity. That this disease existed in prehistoric times is evidenced by the specimens in the Peabody Museum at Cambridge, Mass.

The treatment consists in keeping the diseased bones perfectly at rest until nature throws a bony bridge across the diseased gap and ankyloses the spine. This result may be accomplished by placing the patient continuously in the recumbent posture, or by the application of a steel support, a hard leather or rigid jacket, plaster-of-Paris splint, or other

flexion. The disease is unusually long and tedious, its course often extending over many years. Abscesses frequently form in the neck or groin more commonly in the latter situation. The latter condition is known as psoas abscess, from the fact that the psoas follows the sheath of the psoas muscle. When the psoas makes exit in the back, the process constitutes a lumbar abscess.

Palsy of the lower limbs occasionally results, which though tedious is usually curable, provided extension and fixation are rapidly effected. Immobilizing is rarely required. See CLARK.

Dr. FOSTER WILLIAMS.

**Spinal Column** (*columna* is from lat. *columna*, dor., of *columna*, back-bone, liver,

FIG. 1.—Normal spine.

FIG. 2.—A vertebra.

**Spinal spine.** So called from the shape of a vertebra; the back bone, the composite bony column of the back of vertebrate animals which affords attachment, direct or indirect, for the ribs and other bony parts, and for the numerous groups of voluntary muscles. In man it is a flexible column of thirty-three vertebrae united by ligaments, with interposed cartilaginous intervertebrae. The column is from 2 to 2½ feet in length, and curved laterally presents marked curves, which add to the grace and free movements of the trunk. (Fig. 1.) The column is divided into regions—the cervical, thoracic, lumbar, and pelvic—corresponding to the neck, chest, abdomen and pelvis. The vertebrae occupying the pelvic region, unite freely and flex both anteroposteriorly and laterally. A single vertebra (Fig. 2) consists of the body, which unites it to other vertebrae, and a bony ring which encloses the vertebral foramen or vertebral canal, protecting the spinal cord; this ring has articular and spinous processes for attachment of ribs, ligaments, and muscles.

Revised by W. PIERCE.

**Spinal Cord:** See MEDULLA SPINALIS.

**Spinal Curvature.** Three kinds: (1) rachitic curvature; (2) lateral curvature; (3) angular curvature. The curvature of rachitis (rachitis) is usually a simple exaggeration of the normal curve of the spine—convexity at lumbosacral in the dorsal and convexity or humpness in the lumbar region; occasionally there is a lateral bending scoliosis, but unaccompanied with the rotation of true lateral curvature. Lateral curvature is a deviation of the spinal column at one or several points from the position which it occupies in health in the sagittal line of the back, accompanied by marked rotation of the bodies of the vertebrae around the axis of the spinal column, which is thus much more distorted in front than behind. It occurs in children, in young, imperfectly developed, feeble, and growing adults, more especially women, and less often in men. The spine normally occupies the middle of the back, with a slight convexity to the right in the dorsal region; in this central position it is acted upon by many forces—the weight of the head and trunk, the lateral traction of the arms in all physical efforts, of the thoracic and abdominal muscles in breathing—and beneath the divided support of the two lower extremities through the interconnection of the pelvis. A lateral curvature may develop unconnected with any one of these forces, when the bony mass, poorly conditioned, the spine may yield to the weight it supports. Habitual use of one arm to the exclusion of the other may cause deviation of the spine, especially in the thoracic arch—a common occurrence in weakly children at school. Scoliosis and in some cases a combined mechanical scoliosis. Deviation of one lung, as phthisis, chronic pulmonary pneumonia, tuberculosis and emphysema, by diminishing respiratory movement on one side, often causes distal curvature to the non-diseased side. Shortening of one limb, any joint disease, persistent limping from any cause, by tilt-

ing the pelvis through the spine out of center and developing lumbar curvature. Whenever a curvature is thus primarily established, a secondary curvature develops at another part of the vertebral column, and on the opposite side, and thus the erect position of the body is maintained. The affected spine, curved anteriorly or posteriorly, presents a double curvature, a *kyphosis* line whose upper and lower ends can be connected by a vertical straight line, representing the component of all the forces, weight, also, which the spine sustains. Occasionally there are four curves, two in the dorsal and two in the lumbar region.

Lateral curvature, if of long standing, may so modify the size and configuration of the lung, so change the position and structure of the intervertebral cartilages and the mutual volume of the two sides of the body, that cure is impossible or incomplete. More often it is curable by correcting bad habits, as favoring one side in standing, sitting, or sleeping, by resort to light gymnastics and special posture movements, and by the use of apparatus which removes weight from the spine and applies pressure or traction to counteract the curves. Great advantage may, in early cases, be derived from dividing the period during which the body is erect, by lying flat on the back, without a pillow and on a hard mattress for at least an hour in the mid part of the day. (Hemmer's) iron treatment, cod-liver oil, and phosphates, out-of-door life, warm clothing, stimulating baths, and regulated diet are indicated in all cases.

Angular curvature, or *Scoliosis* (*kyphosis* is *kyphosis*), is of more serious nature. It may be followed by paralysis of the lower extremities, due to pressure on or inflammation of the spinal cord, but paralysis and atrophy do not usually result in the same cases.

**Spinal Diseases:** See MEDICINE and SURGERY (Cervical, Thoracic).

**Spindler, KARL:** novelist, b. at Breslau, Prussia, Sept. 16, 1796; educated at Strassburg, afterward at Aachen; was connected for some time with a company of strolling actors; published in 1824 his first novel, *König von Kroatien* (2 vols.); chose literature for his occupation; lived at Hanau, Stuttgart, Munich, and finally at Baden-Baden. D. at Badenbad, Baden, July 12, 1866. The best of his novels are *Der Kaiser* (4 vols., 1827), *Der Jude* (2 vols., 1827), *Der Jesuit* (3 vols., 1829), and especially *Der Israelit* (1834). The latter story is an excellent specimen of the early historical novel in Germany, giving a picture of the French Revolution and the subsequent fall of Napoleon which has not yet been surpassed in fiction. Many of his minor novels were published in a periodical, *Erzählungsarchiv*, which he edited after 1831. A collected edition of his works appeared in 102 vols. at Stuttgart from 1841 to 1854.

Revised by J. J. GIBSON.

**Spindle-tree, Staff-tree, or Bittersweet Family:** the *Celastraceae*; a small family containing 900 species of dioecious, shrubby plants, most of which are shrubs and trees. The perianth is 4- to 5-merous, and the compound umbels usually three to five, called with two or three in each cell. The species are widely distributed in temperate and tropical climates, eighteen of which occur in North America. The shining bittersweet, *Euonymus alatus*, is one of the prettiest woody climbers of the U. S., especially in the winter, when its red, waxy seeds remain long in conspicuous clusters. The genus *Euonymus* includes the spindle-tree proper, *E. alatus*; *Euonymus* is the ornamental shrub known in the U. S. as the wax-tree, or burning bush. CHARLES E. GIBSON.

**Spinel:** See SPINEL CRYSTAL.

**Spinel** (Fr. *spinel*): a mineral, essentially a compound of aluminum and magnesium, but with variations and admixtures that give rise to a great variety of colors and tints. It crystallizes in regular octahedral forms, sometimes of large size in the black and opaque kinds. The transparent spinels make beautiful gems, especially the deep-red, clear-red and vermilion-colored stones, which are known as ruby spinels and command high prices, from one-eighth to one-half that of diamonds, the finest having often been erroneously sold for true rubies. The pink variety is known as hyacinth or rubine, the blue, sapphire spinel, the green, chrysomel, the purple, amethyst spinel. There are also blue, green, yellow, and purple, and even white. The so-called black Prince's ruby in the English crown is a spinel. The best spinel gems are from Ceylon, Burma, and India. (H. P. LANE.)

**Spindle di Luna Spinelli**, called SPINELLI American painter; b. at Arezzo, Italy, about 1580. He was the pupil of

Jacopo di Casentino, and at the age of twenty surpassed his master. It is supposed that in 1347 he was assisting his master to decorate the Church of Santa Maria Novella in Florence with frescoes representing the Virgin and St. Anthony. Of these little remains. Some scenes from the life of St. Benedict, by Spinello, at San Miniato, near Florence, are still in good preservation. These were painted in 1384, when Spinello took refuge in Florence after the sack of Arezzo. Before this date he had decorated many churches in his native city; in San Francesco an *Annunciation* still exists in the chapel of St. Michael. He painted a fantastic composition of the archangel driving Lucifer from heaven, a fragment of which fresco is in the National Gallery, London. This composition was afterward repeated by him for the guild of St. Angelo. In 1361 Spinello painted a panel for the abbey of the Camaldolesi, in the Casentino. The side-frescoes for the altar of Monte Oliveto Maggiore of Chiusi are to be seen in the Ramboux collection at Cologne. In 1387 Spinello was invited to Pisa to work in the Campo Santo there, and painted pictures considered his masterpieces, but now nearly destroyed. He left Pisa on account of political disturbances, and after a year in Florence he returned to Arezzo about 1394. Here he worked, decorating many churches with frescoes till 1405, when he went with his son and assistant, Parri, to Sienna, to paint the series of frescoes still preserved in the town-hall of that city. The last that is heard of him in Sienna is in 1408, after which he returned to his birthplace, where he died in Mar., 1410. For further information, see Vasari (*Le Monneer*), vol. ii., and Kugler's *Handbook* (1887).

**Spinnet:** a musical instrument, stringed and provided with a keyboard; one of the forerunners of the piano, but much weaker, and entirely out of fashion.

**Spinner,** FRANCIS ELIAS; financier; b. at German Flats (now Mohawk), Herkimer co., N. Y., Jan. 21, 1802; son of a German clergyman; was successively apprentice to a confectioner at Albany and to a saddle and harness maker at Amsterdam, N. Y.; became in 1824 a merchant at Herkimer; was deputy sheriff of Herkimer County 1829-34, and sheriff 1835-37; served in the militia and became major-general; was for twenty years connected with a bank at Mohawk, N. Y., and became its president; was auditor and deputy naval officer of the port of New York 1845-49; Democratic member of the Thirty-fourth Congress 1855-57; was an original member of the Republican party, and re-elected by it to Congress by 9,000 majority in 1856, and again by a similar majority in 1858; was chairman of the committee on accounts 1859-61; was appointed by President Lincoln, on the recommendation of Secretary Chase, to the post of treasurer of the U. S. Mar., 1861; and held the office until July, 1875. During this period his name was a synonym for official integrity, and his curious signature on the "greenbacks" became more familiar in the U. S. than the autograph of any other living man. He was defeated in 1875 as Republican candidate for comptroller of the State of New York. D. at Jacksonville, Fla., Dec. 31, 1890.

**Spinning:** the art of producing from vegetable or animal fibers an even and compact thread suitable for sewing or weaving. It is one of the most ancient of industries, and is still practiced in many parts of the globe by the spindle and distaff in the same manner that the process is pictured on Egyptian monuments. The distaff, held in the left hand, was a simple stick around which the fiber was loosely coiled; the spindle was a species of top which was set in motion by a twirl of the hand, and by combining its rotary motion with a gradual movement away from the spinner, who equalized the size of the fiber by passing it between the finger and thumb of the right hand until the motion of the spindle was exhausted, when the thread was wound around it, and the process was repeated. The first and most obvious improvement consisted in placing the spindle in a frame and making it revolve by mechanical action of the hand or foot in connection with a wheel and treadle. This constituted the spinning-wheel, which, notwithstanding its simplicity, can not be traced further back than 1530. Modern invention has added little to this implement, the chief improvement being a bobbin for winding the yarn by a motion separate from that of the spindle. See COTTON MANUFACTURES.

**Spinning-jenny:** the earliest form of spinning-machine in which more than one thread was spun at a time. Cotton, in the course of manufacture, is reduced from the state of the fleecy roll called carding into the state of spun thread by repeated though similar operations. The first

draws out the carding and gives it a very slight twist, so as to make it into a loose thread about the thickness of a candle-wick, in which state it is called a roving or slubbin. The subsequent processes draw out the roving much finer, and

The spinning-jenny.

at length reduce it into yarn. The spinning-jenny, invented about 1764 by JAMES HARGREAVES (q. v.), was not, like Arkwright's spinning-frame (1769), capable of being applied to the preparation of the roving itself. In 1779 Samuel Crompton completed his invention of the mule, which combined in one machine the principles of both the jenny and the frame, and by which the jenny was ultimately superseded. See COTTON MANUFACTURES.

The person operating the jenny turned the wheel with the right hand and with the left drew out from the slubbin-box the rovings, which were twisted by the turn of the wheel. Next a piece of wood, lifted up by the toe, let down a wire, which so pressed out the threads that they wound regularly upon bobbins placed in the spindles. The number of spindles in the jenny was at first eight; when the patent was obtained it was sixteen. It soon came to be twenty or thirty, and as many as 120 have been used. The introduction of the spinning-jenny met with great opposition. In 1779 a mob destroyed the jennies for several miles around Blackburn, and with them all the carding-engines, spinning-frames, and every machine turned by water or horses. The spinning industry was driven from Blackburn to Manchester and other places. Nevertheless, the jenny and the frame revolutionized the cotton manufacture. WILLIAM KENT.

**Spínola,** AMBROSIO, Marquis de; soldier in the service of Spain; b. in Genoa, Italy, about 1571, son of a wealthy Levant merchant and of a princess of Salerno; took service at an early age under his brother, an admiral in the Spanish navy; participated in the war against the Dutch and English 1588; raised and equipped at his own expense in Spain a numerous corps of veterans, at whose head he proceeded to the Spanish Netherlands 1602; was instrumental in rescuing the Archduke Albert from the superior forces of Prince Maurice of Nassau; became chief commander of the Spanish armies in Flanders 1603; and in the fall of that year took command of the forces around Ostend, which had been besieged for two years. The city capitulated in Sept., 1604. He conducted the war with great ability, but varying success, until the truce of twelve years (1609), which he favored; commanded in the interval the Spanish forces in Germany; took Aix-la-Chapelle, Wesel, and Jülich 1622; was repulsed from Bergen-op-Zoom 1623; captured Breda after a protracted siege 1625; was subsequently commander of the Spanish army in Italy, and captured the city of Casale, Piedmont, but died while pressing the siege of the citadel, Sept. 25, 1630. His death is said to have been hastened by his chagrin at the ingratitude of the Spanish Government in disregarding his pecuniary claims.

**Spinoylic Acid:** See SALICYLIC ACID.

**Spino'za,** (BARUCH) BENEDICT; philosopher; b. at Amsterdam, Holland, Nov. 24, 1632; a member of the Spanish-Portuguese Jewish community at that place, then the chief seat of European Judaism. His father, who was a trader, noticing the extraordinary faculties of the son, gave him a good education. Accordingly, he entered upon the customary path of a Jewish scholar, passing through all the steps of the ordinary rabbinistic school, from the elements of He-

known to the holy writings of the Old Testament, chosen to the Talmud the Jewish commentators, and the scholastic writers of the Middle Ages. Jewish literature led him, through the literature of the scholastics, wherein the Galilean doctrine played so prominent a part, gradually to the portals of the then developing modern views of the subject of the universe. In short, he rather Spinoza became a student of the school of the Jesuits, the school of the Jesuits, had become a scholar before him. In short, however, he obtained no full back upon Christianity for salvation from Spinoza. The Spinoza could not do, but those from Judaism could on perhaps truthfully to appeal to it that he did not feel any way inclined to accept Christianity, no way not without any support or guidance. The Jewish God, as the cause and creator of the universe, he had dismissed, the idea of conception of God, as the moral hierarchy and order of the universe, was utterly repugnant to his originally Jewish mind, and thus he had no other recourse than the essential pantheism of substantiality. This explains with Jewish clarity brought about a dispute between him and his rationalist teachers, which finally led to his expulsion from the synagogue at Amsterdam July, 1656. Spinoza wrote a protest against the anathema pronounced against him, but otherwise paid little attention to it. He simply changed his name from *Baruch* to *Benedict* Spinoza, by which last name he is generally known, and when he discovered that he was still persecuted by the orthodox Jews and orthodox Christians of Amsterdam, he retired to the country-house of a friend in the vicinity of Amsterdam, a member of one of the persecuted sects of the Netherlands of that time, with whom he lived in deep isolation from 1660 to 1663. He subsequently accompanied him to Rensberg, where he remained till 1664, in May of which year he returned to Voorburg, where he remained in the house of the painter Tyllman till 1669. He then, at the request of his friends, removed in 1671 to Scheveningen near The Hague, where he remained till his death on Feb. 21, 1677. His personal appearance Spinoza was of middle height, his features were regular and well formed, complexion dark, hair curly and black, long black eyebrows, and, as he wrote himself, "with somewhat of the Spanish and the French." As such his forehead he learned to grip upward glasses, and also the art of painting. His modest life was throughout extremely frugal and secluded. His work was unbroken.

The ground of the extraordinary interest taken in Spinoza is to be found in the pantheistic view of the universe which he has carried out in the simplest of actual terms in his *Ethics*. Hence none of the other works of Spinoza have special value. Interesting as they may be in connection with the *Ethics*, they have no intrinsic merit of their own. All the two published major works, as well as his individual correspondence, have their central point in the *Ethics*. Students of Spinoza are here referred, first, to the summary of the *Ethics* concerning Spinoza's philosophical system, second, to the remarks of G. E. Lessing, and, in our estimation third, to the essays of Jacobus de Spinoza and Lessing. Both the works are also full of references to Spinoza. Spinoza's view of the universe may be very concisely described as follows: Adopting the category of substantiality, he altogether abandoned the Jewish conception of a free Cause or self-conscious Jehovah calling the world into existence by his mere word, and adopted in its place the essential notion of an atomistic substance of the universe as a whole, of which all the separate phenomena of just substances, human, earth, mineral, animals, plants, and minerals, were but so many attributes. In his scheme there are therefore no God, no Freedom, no Immortality. A free Cause means the word "God," it is to be interpreted as equivalent to the word "nature" or "universal substance," when he uses the word "freedom," it is to be interpreted as the equivalent of "necessity"; and his conception of the word "immortality" means simply that the nature itself, after death of the body, will merge again into the infinite substance, wherein no self-consciousness can possibly exist. His God, is therefore no God, in the ordinary conception of the term; his freedom, no freedom; his immortality, the very essence of what men mean when they say death is being immortal.

To understand thoroughly the style of the *Ethics*, it must always be kept in mind that Spinoza was a Jew, and that the Jewish tendency of mind betrays itself not only in the subject matter under discussion, but also and equally in its mode of statement. The style of all Jewish writers is

always, disregarding transition, and to my mind exceedingly paradoxical, as every chapter of the *Ethics* shows. This explains, although seemingly in a paradoxical way, why Spinoza claims that he calls this "geometrical or mathematical" method for his chief work. The opening sentences are as follows: "The opening propositions of *Ethics* the first does not involve the second, nor the second the first, etc.; and none are proven, nor to them any attempt to the whole back to prove any of them." Hence the very fundamental principles of philosophy, around which revolve these many disputes, are at the beginning of the work laid down in axioms, and what is equally objectionable at the beginning of each new part of the *Ethics*, of which there are four parts, new axioms are introduced in the same arbitrary abrupt manner. Thus the word *freedom* had no significance to him in its current meaning is absolutely alien from the foregoing axioms that occur in his *Ethics*, wherein he is usually a little more conspicuous than in his very paradoxical and polished works. Taking the example of a stone thrown by water, and hence impeded by an external cause: "Now conceive, together, that the stone as it proceeds in the motion knows and knows that it is moving, so far as it is able, to continue in motion; then, inasmuch as it is conscious only of its motion, and in motion itself, it will believe itself to be most free, and to preserve its motion from any other cause than that it will to do so. And this is precisely that *freedom* of which all men boast themselves possessed, but which consists in their belief that men are conscious of their *freedom* and *freedom* of the cause by which they are determined." To remove the last objection that we might be free at least in thinking, Spinoza adds: "You present, however, affirm: 'that we can use our reason with perfect freedom.' . . . 'What, however, is not out a contradiction of his proper consciousness, can deny that he is free to think his thoughts, to write what he pleases, or to leave writing alone.' . . . I, for my part, and that I may not contradict my consciousness—then, he that I may and undertake reason and experience, and yield to ignorance and prejudice—deny that I possess any absolute power of thinking, and that at pleasure I can will, or not will, to do thus or thus—to write, for example.' The same criticism applies to his doctrine of immortality. There are numerous Latin and German editions of the *Ethics*, and of most of the other of Spinoza's works. English translations and expositions of his works are as follows: *Benedict de Spinoza, his Life, Correspondence, and Ethics* by H. Wallis, M. D. (London, 1870); *The Ethics of Benedict de Spinoza* (London, New York, 1876); *Spinoza, his Life and Philosophy*, by Frederick Pollock (London, 1879); *A Study of Spinoza*, by James Martineau (London, 1882); *The Chief Works of Benedict de Spinoza* (2 vols., Bohn's Library, London, 1883); *Ethics*, translated by W. H. White and Amelia H. Stirling (1884). It includes all his correspondence, a very valuable feature. In Germany, Kurt Fischer's *Einleitung in Spinozas Philosophie* (vol. 1, part 2) is devoted entirely to Spinoza and his philosophy, and is the most satisfactory work extant on this subject.

Revised by W. T. HARRIS.

**Spina** (Mod. Lat. from Lat. *spina* = Gr. *σπίνα*, mean lowest sort of *arisa*, and, spine. So called from the shape of its foliage): a genus of herbs and shrubs of the family *Rumicaceae*, including numerous species, such as hard-hack (*S. nemoralis*), quince of the prairie (*S. latifolia*), and several other American, besides numerous Old World species, many of them very fine in garden culture. Some species of *Aspidos* (family *Sedifragaceae*), having somewhat the aspect of *Spina*, are cultivated under this name, incorrectly bestowed.

Revised by CHARLES E. DUNN.

**Spiral** (from Lat. *spira* or *spira*, deriv. of *spira* = Gr. *σπίρα*, and, *spira*): a curve that may be generated by a point moving along a straight line in accordance with a fixed law, while the line revolves uniformly about one of its points, always remaining in the same plane. The position generated during one revolution of the line is called a *spira*, the fixed point is the *pole*, and the distance from the pole to any point of the curve is the *radius-vector*. If we take any position of the revolving line as the initial position, and denote the angle through which the line has revolved by  $\theta$ , and the corresponding value of the radius-vector by  $r$ , the equation of any spiral may be written  $r = f(\theta)$ . The most interesting spirals are the spiral of Archimedes and the hyperbolic spiral. The former is determined by the law that the radius vector increases uniformly as it revolves so that the successive spirals intersect it at equidistant points along its length.

In the logarithmic spiral the logarithm of the radius-vector increases uniformly, and the radius-vector itself increases by a constant ratio for every equal increment of the angle of revolution. Thus the distances of the points of intersection from the pole form a geometric progression. At every point of this curve the tangent makes a constant angle with the radius-vector. On the inner side the curve continually approaches the pole, which it only reaches after an infinite number of convolutions. The *KRUMB* (q. v.) is a similar curve on the surface of a sphere. Revised by S. NEWCOMB.

**Spiral Ducts or Spiral Vessels:** See HISTOLOGY, VEGETABLE.

**Spirants** [from Lat. *spīrāns*, partic. of *spīrāre*, to breathe]: in phonetics, a class of consonants produced by a friction of the current of breath against the walls of the narrowed organs of the mouth. They are also called fricatives (Germ. *Reibelaute*, *Dauerlaute*, *Schleifer*). Such are *s*, *z*, *sh*, *zh*, *f*, *v*, *p*, *ð*, *ch* (in Germ. *ich*, *ach*), *j*, and to some extent *r* and *l*. They are distinguished from explosives or stops, *p*, *t*, *k*, etc., by being continuous and not momentary. See CONSONANT.

BENJ. IDE WHEELER.

**Spire, or Spires:** English name of SPEYER (q. v.).

**Spirillum:** See BACTERIOLOGY.

**Spirit-duck:** a common North American duck (*Charitonetta albeola*). The male has the head very puffy and iridescent, hence the name buffhead. It is an expert diver.

**Spiritism:** See ANIMISM and RELIGION, COMPARATIVE.

**Spirit-level:** See LEVELS AND LEVELING and HYPSONETRY.

**Spirit-plant:** the HOLY GHOST FLOWER (q. v.).

**Spirit-rapping:** See SPIRITUALISM.

**Spiritualism** [from Late Lat. *spirituālis*, spiritual, of a spirit, deriv. of Lat. *spīritus*, breath, life, spirit, soul (in Late Lat.) ghost, deriv. of *spīrāre*, breathe]: the creed of those who believe in the communication of the spirits of the dead with the living, usually through the agency of peculiarly constituted persons called mediums, and also in certain physical phenomena, transcending ordinary natural laws, believed to accompany frequently such spiritual communication, and attributed either to the direct action of spirits, or to some force developed by the medium's own personality.

**Revival of Spiritualism.**—The elements of the spiritualistic creed are not in themselves new, but are traceable severally to a high antiquity among different races and in widely separated localities, and have usually been associated with some form of religion; they have been revived, though not of conscious purpose, and gathered into one body of beliefs by a movement having its origin as the result of certain incidents which took place at Hydesville, a small town in the State of New York, in 1848.

In March of that year rapping sounds were heard, apparently proceeding from the furniture, walls, and ceilings, of a house in Hydesville, belonging to a family of German descent named originally Voss, a name anglicized into Fox. It was found that these sounds were always perceived in the presence of one or both of the young daughters of Mr. Fox, and that a code of communication could be established by which conversation was carried on with the intelligence supposed to produce them. It was said that in this way evidence was obtained concerning a murder believed to have been committed in the house some time before, and the sounds purported to come from the spirit of the murdered man. Many years after, in 1888, Mrs. Kane (Margaretta Fox) came before the public with a confession that she and her sister had made the sounds with their toes; but before her death she repudiated this confession.

**Noted Mediums.**—The reported phenomena at the time excited widespread attention in the U. S. and led to the formation of numerous circles of experimenters, where rappings of a similar kind were produced, and supposed communication with the spirits of the dead was established. To the spirit-rappings were added other phenomena, such as table-turning, automatic writing, trance-speaking, etc.; and the persons who developed them received the name of mediums. Mediums, according to the spiritualistic view, are endowed with a special faculty enabling them to be the agents of the communications and other manifestations of spirits. Some show evidence of this gift in early youth, and others gradually develop it in later years. The first medium, after the Fox sisters, was Andrew Jackson Davis, who attracted notice in 1845 as a clairvoyant and later as a trance-

speaker. Judge Edmonds, a well-known lawyer of New York, may also be mentioned; he began an investigation of the subject, became convinced that he was himself in communication with spirits, and wrote an elaborate work on spiritualism. Mrs. Hayden, another native of the U. S., went to England in 1852, and her sésances there started the spiritualistic movement which eventually spread over all Europe. In 1855 the celebrated Daniel D. Home also went to England, and later to the Continent. With Home spiritualism reached its highest development, and private and professional sésances were established in almost every European town.

Home overshadowed all contemporary mediums, and gained adherents to spiritualism from every intellectual and social class. He was, according to numerous witnesses, equally successful in receiving spiritual communications and in producing physical phenomena, which were witnessed and often severely tested by competent observers. Notable experiments in testing Home's powers were made by William Crookes, by means of apparatus of his own construction, with successful results.

Some years later Slade, and also Eglinton, attracted much attention in Europe by their so-called psychography, or spirit-writing (usually produced on slates), which led to interminable discussion in the press occupied with such matters. The spiritualists attributed this psychography to the spirits, and the non-spiritualists asserted it to be due to conjuring. Slade also gave sésances for a variety of spiritualistic phenomena, and achieved special notoriety from a series of sittings with Prof. Zöllner, of Leipzig, who, in *Transcendental Physics*, recorded his belief that the phenomena he had witnessed were due to intelligent "fourth-dimensional" beings.

One of the most noted mediums in England was the Rev. William Stainton Moses, who died in 1892. A full account of his experiences has been published in the *Proceedings* of the Society for Psychical Research. He claimed to receive communications from spirits, both of those recently departed and of personages belonging to remote generations. The list of his physical phenomena, according to his own account and the evidence recorded by the witnesses at his sésances, comprised most of those produced by Home and other manifestations as remarkable. Mr. Moses was for several years editor of *Light*, a London spiritualistic periodical, and was, besides, a busy clergyman and school-master of high reputation, and in no sense a professional medium.

In 1892 a series of sittings under unusually stringent if not perfect conditions was held by a committee of Italian savants, among others Schiaparelli, director of the Observatory of Milan, Profs. Gerosa and Brofferio, with a Neapolitan medium, Madame Eusapia Palladino, with the result that several of this committee were convinced of the supernatural character of the phenomena observed, while the others, if not quite convinced, were unable to offer any satisfactory explanation of what they had seen. The phenomena consisted in alterations in the weight of the medium, raps, moving of furniture, and materialization of hands. The sésances of Madame Palladino have attracted much attention in Italy, and are remarkable for having influenced the thought of numerous persons of high intellectual standing.

**Spiritual Communications.**—Spiritualistic communications or messages are received through the automatic writing with pencil or planchette, or trance-speaking of the medium when under spirit-control; by direct writing of the spirits on paper or slates with pencil or chalk; by precipitated writing—that is, writing supposed to be produced on paper without visible means; by table-turning, either with or without contact of the medium, and interpreted by a conventional code; and by raps on the furniture or walls of a room, made intelligible by a code as in table-turning. These communications are supposed to have two objects—one is to convey proof of the survival of the dead, the other to instruct in moral and philosophical knowledge. They are acknowledged by spiritualists to vary greatly in character and in value. Some are merely the expression of the ideas and opinions of the medium himself or of the sitters; some are trivial or false, and are attributed to a low order of mischievous spirits; others, however, it is asserted, are genuine and imply a knowledge of events or of facts beyond the range of the medium or of the inquirers, and proving their supernatural origin.

**Physical Phenomena.**—The principal so-called physical phenomena of spiritualism are lights, musical sounds, as of

incredible instruments played on or playing of real instruments by an individual individualized bodies, meeting of furniture and other heavy objects, the passage of matter through matter, the bringing down or other material objects into closed circles, materializations of hands or other parts of the body, or of complete human figures, spirit photography, and, finally, phenomena immediately affecting the medium, such as levitation or floating in the air without visible support, the disappearance of the limbs of his body, and the tests, when the automatic hand or feet cease and give place to others to handle without injury, phenomena for which there was especially room.

The origin of these phenomena is ascribed by spiritualists to the liberation of the gentleness of the communication, and this has to spiritualists looked much the same reason that induced it to revealed religion. Phenomena of alleged character, then the corresponding communication, are attributed to the lower orders of spiritual beings. All these phenomena do not occur at all times or with all mediums, and the latter are often classified according to the predominant character of their special "development." Thus there are writing mediums, trance mediums, materializing mediums, etc. A list, such as Home and Stainton-Morgan, has been equally successful in every variety of manifestation.

*Non-spiritualistic Evidence for "Phenomena."—*Count Gaspari de Gaspari carried out an elaborate series of experiments in moving tables without contact, a full account of which he published under the title *Des Tables Tournantes*. His team consisted of himself and his family and a few selected witnesses whom he admitted to his seances. The experiments were made in full light, the members of the party joining hands and concentrating their will upon the objects to be moved, a condition considered by de Gaspari to be essential to success. He Gaspari stated the aim of the independent of spirits in the movements he describes, and accounted them to a mental force capable of acting upon matter without the agency of muscular action. *Des Tables Tournantes* is a book of evidence very carefully recorded, and deserves attentive consideration in connection with the study of those chaotic and disputed phenomena. Prof. Barret and others have also placed on record experiments in various phenomena usually called spiritualistic, but on them some not produced in the presence of professional mediums, when, too, the hypothesis of fraud seemed to be a difficult one.

*Phases of Apparitions and Materialized Spirits.—*A special belief is that of Allan Kardec, who asserts that the human personality consists of the body, the soul or spirit, and a spiritual body ("perisprit") of a rarefied material, and that after death the spirit can manifest itself to the senses through the perisprit, which by some force of the will or through the agency of the medium becomes visible like superconcentrated matter within atmospheric conditions.

Another theory of the materialization of spirits is that the spirit draws from the medium certain emanations by which it can make itself wholly or in part visible in a temporary materialization of the medium's body. While materialized the spirit remains in close rapport with the medium, and at the end of the séance or on any sudden disturbance communication takes place—that is, the materialized body at once withdraws into the organism of the medium.

*Evidence of Fraud.—*Spiritualists acknowledge that many exposures of fraud in mediums have been made. They assert, however, that such fraud is to be expected occasionally in professional mediums, since their living depends upon the production of phenomena and the necessary power is very uncertain. They also say that the trickery is generally of a rather simple kind, and that the genuine phenomena are unmistakable and not to be so exposed and that therefore occasional trickery does not necessarily prove anything but faith on the part of a medium.

Spiritualists further contend that numerous exposures have been only apparent, and that much injustice has been done. "The view is founded on the theory of representation, namely, that the materialized form when disturbed disappears, thus leaving the medium in the exposure's grasp and creating the impression that the medium has himself impersonated the spirit-form."

*Relation of Spiritualism to Religion.—*Spiritualism is not an independent religion, but its manifestations are regarded by spiritualists as corroborating those official teachings of a God in which all the sects of the Christian religion substantially agree. It does not modify in any specific man-

ner the commands or dogmas of Christian sects, and among spiritualists are to be found persons of every shade of belief from Roman Catholicism to Unitarianism. To this general statement an important exception may be made. There is in France a large class of spiritualists who believe that the existence of the soul is one of absolute certainty and immortality.

The main points of spiritualistic belief, then, well together suggest that it doubt the character of religious and modern change, but retains the hopes of the future and thoughts of the earthly life; that the soul enters upon a continual steady progress toward immortality, that there are in the other life occupations and interests as in this world; that all work together for the attainment of the perfect life; and that happiness depends upon the degree of moral advancement.

In 1891 there were 364 spiritualistic organizations in the U. S., with 45,000 members.

THOMAS C. FULTON.

*Spirochaeta*: See BACTERIOLOGY.

*Spirula* (Mod. Lat., dimin. of Lat. *spira*, coil): a genus of two-armed elutriate cephalopods, of which there are three species, found in most warm seas. They constitute a family, *Spirulidae*, which has interesting relations to the molluscs and the ammonites. The extremely delicate, narrow, chambered shell is especially common on the New Zealand shores, but the animal itself is very rarely seen in a perfect condition. Revised by D. S. JOHNSON.

*Spithead*: a headland off Portsmouth, England, being the eastern portion of the sea-channel separating the Isle of Wight from the English mainland. (See Portsmouth.) Its security as an anchorage, being protected from all winds except those from the S. E., its continuity to the great naval establishment at Portsmouth, and its proximity to the coast of the Continent make it a favorite rendezvous of the British navy. Spithead has been strongly fortified since 1864. Besides the works on the Isle of Wight and on the mainland there are five trans-plated works built from the bottom, which are among the most remarkable specimens of modern trans-plated fortification.

*Spitzbergen*: Arctic archipelago; 400 miles N. of North Cape of Norway; between 76° 30' and 80° 30' N. lat., and 10° and 30° E. lon., consisting of West Spitzbergen, North-east Land, State Foreland, King Charles Land, Prince Charles-Ferdinand, and many smaller islands. Area, 27,000 sq. miles, with no permanent inhabitants. The islands are mountainous, the peaks often rising between 4,000 and 6,000 feet, and mostly covered with perpetual snow and ice. Only along the shore between the ocean and the mountains are in some places found patches of land, where during the two summer months, when the thermometer rises 10° F. above the freezing-point, the snow melts and a few herbs appear. The mountains contain granite, marble, and coal. Bears, reindeer, and foxes are found, and numerous seals, seals, and sea-fowl gather along the shores. The islands were discovered in 1596, and visited in 1598 by the Dutch navigator Barentz while seeking a northern passage to India. The group forms occasionally the base of operations for Arctic expeditions. Revised by M. W. HARRINGTON.

• **Spitz Dog** [used as transl. of Germ. *spitzhund*]: the Pomeranian dog, a small variety which is thought to be a cross between some of the Arctic wolf-dogs and the Arctic fox, like the Esquimaux, Siberian, Lapland, and Iceland dogs, to which, though much smaller, it has a marked resemblance. It is characterized by short and erect ears, a pointed muzzle, a curved bushy tail, and long hair, usually pure white, but sometimes cream-color or even deep black. It is brisk in its movements, useful as a watch-dog, somewhat snappish, handsome, quick of apprehension, and a favorite lapdog in Europe and the U. S.

**Spitzka**, EDWARD CHARLES, M. D.: neurologist; b. in New York Nov. 10, 1852; M. D., University of City of New York, 1873; studied University of Leipzig 1873; University of Vienna 1874; Assistant Professor of Embryology at Vienna 1874-75; Professor of Medical Jurisprudence, New York Post Graduate Medical School, 1881-82; Professor of Neurology there 1882-84; consulting neurologist St. Mark's Hospital and Northeastern Dispensary; vice-president International Medical Congress at Washington 1887; honorary president Pan-American Medical Congress 1898; author of *Insanity, its Classification, Diagnosis, and Treatment*; articles on *Organic Brain and Spinal Cord Diseases* in Pepper's *System of Medicine*; *The Architecture and Mechanism of the Brain* in Wood's *Handbook of Medicine*; *Insanity in Children* in Keating's *Cyclopaedia*; and numerous professional essays. C. H. THURBER.

**Spleen** [from Lat. *splen* = Gr. *σπλήν*; cf. Lat. *lien*; Sanskr. *plhān*, spleen]: the largest of the ductless glands of the body. In man, it is situated in the left hypochondriac region, its outer convex surface corresponding with the ninth, tenth, and eleventh ribs, from which it is separated by the descending muscular attachments of the diaphragm; its inner concave surface adjoins the great pouch of the stomach. It also comes near to the pancreas, left kidney, left lobe of the liver, and arch of the colon. It is held in position by a peritoneal reflection from the diaphragm, called the suspensory ligament. It is even more directly related to these adjacent viscera by its blood-supply, the splenic artery being the largest branch of the coeliac axis, the trunk which gives off the nutrient vessels of the stomach, liver, and parts of the small intestine. The variable size and gross and minute structure of the spleen indicate that it is a great vascular reservoir. In health it is 5 inches long, 3 to 4 thick, and 1 to 1½ in breadth, and weighs 7 oz.; it is larger immediately after eating, and in malarial and certain other diseases may weigh 15 or 20 lb., and occupy the abdomen down to the pelvic bones. The fibrous capsule of the spleen is very elastic; it is reflected inward on the vessels as they subdivide, thus forming a system of ramifying partitions, which constitutes the fibrous framework of the spleen. The interspaces of this structure are occupied by the substance of the spleen, a soft, pulpy mass of dark, reddish-brown color, consisting of granular matter, red and white blood-cells, and the Malpighian corpuscles—masses of lymphoid cells closely packed about the terminal arterioles.

The functions of the spleen are not definitely known, but it is certainly the birthplace of both white and red blood-corpuscles. It is active also in the destruction of red corpuscles, but less so than was formerly supposed. It is not an indispensable organ, for it has been removed in animals and men with no serious or marked result. The spleen is frequently congested in the course of infectious diseases, such as typhoid fever, malaria, typhus fever, and the like, and is often permanently enlarged by repeated congestions, infiltration, and hypertrophy of its tissue. There may be supernumerary spleens. The spleen is liable to rupture and fissure from external violence. See HISTOLOGY.

Revised by W. PEPPER.

**Splint**: a bony growth, generally upon the inside of the fore leg of the horse, below the knee. In young horses it is usually caused by overwork. Rest, poulticing, and packing with cold wet compresses are recommended for the early stages. At a later stage, iodine, mercurial ointment, blisters, and the actual cautery may be usefully employed, but not till the inflammation is gone. If the tendons are interfered with, veterinary surgeons sometimes remove the splint.

**Splint**: in surgery, a piece of wood, leather, pasteboard, gutta-percha, metal, or other material employed to prevent displacement of the fractured ends of bones or for other analogous purposes. In many cases surgeons use bandages

stiffened with gypsum, starch, dextrine, or gum-arabic in the place, and a very great number of splints have been devised for special purposes in surgery. See FRACTURE.

**Spil'gen**: a mountain-pass of the Alps leading from the Swiss canton of the Grisons into Italy over an elevation of 6,946 feet. On the Italian side it is covered at many places with galleries of solid masonry to protect travelers from avalanches. These galleries were built by the Austrian Government, and finished in 1834.

**Spofford**, AINSWORTH RAND, LL. D.: librarian; b. at Gilmanston, N. H., Sept. 12, 1825; received a classical education by private tuition; became principal librarian of Congress 1865, after having been previously employed in publishing and editing; is member of many historical and philosophical societies; has written much for the press on historical topics. He has published *Catalogues of the Library of Congress*; *The American Almanac and Treasury of Facts* (1878-89); *The Library of Choice Literature* (1881); *Library of Historic Characters and Famous Events* (1894); and other works. During his tenure of the office of librarian the national collection has grown from 90,000 to about 700,000 volumes, and the change in the law of copyright has been effected by which all copyrights are entered and all facts regarding literary property verified at one central office at the Library of Congress, Washington, D. C., instead of being scattered, as was the case prior to 1870, in the offices of the district clerks throughout the country.

**Spofford**, HARRIET ELIZABETH (*Prescott*): poet and story-writer; b. at Calais, Me., Apr. 3, 1835; removed at the age of fourteen to Newburyport, Mass.; attended school at Derry, N. H., and early began writing stories for the magazines; married in 1865 Richard S. Spofford, a lawyer of Boston, and subsequently resided at Amesbury, Mass. Among her publications are *Sir Rohan's Ghost* (1859); *The Amber Gods, and other Stories* (1863); *Azarian* (1864); *New England Legends* (1871); *A Thief in the Night* (1872); *Art Decoration applied to Furniture* (1881); *The Marquis of Carabas* (1882); *Poems* (1882); *Hester Stanley at St. Mark's* (1883); *Ballads about Authors* (1887); and *A Scarlet Poppy* (1894). Revised by H. A. BEES.

**Spohr**, LUDWIG: composer; b. at Brunswick, Germany, Apr. 5, 1784. His father was a physician. He was early noticed by the Duke of Brunswick, placed on the civil list, and furnished with means for study and travel. His masters on the violin were Maurer and Eck; visited Russia; in 1804 began his professional career in Germany; was concert conductor under the Duke of Saxe-Coburg-Gotha; in 1813 was in Vienna, in 1816 in Italy, in 1817 in Frankfurt and London. A residence of some years in Dresden followed, and continued till he was called to the office of chapel-master at Cassel. D. Oct. 22, 1859. Spohr was possessed of fine sensibility and immense activity. Skillful in construction, elaborate in finish, a master of harmony and instrumentation, poetic in sentiment, imaginative, sympathetic, he ranks with the great, although not the greatest, composers. He was the violinist *par excellence* of his day. His book of instruction for the violin is a standard work. He composed in nearly every style—duos, quartettes, quintettes, sonatas, variations, overtures, cantatas, nine symphonies, five or six operas, several oratorios, songs with pianoforte accompaniments. His most famous pieces are the symphony *The consecration of Tones* and the oratorio *The Last Judgment*, which is rather a collection of musical gems than an evenly developed structure. A vein of mournful tenderness pervading his compositions suggests monotony and mannerism. A critic has said that "if all the works of Spohr could be destroyed except one specimen in each class of composition, it would be of advantage to his reputation."

Revised by DUDLEY BUCK.

**Spoils System**: in politics, the system of bestowing public offices upon members of the party in power as rewards for political services. See CIVIL SERVICE AND CIVIL SERVICE REFORM.

**Spokane'**: city; capital of Spokane co., Wash.; on the Spokane river, and the Gt. Northern, the N. Pac., the Or. Railway and Nav. Co., and the Spok. Falls and N. railways; about 15 miles W. of the boundary-line between Washington and Idaho (for location, see map of Washington, ref. 3-J). It is at the falls of Spokane river, and has a very picturesque location. The business portion is built about the falls, with broad streets running N. and S. and E. and W., and some of the residence districts are on higher ground.

The streets are lighted by electricity, and the view from the hill on which the city is at night particularly striking. Spokane has several public buildings of importance. The city hall is an attractive building of brick and granite, the auditorium located on level ground, the opera house, has a capacity of 1,500, the county court house is of conventional pressed brick, on a slight incline, and cost \$50,000, and the *Globe* is a typical building of importance for the commercial properties and business of Spokane. The city has an extensive system of drainage, and sewerage including an elaborate system of water-works in 1904.

**Universities and Schools.**—Spokane is the seat of a bishopric, the Protestant Episcopal Church, and the Jesuits have two minor church buildings, several parochial schools, and a college. The first university came to Spokane when it was a mere village, and acquired an extensive tract of land, upon which the city limits, by which their college has become well endowed. The city has eleven public school buildings, including a high school building, ranging in cost from \$100,000 to \$100,000. More than 100 teachers are employed, and there is a daily attendance of about 3,000 pupils. The Sisters of the Sacred Heart maintain a hospital and an orphanage house, and the Protestant women have established a Home for the Friendless.

**Finance and Banking.**—In 1894 the city had a property valuation of \$15,000,000 and a bonded debt of \$1,000,000. The receipts from all sources are about \$300,000 per annum, and expenditures something less. The tax levied is 31 mills. There are three national banks with combined capital of \$7,000,000 and surplus of \$750,000.

**Business Interests.**—The river is not only a source of domestic and superior water-supply, but it has a series of falls over a distance of half a mile as it passes through the river, from which power is obtained to operate about 100 miles of electric street-railways, many mills and factories, an electric-lighting plant, printing-presses, elevators, and small machinery generally. This admirable water-power has made Spokane an important center for the manufacture of flour. The output of the mills is about 2,000 barrels a day, mostly exported to Japan and China.

**Railways.**—In 1879 the site of Spokane was occupied by an Indian trading-post and a sawmill. The Northern Pacific Railroad was completed as far as Spokane in 1884, and from that time the place had a rapid growth. It became a chief supply-point for numerous mines of gold and silver in Eastern Washington and Northern Idaho, and a very rich agricultural region to the S. When at the height of its prosperity, in Aug. 1899, it was almost wholly destroyed by fire, the burnt area covering about 60 acres. More than \$5,000,000 was invested in business blocks within two years. During the same period there was a rapid concentration of railways here. The Great Pacific was the second transcontinental line to arrive, and the Great Northern came in 1902. The main line built numerous branches in all directions from the city, and the Spokane and Northern, an independent road, was built into British Columbia. The result was that at the close of 1902 Spokane had eight railroads and had terminus of the most important railway success of the Pacific coast. In the winter of 1904, at its old-time point 1,000 acres of land adjoining the city to the U. S. Government in consideration of the establishment thereon of a large military post, and Congress passed a law in Jan., 1905, creating the post. Pop. (1903) 300; (1909) 10,000; (1910) estimated, 24,000.

JOHN R. KEAY.

**Spoleto** (anc. *Speltium*) town, in the province of Benevento, Italy; about 60 miles S. N. E. of Rome, on a slight elevation. The statue of an ancient volcano (see map of Italy, vol. 5-7). The old castle, whose foundations date from the time of Theodoric, stands on a height above the town, from which it is separated by a stream. The water supplied by a single fount but long and 280 feet high, originally Roman, but rebuilt, probably in the fifth century, and now serving as an aqueduct as well as bridge. The old Roman archway, known as the Porta della Pace, is according to tradition a monument of Hannibal's time. The great Palazzo Municipale is a tower of the eleventh century. Pop. 7,000.

**Spodios.** See *Hyacinth*.

**Sponge Fisheries.** These industries which consist in gathering the sponges of commerce, which is the *Marina*, from the network surrounding when the fleshy matter has been washed away from one of the *Spongia*. The value and consequent value of a sponge depends on the

texture and elasticity of the fibre, and the various species of the same species depending on the conditions under which the sponge has lived. The best sponges grow in great quantities, from 150 to 200 feet deep, those found where the water is shallow or rather brackish being inferior. The principal commercial species are *Spongia officinalis*, which inhabits the Mediterranean and the Ionian seas, the *Spongia* of the Atlantic and the deep sponges of Florida and the Bahamas, *Spongia* system, containing the large sponges of the Mediterranean and the deep sponges, red-sponges, and the other sponges of American waters. *Spongia* *apertus*, comprising the sponges of the Mediterranean and the yellow and least hard sponges of America. There are numerous varieties of these species while commercially from about a twenty-five grades are recognized. From being in value from twenty-five cents to \$100 per pound, the *Marina* sponges being the most expensive. The greater portion of the sponges of commerce, as well as the best quality, come from the Mediterranean and Adriatic, shipping from coast extending from Syria, on the northern coast of Africa, to France. Some sponges are also taken in the Red Sea, and large quantities, mostly of the common varieties, in Florida and the Bahamas. Good sponges also occur on the Australian coast and at other points in the Pacific, but as yet they have been gathered only for local use.

**Methods of Gathering Sponges.**—Sponge-fishing is merely carried on from small rowboats and where larger craft—ranging from 5 to 20 tons—are employed they are used to transport the boats to the fishing-grounds and to market the catch. The greater portion of the sponges are gathered from the bottom by a spear with four or five prongs; but, owing to the weight of the handle, this implement can be used only in water under 10 feet deep, because that depth-divers are employed, or in some localities a dredge. In connection with the spear a water-glass is commonly used, this being a tube of wood or metal 3 or 4 feet long, with an end of glass. When this is lowered into the water the bottom can be seen through it plainly. In some localities in the Mediterranean the primitive method is followed of tossing a stone dipped in oil ahead of the boat. There are some variations in the process of preparing sponges for market, but in the main it is as follows. After the sponge has been taken from the sea it is exposed to the air until decomposition sets in, and is then washed with a stick or trodden under foot in water till the soft parts are removed. In Florida the practice is to place the sponge in water where the animal matter decomposes, and is washed out by the tide. After cleaning the sponges are bleached, dried, and baled. The annual import of sponges into Great Britain is about \$1,000,000. The Florida sponge-fishery for 1899 amounted to 396,772 lbs., worth \$428,682. Successful experiments have been made in cultivating sponges, but as yet the work has not been carried on on a large scale. Fresh sponges are cut into pieces about an inch square, care being taken to injure the outer skin as little as possible. The cuttings are skewered on bamboo rods, each rod bearing three pieces, and these are attached to beams and sunk in favorable localities. The drawback to sponge-culture is the fact that it requires from three to seven years for a sponge to attain a marketable size; on the other hand small or ill-shaped sponges, which would otherwise be of little or no use, can be used in this way. F. A. LUCAS.

**Sponges** (from G. Fr. *spongia*; Fr. *sponge*; Ital. *spongia*; Span. *esponja*; Lat. *spongia* = Gr. *σπῆγξ*, *σπῆγξ*, *σπῆγξ*) the members of the group *Spongia* of *Porifera* of zoologists. The sponges are animals of remarkably uniform structure, although varying greatly in appearance. In all formations layers may be distinguished: (1) a flattened ectoderm of cuboidal cells (ectoderm) covering the outer surface; (2) a digestive layer (mesoderm) of columnar cells, each with its free end surrounded by a delicate collar from which projects a whip-like flagellum; and (3) between these two a third layer (mesoderm) in which the skeletal elements and the reproductive cells are. In the simplest sponges these layers are arranged in the form of a cup, the bottom or closed being fixed with ectoderm, the outer surface covered by ectoderm, the mesoderm being between the two. In other forms the arrangement becomes more complicated. All over the outer surface are minute openings or pores which communicate with canals and through these water enters the mass of the sponge. In this the water brings and supply large numbers of substances (nutrients) from the outside, and from them expels the water is collected into currents

canals and transported through the cloaca to the exterior. In any common sponge the general course of these canals

FIG. 1.—Diagram of a part of a sponge showing the pores and incurrent canals, *i*, communicating with the ampullae, *a*; and the excurrent canals, *e*, leading from the ampullae to the cloaca.

can be traced among the fibers. (See Fig. 2.) In these forms the digestive layer is restricted to the ampullae, while the ectoderm lines all the canals. Nourishment is obtained from minute particles drawn in with the water which is constantly passing through the body.

FIG. 2.—Section of a sponge (*Tethya*) showing the cloaca and the canal system in outline.

greatly among different sponges. Each spicule is the product of a single cell, and is formed on the outer surface of the secreting body. These spicules are of two kinds; in the one they are composed of calcium carbonate, in the other

in the same sponge. The fibers form a continuous network, and are the result of secretion from the ends of numerous cells. Chemically they consist of a peculiar organic sub-

FIG. 4.—Development of a calcareous sponge (after F. E. Schulze): A, early segmentation of egg; B, blastosphere stage (close of segmentation); C, gastrula after fixation; D, young sponge after formation of spicules; *ec*, ectoderm; *en*, endoderm; *p*, incurrent pores; *o*, ostiole; *r*, radial tubes.

stance known as spongin. When spicules and fibers occur in the same sponge the spicules are imbedded in the fibers.

In the mesoderm (the layer which forms the skeletal elements) are the reproductive elements. These consist of eggs and sperm-cells, and it is only after the union of these two that the egg will develop. In the process of development the egg segments (see EMBRYOLOGY), and then, in the forms most studied, one side of the egg pushes into the other, thus giving rise to the embryo known as a gastrula, in which ectoderm and endoderm are differentiated. The gastrula becomes fixed to some solid body, and pores break through the wall, forming the beginning of the incurrent-canal system. Later the excurrent opening or ostiole is formed, and all subsequent changes are the result of partial division or budding from this larva. The skeleton arises early, and in its future growth keeps pace with the general growth of the sponge.

FIG. 5.—*Leucosolenia*, one of the calcareous sponges, and three of its spicules, enlarged.

Various systems of classification of sponges have been advanced. The best seems to be that which divides the group or branch into two classes, *Calcareae* and *Siliceae*. The *Calcareae* (those with calcareous spicules) are all small, marine, and without any economic importance. According to the complication of structure they are subdivided into three orders. Fig. 5 is an illustration of one of the simplest forms.

The great majority of sponges belong to the *Siliceae*, in which spicules, when present, are siliceous in character. Some forms, however, are degenerate, and have lost the spicules, while in a few, which form their encrusting sheets, all skeletal structures are absent. Three orders of *Siliceae* may be recognized. In the first, or *Heractinellidae*, the spicules are six-rayed, and the resulting skeleton is extremely regular. These forms occur as fossils and in the deeper parts of the ocean, and include the "glass-rope sponges" and that beautiful form termed the "Venus's flower-

FIG. 3.—Different kinds of sponge spicules, enlarged.

of silica; and upon this chemical basis sponges are divided into two classes. Fibers and siliceous spicules may occur

deeper parts of the ocean, and include the "glass-rope sponges" and that beautiful form termed the "Venus's flower-

highest sponge." In the second order, *Sphaeroporia*, the sponges are more varied by heavy fibres. Here belong the larger sponges known as "Nepenthes-sponges," and from these groups have apparently come those famous softest skeletons. The last division, the *Chamaespongiae*, have heavy fibres, while sponges may or may not be present. In this group belong the only fresh-water sponges, and also species of sponges which inhabit the rivers and ponds of the U.S. The theory of sponges frequently injures the water-supply of cities. The two main groups also belong the sponges of commerce. For the present art, etc., see *Reproductive Systems*. The literature of the sponges includes nearly 3000 titles. The last in 1900 can be found in *Handbook, Systematic Position and Distribution of Sponges in New Zealand* (1900). Important paper papers are *Neospongia*, *Enospongia*, in *Journal of the American Microscopical Society* (1900), *Schäfer, Handb. d. Zoologie*, in vol. 4 of *Handb. d. Zoologie* (1900), *A. S. Krieger*.

**Spongers** (from Lat. *spongia*, pumice, sandy, in Latin Latin *spongia*, delft, of *spongia*, pumice, pumice, sandy, etc.) of the water, make a habit of the gold, as generally, those who in any way become experts for gold, as generally are called the baptism of an infant promise in the name that it shall lead a Christian life; a godfather or godmother. The spongers also find themselves to see to it that the child shall receive Christian baptism. Usually, in the Roman Church, there are two spongers, a man and a woman, and the relation of godfather or godmother and godchild is said to be a real one, precisely as though it were one of consanguinity. The rule of the Church of England calls for three spongers, two of whom are of the same sex as the godchild, and an engagement to marriage contracted by this relation. The present Anglican rule also permits parents to act as spongers.

**Spontaneity** (Med. Lat. *spontaneus*), a term used in metaphysics to designate causation. It is sometimes contrasted with freedom. Freedom involves not only spontaneity, but also conformity to law or consistency with itself. More spontaneity may contrast with yet by its own power, and from the entire series may reduce to zero, thus permitting the freedom by external acts. The causation of spontaneity is due to strict necessities, who think all events under the form of necessity, making each effect to flow from an essential cause; but an examination of the causation of spontaneity discloses that the ultimate cause is "necessity of conditions"—must be self-determining or spontaneous. Everything that happens must ultimately flow from a spontaneous activity. This spontaneity and spontaneity, however, can be shown to be permanent will or also dependent on it in the last analysis. Some have tried to show in the philosophy upon the spontaneity of human conduct distinguished from the rationality of it. While reflection depends on the arbitrary will of the individual and is subject to error, the spontaneous natural activity of man is above reflection and self-determination, and can little to error. Such a theory of reason was applied in the support of a prior time upon which the modern system was built. Schelling's "Intellectual Intuition" and Hegel's "Idea of the Reason" were used much in the same way, also, "intuition of the reason" which requires a prior time, according to many contemporary philosophers, corresponds to a certain "spontaneity." It is noteworthy that Hegel regarded the philosophy perception of the principle of the true nature of knowledge to be a higher order of reflection, and was a third intuition of the mind (see *Metaphysics*), which Hegel would make it a first intuition. *WILHELM T. HANKE.*

**Spontaneous Combustion**: combustion which takes place without the application of heat or other means spontaneously attempted to promote that end. Lower materials have remained exposed to the sun's rays, and phosphorus, when in a dry state, has often taken fire at the touch of the hand, on account of the affinity for oxygen. In fact, it is this same principle, in a number of cases, which causes spontaneous combustion in the case of other bodies, so that oxidation, which will increase it will increase the tendency to spontaneous combustion. Mechanical dynamism increases it greatly, as, for instance, a larger surface to the action of oxygen, and in increasing the combining power of the bodies which are the subjects of such action, or iron are reduced by hydrogen, and a fast heat, the resulting finely divided metal takes fire when poured into the air, but if heated too highly, they become agglomerated and lose the property, unless

some finely divided powder is present to keep them burning, such as alumina precipitated with the metallic matter, readily formed charcoal is liable to take fire, owing primarily to combination of oxygen in the pores; on this account it is not ground for making compressed metal (it has been kept for a time). Recently exposed fired carbons may burn and glow and carbon and hydrogen, the temperature of incandescence, from random, and similar bodies soaked with oil, grease, turpentine, varnish, etc., will rise on this account, and the low combining power of such materials helps the process, and very often the cause takes fire. Sections and fragments have resulted from this cause. Hydrocarbons, especially when containing much pyrites, is liable to spontaneous combustion, when powdered with water. Manganese and spontaneous combustion also in the case where rates of change by of highly mixed gases have taken fire. Many have probably been burned in the way. Sponges are covered with oil or grease, and such bodies as are less than than spontaneously combustible. Some gases ignite spontaneously, as phosphorus and hydrogen. The illuminating oil distilled from petroleum sometimes gives off gases that will ignite spontaneously before it is refined in the "refiner." There are also spontaneously combustible liquids, of which alcohol is an example. (See *Phosphorus*.) There are a number of all sorts of cases of spontaneous combustion of the human body, but there is hardly an instance which admits of no other explanation. Indeed, considered that the dead body of a fat man, who had been interred with alcohol, might possibly burn, but that in no circumstances could a body, in which the blood is circulating, take fire.

Handled by H. A. ROBERTS.

**Spontaneous Generation**: See *GENERATION, SPONTANEOUS*.

**Spoonbill**: any one of two or six spoon-shaped wading birds closely related to the ibis, and remarkable for their spoon-shaped bills. The family *Platystrophia* to which they belong has been divided into two genera, *Scolopax*, to which the lesser portion of the family is referred, and *Platystrophia* to which it is assigned. The minute spoonbill (*Alimosa alpestris*) of tropical and sub-tropical America the sole representative of the latter named genus is from 20 to 25 inches long, the back orange, and under parts of a delicate rose-color, the lower neck, smaller wing-coverts and tail-coverts of a rich carmine hue, legs darker. The bill and bald head are varied with tints of green, yellow, and black. This bird occurs in the southern parts of the U. S., but is nearly growing scarce as it is much sought after. The birds of the genus *Platystrophia*

European spoonbill (*Platystrophia leucorhoa*)

are mostly white, and are found in Europe, Asia, and Australia. *Platystrophia leucorhoa*, the only species found in Europe, was formerly in some demand for the table. In the U. S. the name spoonbill is also applied to the *Scolopax* species. The spoonbill, sometimes is *Larus argentatus* pinn. gulls, of Northeastern Asia, occurring occasionally in Alaska. *P. A. LANGE.*

**Sponner**, SUGARSHED, M. D.: author, B. at Brooklyn, N. Y., in 1862, graduated at Middlebury College 1880, and at New York College of Physicians and Surgeons 1885, and is located in New York. He was the author of several professional treatises, of *Illustrations of Practice, Diagnosis, etc.* (1893), and of a *Diagnosis and Clinical Pathology*

of *Painters, Engravers, Sculptors, and Architects* (1853; new ed., 2 vols., 1865), containing notices of 12,000 artists. D. at Plainfield, N. J., in Mar., 1859.

**Sporades**, spor-ă-deez [= Lat. = Gr. *σπορᾶδες* (sc. *νῆσοι*, islands), liter., fem. plur. of adj. *σποράς, σποράδος*, scattered, deriv. of *σπέρειν*, scatter]: those islands in the Grecian Archipelago which are not included in the group of the Cyclades. In a restricted and more accurate sense it includes only the islands near the west coast of Asia Minor between Samos and Rhodes. The more important are Samos, Nicaria, Patmos, Kalymno, Cos, Syme, Telos, Scarpanto, and Rhodes. All belong to the Ottoman empire and are comprised in the vilayet of the Archipelago. The cluster of islands N. of Negropont is sometimes called the Northern Sporades. Scyros, Scopelos, Sciathos, and Halonnesos are the chief. They belong to Greece. E. A. GROSVENOR.

**Spore** [from Gr. *σπόρος*, sowing, seed, deriv. of *σπέρειν*, scatter, sow]: in botany, a "single cell which becomes free and is capable of developing into a new plant" (*de Bary*). Sachs attempted to limit the term by defining a spore as "a reproductive cell produced directly or indirectly by an act of fertilization," reserving the term *gonidium* for those reproductive cells which are produced without any previous act of fertilization. Bennett and Murray, on the contrary, apply the term to "any cell produced by ordinary processes of vegetation, and not directly by a union of sexual elements, which becomes detached for the purpose of direct vegetative propagation." Adopting *de Bary's* definition, spores in Sachs's sense are sexually produced, or briefly sexual spores, while those of Bennett and Murray are asexual spores.

Many kinds of spores are distinguished by botanists, only the more common of which are noticed here. *Ecidiospores* are cells formed by abstriction in the "cluster-cup" stage of a rust. (See RUSTS.) *Ascospores* are spores formed by internal division of the protoplasm of a cell, termed an ascus. (See ASCOMYCETES.) *Auxospores* are the larger cells occurring in the life-history of diatoms, each the starting-point of a new series of divisions. *Basidiospores* are cells formed by pullulation and abstriction from a cell termed a basidium. (See BASIDIOMYCETES.) *Carpospores* are spores formed in a sporocarp, e. g. in liverworts and mosses. *Chlamydospores* are thick-walled spores formed singly and asexually in the cells of various simple algae and moulds. *Conidiospores*, *conidia*, or *gonidia* are cells formed asexually, usually by abstriction of a little-modified hypha. *Macrospores*, in pteridophytes, are the large spores which upon germination form prothallia-bearing female organs. In anthophytes the embryo-sac is the homologue of the macrospore. *Microspores*, in pteridophytes, are the small spores which upon germination form minute prothallia-bearing antherids. In anthophytes the pollen-cell (pollen-spore) is the homologue of the microspore. *Oöspores* are cells produced by the fertilization of oöspores by antherids. When thick-walled they are often called *resting-spores*. A *sporidium* is a compound spore, or a spore-cluster; each spore in such a structure is known as a *merispore*. A *sporidium* is a small spore abjoined on a promycelium. *Stylospores* are stalked spores; the term is sometimes restricted to those formed in pycnidia. *Teleutospores* are the spores, one to many, formed in the tightly fitting asci of the *Uredineæ*; the term is commonly applied to the asci with their contents. *Tetraspores*, in the red seaweeds (*Florideæ*), are the spores formed in tetrads by the fission of a mother-cell. *Uredospores* are the stylospores of the *Uredineæ*. *Zoöspores* are motile spores, always aquatic. *Zygospores* are cells produced by the union of similar cells; known also as *resting-spores*. See FUNGI. CHARLES E. BESSEY.

**Sporezo'a** [from Gr. *σπόρος*, seed + (*ζῷον*, animal): a class of protozoans the members of which are parasitic in all stages of their existence. They lack all special organs of locomotion, and reproduce by the conversion of the protoplasm of the cell into minute particles or spores, which, frequently passing through an amoeba-like stage, develop into the adults. Four sub-classes are recognized: GREGARINIDA (q. v.), *Amöbosporida*, *Sarcosporida*, and *Myxosporida*, of which only the first contains many species. By many writers the disease known as cancer (*carcinoma*) is regarded as the result of parasitism of sporezoans in the body. J. S. K.

**Sports**: in general, diversions of the field or of the turf; in a special sense, contests between athletes. Apparently the earliest competitive athletic sports were those of Greece and Rome, from 1,000 to 2,000 years B. C., though the name

athletic is of recent application and in its Greek origin referred only to those who competed for prizes in public games, thus separating into a distinct class the *ἀγώνες*, who exercised and competed with each other for pleasure or improvement. In earliest times the best citizens competed at the Olympian, Pythian, Nemean, Isthmian, and Panathenæan games, and highest honors were paid to the winners, but a professionalism very similar to that of these times appeared, and the dignity given to the contests was lost. The events open to competition were foot-racing, leaping, throwing the discus, wrestling, boxing, and the pancratiun, a combination of boxing and wrestling, and, separate from these, chariot-racing.

When the Romans invaded Britain they brought with them the games of the soldiery, such as jumping, running, hunting, swimming, and combats on horseback. With the advent of the Saxons came skating, hawking, and wrestling, and in the Norman era were introduced the more accomplished arts of the tourney and joust. In the seventeenth century cards, dice, hawking, following the hounds in chase, football, bowling, quoits, wrestling, fencing, shovelboard, shuttlecock, and billiards were of prevalent interest. Bull and bear baiting and cock-fighting came in the eighteenth century, and were popular with people of both sexes. It is interesting to note the revival of football in the eighteenth century, it having been a sport of so much prominence in the early part of the fourteenth century. It was prohibited in England in 1349 because it interfered with the other sports. Falconry, or hawking, has almost disappeared from England, its place being largely taken by fox-hunting. Fox-hunting, so called, is popular in some parts of the U. S., where often the presence of a fox is made unnecessary by dragging a bag of anise seed, which leaves a scent in its trail, over the ground where the hunt (♂) is to take place. The hounds follow this scent readily.

Wrestling, boxing, and pedestrianism have been popular for centuries, but it was not until well along into the nineteenth century that the interest in athletic sports developed into a passion.

The schools and colleges of Great Britain early took active part in organizing athletic clubs. In 1837 the Rugby Crick Run was founded, and Mar. 27, 1858, an annual steeplechase was inaugurated, both at Rugby, and the School Hunt was started at Shrewsbury in 1842.

Oxford and Cambridge met at Christ Church Cricket-grounds, Oxford, Mar. 5, 1864, for the first inter-varsity athletic competition. The events were running 100 yards, 440 yards, and 1 mile; jumping, both for height and distance; hurdling, 120 and 200 yards, and steeplechasing. Each of the competing teams won four of the events.

The first important athletic meeting held in London was that of the Civil Service Athletic Sports at Walham Green, on Apr. 22 and 23, 1864. In 1863 the Mincing Lane Athletic Club was formed, which in 1866 became the now famous London Athletic Club.

From about 1861 the development and spread of athletics all over the civilized world has been prodigious. Since the civil war the U. S. has kept pace with Great Britain, and scarcely a city of 20,000 inhabitants can be found in North America or Great Britain which has not at least one flourishing club for the promotion of general athletics. In Germany and France the same interest is noticeable, and it has developed in a large degree all over Europe, Australia, and the British colonies.

Since 1880 athletics has become a most important feature of scholastic life throughout the U. S., and seems to be substituting itself for the lawlessness exhibited by students in class rushes and hazing affairs. In many institutions of learning the encroachment of organized sports upon purely scholastic occupations has caused some of the governing bodies to place practically prohibitory restrictions on some of the games, most notably upon football.

*Professionalism* has played a most important part in general athletics, and that part has not in all respects been good, so that very carefully prepared definitions of an amateur have been adopted by practically all amateur clubs in the U. S., Great Britain, Canada, and France, and competitors at the amateur meets are obliged to qualify in accordance with their terms.

In the eastern part of the U. S. the definition of an amateur, as adopted by the Amateur Athletic Union, is generally accepted, and is as follows:

"One who has not entered in an open competition; or for either a stake, public or admission money or entrance-

base, or under a fictitious name, or has not competed with an opponent performing for any prize or whose performance is judged, or who has not competed, pursued, or aimed at the pursuit of athletic exercise as a means of livelihood, or for gain or any consideration, or whose membership in any athletic club of any kind was not brought about or continued or sustained because of any mutual understanding, express or implied, whereby his becoming or continuing a member of such club would be of any pecuniary benefit to him, whatever, direct or indirect, and who shall in every and all respects conform to the rules and regulations of this organization.

**Definition of a Game.**—The sports over which the A. A. A. defines an election shall be divided into the following classes: Baseball, football, bowling, boxing, fencing, football, gymnastics, hurdling, jumping, lacrosse, basketball, polo, hunting, putting, shot, sports, wrestling, tennis, running, swimming, skating, swimming, throwing the hammer, tug of war, walking and wrestling. An athlete shall not be a member in each of these twenty-four classes until he shall have won a prize in competition in that class open to the membership of two or more clubs. The winning of such a prize shall prevent his future competition as a novice in that class although his entry may have been made before he had his standing as a novice.

The English Amateur Association has adopted the following definition:

An amateur is any person who has never engaged in, nor assisted in nor taught any recognized athletic exercise for money, or who has never, either in public or in private, used or exhibited his skill for a public or for a private stake, or for remuneration, or for a purse or for gate-money, and never included or allowed himself to be included either in a public or private tour.

A novice is one who has never won a prize in a similar class of competition, or winning a prize for walking would not disqualify for running, and vice versa; but winning a prize for running any distance would disqualify for running. This rule does not apply to school and boys' games.

The Pacific Coast Association is somewhat more liberal in its definition, as are the associations of Canada and Mexico.

Professionals are found in nearly all branches of sport, and while they undoubtedly raise the standard of the sports in that they make the records high, it is a fair question if it would not be better if amateur effort alone set the mark for constant competition. Footballism, which was popular with professionals a few years ago, is fast disappearing from all competitions. Walking-matches are no longer popular, and largely because of the difficulty of differentiating a walk from a run. Archery, which was and still is popular in Great Britain, has never been very popular in the U. S. The same may be said of the game of cricket, its place being largely taken by baseball.

Most of Scottish and Irish clubs are held annually wherever Scotland or Ireland are to be found. The Irish games are very similar to those held throughout the C. St. from the Scotch after variety in tossing the caber—a log 10 feet long with a diameter of 11 inches at one end and 5 at the other—quoit-throwing, and a sword and buckie dance. A Scottish winter game called curling is becoming deservedly popular in North America, especially in Canada.

Most of the popular interest in general athletics in the C. St. gathers about the annual meets of the metropolitan and intercollegiate clubs. The records of these meets are annually published in the principal newspapers, and in several almanacs and sporting annuals.

Fishing and hunting will always be popular with sportsmen, and nowhere are better opportunities afforded than in the U. S. and Canada. Strained game-laws have been passed in most of the States, so that the wanton destruction of game is prohibited by the entire destruction of the birds, and of the game-lands in Ohio, and of the salmon in some of the Western rivers—has been stopped. The U. S. Fish Commission is now making lakes and rivers with game fish, and game production associations are seeing that game laws are enforced.

For extended accounts of various sports, see BASEBALL, FOOTBALL, GOLF, TENNIS, TUG OF WAR, LACROSSE, LAWYERS, etc.

**SPORTS.**—See *Sports and Pastimes of the English People*, The Institution Library, Bell's Hamilton of *Athletic Sports*.

**Sports Book of.**—A proclamation by James I. of Great Britain issued in 1618, ordering forth various games which might lawfully be indulged in on Sundays after church services. Among the sports allowed were "dancing, archery, hunting, snailing, May-games, Whitsun-tides, merry-making, and the setting of May poles." It was designed to obviate dangerous amusements by Protestant amusements with popular recreations. These having, ball-batting, bowling, and "spittles" were forbidden on Sundays. Charles I. renewed the proclamation in 1625. In 1644 the Long Parliament directed that all copies of the *Book of Sports* be burned by the common hangman. In both instances the publication of the *Book of Sports* gave rise to intense excitement, and aroused the strongest opposition among the Puritans. See *Grove*, *The Kelly's Book of Sports* (1924).

**Sports Salar.**—See *SALARY*.

**Spotswood, ALEXANDER**, governor of Virginia, b. at Tidewater, Africa, 1676; was deputy governor-general under the Duke of Northborough, went to Virginia as governor 1710, and held office until removed in 1729; deputy postmaster-general 1730-39; was the pioneer of iron manufacturing in Virginia; was organizer of an act improving the staple of tobacco, and making tobacco a medium of common exchange; lent grain and to William and Mary College; was made governor-general 1740 and placed in command of an expedition to the West Indies; died at Annapolis, Md., June 1, 1740, before the embarkation took place.

**Spotswood, or Spottiswood, JOHN**, prelate and historical writer; b. in Scotland in 1545; was educated at Glasgow, and in 1601 went to France as chaplain to the Scottish ambassador. He accompanied James VI to London in 1603, and in the same year was made Archbishop of Glasgow and a member of the privy council for Scotland; in 1615 was made Archbishop of St. Andrews and Primate of Scotland. Through his influence, the Perth Assembly sanctioned the Five Articles (1619). In 1620 he crowned Charles I. at Holyrood, and in 1625 became chancellor of Scotland. He drew great obloquy on himself for the part he took in the examination of John Gillespie, a Jesuit priest, who was apprehended at Glasgow and hanged for refusing to discuss the temporal power of the pope, and in the prosecution of Lord Baltimore, who was condemned to death for the crime of "blaspheming" (swearing sedition), and pardoned only after a long imprisonment. Spotswood, his personal enemy, taking no active part in the proceedings. In 1607 he obnoxious to introduce the new liturgy and book of canons into Scotland, urged on by the king and laity, and, as it was, contrary to his own wish. Resented from the churchmen ship by King Charles, deposed from his bishopric by the assembly convened at Glasgow in Nov., 1625, excommunicated, and declared infamous, he fled to London, where he died Nov. 26, 1649. He wrote a *History of the Church of Scotland* (published in 1625), the greater part of which treats of the history of his own times. Among his other writings is a Latin treatise *Historia Libelli de Regimine Principis Scotiarum*, written in answer to a tract of Calderwood, published in 1620. His *Life* was written by Bishop Duppa, and by Bishop Russell the latter prefixed to the "ecclesiastical society edition of his *History of the Church of Scotland*.

**Spottsylvania Court-house, Battle at.**—See *WILHELMINA*.

**Sprague**, town; capital of Lincoln co., Wash.; on the Northern Pac. Railroad; 42 miles S. W. of Spokane (for location, see map of Washington, not a city). It is in an agricultural and stock-raising region, in the trade-center of the Big Bend country, and supplies railway coach-shops and car-wheels that cost \$250,000, a national bank with capital of \$200,000, and a daily and three weekly newspapers. Pop. (1880) 1,861; (1894) estimated, 2,000.

**Sprague, CHARLES**, poet; b. in Boston, Mass., Oct. 28, 1791; educated at the Franklin School, Boston. He entered mercantile life at the age of thirteen, and was a clerk of the Globe Bank from 1825 to 1845. He wrote poems, prose, and the editing of *Knickerbocker* and *Knickerbocker*, and other occasional pieces, the best known of which is *The Spectator* (1845), revised at the Boston Theater in 1827. A collected edition of his writings in verse and prose was published in Boston in 1841 (revised edition in 1850, 1855, and 1870). D. in Boston Jan. 14, 1875. H. A. HARRIS.

**Sprague, WILLIAM BURR**, D. D., LL. D., jurist, poet, and author; b. at Andover, Conn., Oct. 10, 1796; graduated

at Yale College 1815; studied at Princeton Theological Seminary 1816-19; was colleague with Dr. Lathrop over the Congregational church of West Springfield, Mass., 1819-21, and pastor 1821-29; pastor of the Second Presbyterian church of Albany, N. Y., 1829-69; visited Europe in 1828 and 1836; engaged exclusively in literary work at Flushing, L. I., 1869-76. D. at Flushing, L. I., May 7, 1876. Dr. Sprague was a preacher and public speaker of special eminence; made a collection of autographs (nearly 100,000 in number) and religious pamphlets, presenting the latter to the New York State Library; won the title biographer of the Church by his most important publication, begun in his fifty-seventh year, *Annals of the American Pulpit*, sketches of the most prominent clergymen of all denominations from the earliest dates to 1855 (10 vols., New York, 1857-76); and among other works *Letters to a Daughter* (New York, 1822; republished under the title *The Daughter's Own Book*); *Letters from Europe* (1828); *Lectures on Revivals* (1832); *True Christianity and other Systems* (1837); *Life of Rev. Edward Dorr Griffin, D. D.* (1838); *Letters to Young Men* (1845); *Women of the Bible* (1850); *Visits to European Celebrities* (1855); and *Life of Rev. Jedidah Morse* (1874). C. K. HORT.

**Sprain**, or **Subluxation** [sprain is deriv. of sprain (verb), from O. Fr. *espreindre* > Fr. *épreindre*, press, wring < Lat. *exprimere*, press out; *ex*, out + *primere*, press. *Subluxation* is from *sub*, partially + *luxation*, from Lat. *luzare*, dislocate]: a stretching or wrenching of the non-osseous parts of a joint, without displacement of the bones, and either with or without lesion of ligaments or tendons. Severe sprains are sometimes as serious and lasting in their effects as dislocations, especially on account of the liability of the patient to attempt to use the part before the inflammation has wholly subsided. Perfect rest, cold or sometimes hot lotions (if the latter be more agreeable to the patient), accompanied by the use of splints for mechanical support and of opiates for the relief of pain, are required in the treatment. Revised by W. PEPPER.

**Sprat**, or **Garvie**: the *Harengulus sprattus*, a little herring of the European seas. Sprats are spiced, salted, dried, and potted in many ways, and are very good when fresh, but are generally eaten by the poorer classes. The French preserve great quantities of small sprats and sell them for sardines. Great quantities are also used for fertilizing land. The sprat is seldom over 6 inches long.

**Sprecher**, SAMUEL, D. D., LL. D.: theologian; b. near Williamsport, Md., Dec. 28, 1810; studied in Pennsylvania College and Theological Seminary, Gettysburg, Pa.; pastor at Harrisburg, Pa., 1836-39; principal of Emmaus Institute, Middletown, Pa., 1839-43; pastor Martinsburg, Va., 1842-43, and Chambersburg, Pa., 1843-49; president of Wittenberg Theological Seminary Springfield, O., 1849-74. He combined with it until 1884 the chair of Systematic Theology. Removing to the Pacific coast, he filled for a time the presidency of the college at San Diego, Cal. Dr. Sprecher's chief book is his *Groundwork of a System of Lutheran Theology* (Philadelphia, 1879). H. E. JACOBS.

**Sprée**, sprā: a river of Prussia; rises in the kingdom of Saxony, passes through Berlin, and joins the Havel at Spandau, after a course of 220 miles. At Leibsch it becomes navigable for small craft, and considerable traffic is carried on along its whole course.

**Sprengel**, HERMANN JOHANN PHILIPP, Ph. D., F. R. S.: chemist; b. at Schillerslage, Hanover, Germany, in 1834; studied at the Universities of Göttingen and Heidelberg, from the latter of which he took his degree in 1858 with the highest honor; moved to England 1859; discovered and described in *The Journal of the Chemical Society*, 1865, the method of producing vacua by the fall of water or mercury in tubes. He first drew attention to picric acid, which he suggested as a detonating charge for shells; and was the first who described and patented in England a number of so-called safety-explosives, among which are hellhoffite, oxonite, pancastite, rackarock, etc. Hellhoffite and rackarock were used by Gen. John Newton in blowing up Flood Rock at Hell Gate. C. H. THURBER.

**Sprengel's Air-pump**: See PNEUMATICS.

**Sprenger**, ALOYS: Orientalist; b. at Nassereut, Tyrol, Sept. 3, 1813; educated at Innsbruck and Vienna (1832); went to London (1836) to assist the Earl of Munster in his work, *The Military Sciences of the Mohammedan Nations*; then to Calcutta (1843) and became (1845) president of the College of Delhi, where he introduced European methods

of teaching, established a lithographic press, and issued a penny magazine, *Kiran Aladain*; was assistant resident at Lucknow (1848), where he catalogued the royal library; examiner at the College of Fort William (1850); head of the Calcutta and Hugli Mohammedan Schools; Government interpreter and secretary of the Asiatic Society of Bengal. He was pensioned in 1857, returned to Europe, and became Professor of Oriental Languages at Berne. D. Dec. 19, 1893, at Heidelberg, to which place he had retired. His most important work is *Das Leben und die Lehre des Mohammed* (Berlin, 1861-65, 3 vols.), the most comprehensive life of the prophet by a European, but written too much from the point of view of a physician. Of his *Bibliotheca Indica*, which he published in conjunction with other scholars, may be mentioned: *Dictionary of the Technical Terms used in the Sciences of the Mussulmans* (Calcutta, 1854); *Ibn Hajar's Dictionary of Persons who knew Mohammed* (1856); *Soyuti's Itkân* (1856), etc. He also published *Otby's History of Mahmud of Ghaznah* (Delhi, 1847); *Masud's Meadows of Gold* (London, 1849); *Die Alte Geographie Arabiens* (Bern, 1875). RICHARD GOTTHEIL.

**Spring** [liter., origin, source, beginning, time of beginning (cf. *dayspring*), deriv. of *spring*, to arise, take birth, rise, or origin]: the season of the year which follows winter and precedes summer. In the temperate regions of the northern hemisphere it includes, in a vague and indefinite way, the months of February, March, and April (as in Great Britain), or March, April, and May (as in North America); astronomically, it would extend from Mar. 21 to June 21. In the temperate regions of the southern hemisphere the spring months are September, October, and November. In the tropical regions there is strictly neither spring nor autumn, but only two seasons, the wet and the dry; in the polar regions, only two seasons, summer and winter.

**Spring**, GARDINER, D. D., LL. D.: clergyman; b. at Newburyport, Mass., Feb. 24, 1785; was valedictorian at Yale College 1805; studied law and taught in New Haven 1805-06; established an English school and taught in Bermuda 1806-08; admitted to the bar 1808; studied theology at Andover Theological Seminary 1809-10; and was pastor of the Brick church (Presbyterian), New York, 1810-73. D. in New York, Aug. 18, 1873. Many of his publications have passed through several editions, and have been reprinted and translated in Europe. They include *Essays on the Distinguishing Traits of Christian Character* (New York, 1813); *Memoir of Rev. Samuel J. Mills* (1820); *Fragments from the Study of a Pastor* (1838); *Obligations of the World to the Bible* (1839); *The Attractions of the Cross* (1846); *The Bible not of Man* (1847); *Discourses to Seamen* (1847); *The Power of the Pulpit* (1848); *The Mercy-seat* (1850); *First Things* (2 vols., 1851); *Contrast between Good and Bad Men* (2 vols., 1855); *Pulpit Miniaturization* (2 vols., 1864); and his autobiography, *Personal Reminiscences of the Life and Times of Gardiner Spring* (2 vols., 1866). The *Memorial Discourse*, by Rev. John O. Murray, D. D., has been published (New York, 1873). C. K. HORT.

**Spring**, LEVERETT WILSON, A. M., D. D.: teacher and author; b. at Grafton, Vt., Jan. 5, 1840; graduated at Williams College 1863, at Hartford Theological Seminary 1866; pastor of Rollstone Congregational church, Fitchburg, Mass., 1868-75; pastor of Plymouth church, Lawrence, Kan., 1876-81; Professor of English Literature, University of Kansas, 1881-86; Morris Professor of Rhetoric at Williams College since 1886; author of *Kansas* (in the American Commonwealth Series); *Mark Hopkins, Teacher* (1885). C. H. T.

**Spring-bok** [Dutch for spring-buck, so called from its habit of leaping when alarmed]: a very beautiful, active, and graceful antelope of South Africa, the *Gazella eucore*. It goes in immense herds upon the plains. Its flesh is in some estimation as food, and the hides are much sought for by tanners. This timid creature, when taken in hand young, becomes very tame and sportive.

**Spring City**: borough; Chester co., Pa.; on the Schuylkill river, the Schuylkill Canal, and the Penn. Railroad; opposite Rogersford, 32 miles N. of Philadelphia (for location, see map of Pennsylvania, ref. 6-1). It has manufactories of wood-pulp, stoves, glass, stove-moulders' facing, fire-brick, tile, paper, sash, and lumber, a national bank with capital of \$200,000, and a weekly newspaper. Pop. (1880) 1,112; (1890) 1,797.

**Springer**: a name given by sportsmen to several varieties of the hunting spaniel, used for starting birds from

ready center. The Chamber, Senate, and House have each a fine. The speaker's chair, from 14 to 40 ft., and should have a good case, a battery, but, covered box, and an auditor, graceful style of work. The Chamber is a fine, rich wood, because it gives an image while at the duty.

**Springfield**—city—capital of the State of Illinois and of Springfield County, on the R.R. and old N. W. the City and old the City, West's and St. L., the Ill. Cent., the St. L., the N. W. P., and the Western railroad. Avenues S. of the Chamber, West, and 105 miles W. of Chicago, for location, among at Illinois, and N. W. It has on the western border of an extensive granite stretching from over the river to the Chamber, and from the river to the City. The city proper is 100 square miles and surrounded by an area of 500 sq. miles. It is laid out on a simple plan, the streets and avenues intersecting each other at right angles and the business portions being surrounded with a belt of 50 miles. It contains two public parks, a city hall, and a variety of other buildings. The city is lighted by gas and electricity, and has a water supply system, a complete system of sewerage, a public fire department, and is one of the best-placed cities in the State.

**Public Buildings**—The most conspicuous of the public buildings are the State House, the U. S. Courthouse, and the County Courthouse. The State House, the U. S. Courthouse, and the County Courthouse.

State House, Springfield, Ill.

the State House, and the City Hall. The new Capitol, completed in 1857, stands in a park of about 6 acres at the south-west corner of Second and A. Morgan Streets. The ground plan is in the form of a large cross, and the architecture is of the modern classic style of architecture. The extreme width is from N. to S., including the northern portion, is 370 feet, and the extreme width from E. to W., including the eastern portion, is 200 feet. The exterior walls are of dressed Indiana limestone, and the large and lofty portions of sandstone, supported by columns of polished gray granite. The exterior is three feet above in height, with a mansard roof and two towers. Over the center rises a statue, surmounted by a banner and iron flagstaff, reaching a total elevation of 165 feet. The whole cost of the building was \$2,100,000. The County Courthouse, formerly the old State House, the cornerstone of which was laid July 4, 1837, stands on the corner of the public square in the heart of the city. It is a massive structure, built of solid limestone in the manner of a church, being longest from E. to W. The exterior is two stories high, with a basement, and is surmounted by a handsome dome. The total cost was \$240,000. The U. S. Courthouse and post office stands on the corner of First and the intersection of Sixth and Morgan Streets. It is a modern structure, three stories high, and was completed in 1850 at a cost of \$120,000. The Courthouse, the U. S. Courthouse, and the County Courthouse.

arranged and shows building. There is located the public library, containing 10,000 volumes.

**The Lincoln Monument**—Among the chief historical structures of Springfield are the Lincoln monument and the Lincoln national monument. The latter stands in the Hotel building, about 10 miles S. of the city, and is a fine structure, containing the remains of Abraham Lincoln, his wife, and his children, and his grave. It was dedicated by Lincoln to the Union, and was built by William D. Richardson, of Springfield, Ill. The structure

The Lincoln National Monument, Springfield, Ill.

walls of the terrace, pedestal, and shaft are faced with Massachusetts gray granite, and the total height of the monument is 20 ft. 5 in. It was dedicated Oct. 15, 1874. The whole cost, including the station of Lincoln and four groups of bronze statues, was \$1,250,000.

**Churches and Schools**—The churches and religious chapels of the city and suburbs number 35, classified as follows: 4 Protestant Episcopal, 5 Roman Catholic, 3 Unitarian, 1 Baptist, 5 Methodist Episcopal, 6 Presbyterian, 10 Congregational, 1 Cumberland Presbyterian, 1 Christian, 1 Hebrew, 1 United Brethren, 1 Seventh-day Adventist, and 1 Salvation Army temple. The public schools consist of a central high school and 10 large ward schools. The money expended for public school purposes for the fiscal year ending Feb. 28, 1894, was \$24,000. Besides the public schools there are Central College (Baptist), the Public Square Institute, St. Agatha's School, the Central College, the University of the City of the Sacred Heart, and half a dozen parochial schools. Among the

National Lincoln Monument, Springfield, Ill.

charitable institutions are the Home of the Poor, the St. John's, the Western Railway, and the Prince Sanatorium.

**Finance and Banking**—The great enterprise of the city for city purposes for the fiscal year ending Feb. 28,

1894, were \$314,799; the bonded debt on Mar. 1, 1894, was \$902,350; and the estimated value of all property belonging to the city \$925,000. In 1895 there were 5 national banks with combined capital of \$1,050,000, 1 State bank with capital of \$100,000, and 1 loan and trust company with capital of \$100,000. There are also 10 building and loan associations, all serial, 1 national, 9 local, with 4,088 shareholders and 41,659 shares in force.

**Business Interests.**—The census of 1890 showed 374 manufacturing establishments (representing 63 industries), with a combined capital of \$3,641,415, employing 3,269 persons, paying \$1,746,228 for wages and \$3,789,139 for materials, and turning out products valued at \$6,562,070. The principal industries, according to the amount of capital invested, were those connected with the building trades, 102 establishments, \$558,573 capital; printing and publishing, 12 establishments, \$261,031 capital; textiles, \$257,215 capital; foundry and machine-shop products, \$202,837; planing-mills, \$58,500 capital. The city is also an important coal-mining center.

**History.**—Springfield was settled in 1819 and platted in 1823, when it became the county-seat. It was incorporated as a town Apr. 2, 1832, and as a city Apr. 6, 1840. By acts of 1837 it was made the permanent seat of the State government, and the first session of the Legislature held here was convened Dec. 9, 1839. Pop. (1880) 19,743; (1890) 24,963; (1895) estimated, 30,000. JOSEPH WALLACE.

**Springfield:** city; port of entry; capital of Hampden co., Mass.; on the Connecticut river, and the Boston and Albany, the N. Y. and New Eng., and the N. Y., N. H. and Hart. railways; 98 miles W. by S. of Boston, and 138 miles N. N. E. of New York (for location, see map of Massachusetts, ref. 3-E). The city is beautifully situated, is laid out with wide streets, adorned with fine shade-trees, and is noted for the variety and taste of its private dwellings and the beauty of its churches and public buildings. There are two parks—Forest, comprising over 500 acres, laid out with ponds, carriage roads, and promenades, and Hampden, containing about 60 acres, famous for its horse-races and cycling tournaments. The steam-railways entering the city use a union dépôt erected in 1889 at a cost of \$500,000. A street-railway connects the extreme sections of the city and also extends to Chicopee, West Springfield, and Holyoke.

**Churches and Schools.**—Springfield has 39 churches, of which 11 are Congregational, 7 Methodist Episcopal, 3 Roman Catholic (also a mission), 5 Baptist, 3 Union, 2 Protestant Episcopal, and 1 each Unitarian, Universalist, Advent, Swedenborgian, Presbyterian, Lutheran, Jewish, and Spiritualist. The public-school system comprises a high school and 11 grammar, 12 primary, 7 ungraded, 3 evening, 3 kindergarten, 1 manual-training, and cooking and drawing schools, located in 31 buildings, and having 231 teachers and over 7,000 pupils. Various parochial schools have over 1,200 pupils, and private schools over 100. The city also contains a French-American (Protestant) college, the School for Christian Workers, and the International Y. M. C. A. School. The Public Library building is one of the finest in the city, and besides a library of about 89,000 volumes contains a free reading-room and a museum of natural history and ethnology.

**Finances and Banking.**—The city has an assessed property valuation of over \$56,000,000 and a funded debt of \$1,930,000, of which \$1,650,000 is water debt; deducting assets, including sinking funds, there is a net debt (1895) of \$1,577,562. The receipts and expenditures are nearly equal, over \$1,600,000 in each case. In 1895 there were 10 national banks with combined capital of \$3,500,000, 3 savings-banks with aggregate deposits of \$18,667,430, a co-operative bank with a capital of \$333,000, 2 safe deposit companies, one with a capital of \$300,000, a bank clearing-house, which in 1894 cleared \$65,033,128, and 5 insurance companies.

**Business Interests.**—The census returns of 1890 showed 681 manufacturing establishments (representing 107 industries), with a combined capital of \$10,524,457, employing 9,510 persons, paying \$5,391,005 for wages and \$7,583,487 for materials, and turning out products valued at \$16,191,456. The city has a great variety of skilled industries, extensive manufactories of railway-cars, pistols, sporting-arms, cotton and woolen goods, paper, envelopes, paper boxes, and collars, toys, needles, watches, buttons, skates, machinery, knit goods, confectionery, corrugated iron, paints and chemicals, sewing-machines, etc. The U. S. armory is located here and gives employment to about 530 men. Large additions

have been made to the shops and machinery, and the output of rifles is 100 a week. The arsenal is 200 by 70 feet, and accommodates 300,000 stand of arms. The U. S. Government building, completed in 1891 at a cost of about \$150,000, contains the post-office and the customs-office. The value of the imports in 1893 was \$107,718, and for the first quarter of 1895 nearly \$50,000, and the duty collected in 1893 \$47,710. The city has a flourishing board of trade. There are 4 daily, 8 weekly, 8 monthly, 2 semi-monthly, and 2 Sunday periodicals.

**History.**—Springfield was settled in 1636 by emigrants from Roxbury under the leadership of William Pynchon, and was first called Agawam, the Indian name for a portion of the territory occupied. West Springfield, Chicopee, and several of the neighboring towns were then included in its boundaries. In 1640 the name of the settlement was changed to Springfield in compliment to Mr. Pynchon, whose country residence in England bore that name. In 1675, during King Philip's war, the town was burned by the Indians. During Shays's rebellion in 1787 the U. S. arsenal was attacked, but the insurgents were dispersed by the State militia. Pop. (1880) 33,340; (1890) 44,179; (1894) 51,851. ERNEST M. LONG.

**Springfield:** city; capital of Greene co., Mo.; on the St. L. and San Fran., and the Kan. City, Ft. Scott and Memphis railways; 180 miles S. of Jefferson City, the State capital, and 240 miles W. S. W. of St. Louis (for location, see map of Missouri, ref. 7-F). It is on one of the highest plateaus of the Ozark Mountains, 1,450 feet above sea-level, is built in a grove of forest-trees with prairies on three sides, and is in an agricultural and lead and zinc mining region. The streets cross at right angles and are from 60 to 80 feet in width; many are macadamized or paved with brick. The city is lighted by gas and electricity, and has electric street-railways, improved water works and sewerage, and two public parks. There is a U. S. Government building which cost with grounds \$150,000, and contains the post-office, land-office, Federal courts, internal-revenue office, and signal-service quarters. Immediately S. of the city is a National Cemetery, containing the remains of 1,600 Union soldiers, and adjoining it is another cemetery with the graves of about 500 Confederate soldiers.

**Churches and Schools.**—Springfield contains 9 Methodist Episcopal churches, 7 Baptist, 6 Presbyterian, 5 Congregational, 4 Christian, 3 Roman Catholic, 2 Protestant Episcopal, and a German Evangelical. The public-school system comprises a high school with building and ground that cost \$50,000, a commodious central building, and 9 ward schools, with 65 teachers and nearly 6,000 enrolled pupils. A normal school with accommodations for 2,000 pupils was opened in 1893. There are also 3 Roman Catholic parochial schools and 2 private kindergartens. For higher instruction there are Drury College (Congregational, chartered in 1873), which in 1894 had grounds and buildings valued at \$115,800, an endowment of \$210,000, 265 students, a faculty of 12, and classical and scientific courses; a Roman Catholic college; and several academies. Springfield has a circulating library, and 3 daily and 6 weekly newspapers.

**Finance and Banking.**—In 1894 the city revenue was \$89,753; expenditures, \$80,962; bonded debt, \$188,800; and assessed property valuation, \$7,790,923. There were 5 State banks, a national bank, a private bank, with aggregate capital of \$725,000 and deposits of \$1,890,000, and 4 loan and trust companies.

**Business Interests.**—The city has a large jobbing trade, embracing the chief lines of merchandise, and covering principally Southwestern Missouri and Northwestern Arkansas. The industrial establishments comprise railway-car and repair shops, the largest wagon-factory in the State, 4 candy-factories, 4 roller flour-mills, 3 tobacco-factories, 2 iron-foundries, a furniture factory, a cooperage, and a stove-factory.

Pop. (1880) 6,522; (1890) 21,850; (1894) estimated, over 25,000. JOHN B. WADDILL.

**Springfield:** city; capital of Clarke co., O.; on the Mad river, Lagonda creek, and the Cleve., Cin., Chi. and St. L., the Erie, the Ohio S., and the Pitts., Cin., Chi. and St. L. railways; 40 miles W. of Columbus, and 80 miles N. E. of Cincinnati (for location, see map of Ohio, ref. 5-D). It is in an agricultural region, but is best known for its extensive manufacture of agricultural implements. The city has gas and electric-light plants, water-works, sewers, and street-railways, and obtains excellent power for manufacturing pur-

More than 200 are North American, fully one-half belonging to the genus *Euphorbia*, commonly represented by *E. maculata*, *E. nutans*, both prostrate spreading species, and *E. corollata*, an erect, white-flowered, weedy herb.

Economically the family is of great importance; medicines are supplied by species of *Croton*, *Euphorbia*, *Jatropha*, *Joannestia*, *Mercurialis*, *Ricinus*, *Stillingia*, etc.; caoutchouc by the latex of *Hevea*, *Mabea*, *Manihot*, and *Sapium*; food by species of *Manihot*, slender plants of the tropics, with large starchy roots, the product being known as tapioca and cassava. The box-tree (*Buxus sempervirens*) is ornamental, and its wood (box-wood) is most useful, especially for engravers' purposes. Many species are grown in conservatories, some of them resembling cactuses in their succulent, leafless stems.

CHARLES E. BESSEY.

**Spurrey**: any plant of either of the genera *Spergula* and *Tissa* (*Spergularia*), belonging to the family *Caryophyllaceae*. *Spergula arvensis*, well known to farmers of Europe and North America as a weed, is profitably cultivated in the Low Countries and Germany as a forage-plant, and its seeds yield a valuable oil and oil-cake. *S. pilifera*, a dwarf alpine plant, has been recommended as a lawn-plant in proper climates, being handsomer than grass and requiring much less care.

Revised by CHARLES E. BESSEY.

**Spur-winged Goose**: the *Plectropterus gambensis*; a goose deriving its popular name from the strong tubercle, or blunt spur, on the bend of the wing, formed by the projecting wrist-bone (radiale). The body is slender, neck and legs long; there is an excrescence at the base of the beak. The bird is about 3 feet long; chin, throat, center of breast, under side, and scapulars white, rest of plumage greenish black. It is found in Central and South Africa. F. A. L.

**Spurzheim**, sports'him, KASPAR: phrenologist; b. at Longwich, near Treves, Rhenish Prussia, Dec. 31, 1776; studied medicine at Treves and Vienna, and became a zealous disciple of Dr. Gall, whom he accompanied on his travels in Germany and France, and assisted in popularizing his phrenological doctrines by lecturing, newspaper articles, etc. In 1813 he separated from Gall, and undertook the introduction of the new doctrines in England, where he resided from 1814 to 1817, and from 1825 to 1828, and gave very popular lectures. From 1817 to 1825 he lived in Paris. In 1832 he removed to the U. S., and had just begun to excite interest when he died in Boston, Nov. 10, 1832. Among his writings are *The Physiognomical System of Drs. Gall and Spurzheim* (London, 1815); *Outlines of the Physiognomical System* (1815); *Sur la Folie* (Paris, 1818); *Essai philosophique sur la Nature morale et intellectuelle de l'Homme* (1820); *A View of the Elementary Principles of Education* (1821). See the memoir by Carmichael (1833).

**Sputum**: in pathology, the substance expectorated from the lungs. See **EXPECTORATION**.

**Spuyten Duyvil** (spī ten-dī vil) Creek [probably from the Dutch *Spuyt den Duyvil*, in spite of the devil]: the channel connecting the Hudson river with the Harlem river, and thence with the East river, on Long Island Sound. The creek forms the northern boundary of Manhattan Island.

**Spy** [deriv. of *spy* (verb), from O. Fr. *espier* (> Fr. *épier*), from O. H. Geriu. *spehōn* > Mod. Germ. *spähen* < Teuton. *speh-*: Lat. *spe* cere, look at, view]: in the laws of war, a person who goes in disguise or under false pretenses within the lines or territory of a belligerent to observe his strength and obtain information concerning his works and movements for the purpose of communicating the same to the enemy. The rules of warfare among all modern civilized nations permit the infliction of the death penalty upon spies taken in disguise within the enemy's lines. The employment of spies, however, is considered a kind of deceit allowable by the rules of war, and, notwithstanding the ignominious method of inflicting death (usually by hanging), it has not infrequently happened that men of high honor have undertaken the office. Two of the most notable instances in all history are those of Capt. Nathan Hale and Maj. André during the Revolutionary war.

Because of the treachery involved in acting as a spy all authorities are agreed that although a sovereign may hold out an inducement or the temptation of a reward to persons to engage in such service, yet the service can not be required of subjects, except, perhaps, in some singular case of the last importance. In Great Britain by the Naval Discipline Act (29 and 30 Vict., c. 109, § 6) spies can be tried by a naval court martial, and shall suffer death or other punishment.

In the U. S. the instructions for the government of the armies of the U. S. in the field provides (General Orders No. 100, sec. v., § 88) that "the spy is punishable with death by hanging by the neck, whether or not he succeed in obtaining the information or in conveying it to the enemy."

Exactly what acts shall bring a person within the definition of a spy is not definitely determined, nor when he ceases to be a spy after once having had that character. In the Franco-German war of 1870 the Germans claimed that persons crossing their lines in balloons were spies; but this is not in accordance with the treatment of the subject of spies in the rules proposed at the Conference of Brussels in 1874 (Project of an International Declaration concerning the Law and Custom of War, Arts. 19-22), which expresses the opinion generally accepted among the nations of Europe. See Vattel's *Law of Nations*; Kent's *Commentaries*; and Halleck's *International Law*.

F. STURGES ALLEN.

**Squall** [Mod. Lat., from plur. of Lat. *squālus*, a kind of sea-fish]: See **SHARK**.

**Squalls**: bursts of wind, usually of brief duration, and when accompanied by the proper precipitation called rain-squalls or snow-squalls. They are of many varieties as to origin. One of the commonest is the falling wind which descends on the water from mountainous coasts. On the northwest coast of Lake Superior they descend from the bluffs and low mountains only a few hundred feet high, yet with such violence and suddenness in calm, warm weather, and in the heat of the day, that they are very dangerous to sailing-vessels. In the Aleutian islands they often descend the mountains behind a head of white wool-like fog, and are therefore called "woollies." The papagayos of Lakes Nicaragua and Managua, and of the Papagayo Bight on the west coast of Nicaragua and Costa Rica, are of the same character, but of longer duration. They usually fall on the ocean at from 10 to 20 miles from land, and the navigator must keep within 10 or beyond 40 miles from shore if he wishes to escape them. Of the same character also are the nevaños, a falling diurnal wind in Ecuador and Peru, when the air descends on the plains from the snow-fields of the higher mountains. Of another type is the derecho of the western parts of the U. S., an occasional non-vortical wind which spreads in a fan shape as it advances from the N. W. These squalls are often mistaken for tornadoes, which are vortical local storms. The white squalls of the tropical seas on the west coast of Africa are sudden and furious bursts, whose approach is indicated by an advancing but harmless-looking white cloud. MARK W. HARRINGTON.

**Squarclione**, squāar-chō'nd, FRANCESCO: painter; b. at Padua, Italy, 1394. His love of art led him to travel much in Greece and Italy, where he became acquainted with the masterpieces of ancient sculpture. He then formed a collection of busts, torsos, and bas-reliefs, with which he adorned his studio, and opened a school which became very popular, and in which Andrea Mantegna studied. He employed the help of his assistants to such an extent that only one picture exists in Padua which is supposed to be entirely his work, viz., the *St. Jerome and other Saints*, painted for the Lazzare family and placed in the Carmelite church. D. at Venice, 1474.

**Square Root**: See **ROOT**.

**Squares, Method of Least** [*square* is from O. Fr. *esquarre* > Fr. *équerre*, carpenter's square, deriv. of *équarrer*, as Ital. *squadra* of *squadrare* < Lat. *\*exquadra* re, make square; *ex* + *quadra*, a square]: a process used for the purpose of obtaining the most probable value of a quantity from a series of observations. In all measures, from the ordinary rude weighings and measurements of agriculture and commerce up to the most refined astronomical work, there is a liability to error which can not be avoided. An ordinary scale, for instance, can be used to measure down to a sixteenth of an inch; that is, if carefully used, its results will be correct to that limit. The level of a transit-instrument can make its measures, when used with care, to a ten-thousandth of an inch or even less; but in this case the hundred-thousandths will be uncertain. An ordinary observer notes his time to minutes only, and is likely to state the time incorrectly to the extent of at least half a minute: the man who is trying a fine watch will note its errors to seconds, or even half seconds; the astronomer uses tenths of seconds in his rough data and hundredths or thousandths in his calculations, but even here there is always uncertainty in the fractions of a second.

Consent, however, or non-consent of the same thing never agree in reality, and as to the individual franchise, how shall the individual be distinguished from the social system? The ordinary experience of mankind has shown that it is best to "let the oil outgo."<sup>1</sup> When, for instance, two equally good inventors measure a field a little differently, the field owner of that result is taken. The average price of commodities are taken for their real prices, or at least for a better estimate of their true value than the extreme prices which may be offered by temporary disturbances. The whole business of commerce rests upon this law of averages.

The "method of least squares" is the application of this law to the results of physical measurements especially in astronomy and geodesy. The mathematicians whose names are most prominently connected with this Legendre, Gauss, Bessel, and Kalker, Laplace and Gauss seem to have discovered it independently. A short sketch of the history of this method will help its explanation. Before the method of least squares as we now have it was discovered, the method of average, in the arithmetical mean, was applied to all physical measurements which give a direct result. But in measuring the things to be found, it can not always be directly measured, but must be indirectly inferred from measurements of other things. The observations upon the transit of Venus afford an illustration. Here the main thing to be found is the solar parallax; the thing directly observed is the planet's ingress upon or egress from the sun. The time of this depends upon several unknown quantities, of which the solar parallax is one, and also the unknown times of conjunction, and the unknown distance of the planet's and sun's center at that time, as well as the apparent angular diameters of planet and sun. Each observation, then, gives an equation of condition between these five unknown quantities, and at any one place four observations of constants are made. At thirty stations there would be 120 equations for the unknown quantities, if the last five of these were selected, a good value of the solar parallax would be obtained, but many thousand good combinations can be made, each of which gives a different result, owing to the errors of the observations. Now, then, can such a combination be made as to answer to the average in more direct measurements, or, to express it mathematically, does not the simplest equations of condition be combined so as to give the best possible result? The mathematical problem here treated is analogous to the combination of ordinary scientific evidence in a judicial case in the courts of law - where the result here needed is one episode of mathematical reasoning, as in the possession of damages, the average is taken, but where not, the evidence is reconciled as well as possible. Gauss has shown that in simple cases the ordinary law of averages is justified, and that in complex work like the transit of Venus reductions, the following rule is to be used, which is the more general form of the same law: "In treating observations of equal precision the unknown quantities are to be so determined that, after allowing for constant error, the sum of squares of the remaining errors shall be the least possible." This is the "method of least squares." Its practical working is easy after the data are put into proper shape, and the advantages are so great that it is very largely used. It affords a thorough treatment upon one's own work and that of others, and for this reason is in great favor where the observers are good delicate men, and careful ones, especially in Russia, Germany, and the U. S.

Revised by S. Newcomb.

Squaring of the Circle: See QUADRATURE OF THE CIRCLE

**Squash** (from Massachusetts Ind. *squash*, plur. of *sag*, green, now) is a name applied in North America to fruits and seeds of *Cucurbita* indigenous to the land or summer varieties of *C. pepo*, and also sometimes to varieties of *C. maxima*. It is a name various as to the application of the name, but is belonging to *C. maxima* rather than to the others. (See *Butternut*.) The fruits of *C. aurantia* have soft, cylindrical seeds which are not inflated at their insertion, the flesh is dry and unappetizing, and the seeds are large and not thin-shelled. Varieties of this species are Hubbard, Boston Marrow, the Turkish, Mangel-wurzel, and the like. L. H. B.

**Synanthus lugens**—The *Amorus* feeding a hemipterous insect, and *Amorus*, but the *Amorus* upon a peach and plum-like vine, to the west of the *Amorus*. It is a native of the north, but about three-quarters of an inch long, and of a dark brown. It emits a powerful and offensive odor. The striped markings on the *Amorus* contain a taste of the fruit.

*Chrysomelidae*, a much smaller but even more destructive genus, which infests *monardella* from almost all kinds in the U. S. As in the case of these beetles, the most destructive while the plants are young; and the *Chrysomelidae* should be protected by a spray composed with molasses, or powdered sulphur and castor-oil, or by freely sprinkling upon the plants, and soil to invade the domains of such, particularly that of the striped bug. The use of salt in the mature is not at all with respect to the bug, and is injurious to the plant.

Revised by J. S. Lawrence

**Squash Family:** the Cucurbitaceae. See the article on the Gourd Family.

**Squatter Sovereignty:** a term used in the published history of the U. S. to indicate the principle of leaving to the settlers within the Territories of the U. S. the decision of the question whether slavery should be permitted by the territory before it is adopted when the Territory becomes a State. See *KANSAS (History)* and *UNITED STATES (History)*.

Synthesizing: So, Warrick,

**Squid:** a popular name for many deep-sea cephalopods, particularly those of the family *Teuthidae* (cuttlefishes), but has extended to the *Sepiidae* in some localities, and even to the pulpers or *Idoteuthidae*. These squids proper are found in nearly all seas, they form an important part of the food of many fishes and crustaceans, are extensively used as bait, and in many countries are much used as food. (See *Calamagrostis*, *Callinectes*, *Platys*, *Squilla*, *Homarus*, etc.) There are several true squids which are common on the W. S. coast. Revised by D. S. JORDAN.

**Squire, FREDERICK** (Frederick Archibald), b. at Bethlehem, N. Y., June 17, 1821. He received the ordinary education of a farmer's son, was a school teacher, and subsequently editor of country papers in New York and Ohio, and studied engineering. He was early interested in Indian antiquities and in 1841-42 made, with Dr. E. H. Davis, an investigation of the mounds of Ohio and the neighboring States; the results were published in the *Smithsonian Contributions to Knowledge* (1844) as *Ancient Monuments of the Mississippi Valley*. Similar investigations in his native State resulted in the *Antiquities of the State of New York* (1851). In 1849-50 he was special agent of the United States Commission, examining treaties with several of the States, and in 1851 he was engaged to examine the title for a proposed interesting railway in the same region. He published *Norwegian, its People, Monuments, etc.* (1852); *Wanderer, or Adventures on the Mexican Coast* (first published with the pseudonym *Samuel A. Bard*, 1856); *The States of Central America* (1857), and several other books and reports in English and French. His work on *The Sacred Symbol* (1859) attracted wide attention. In 1853-55 he was U. S. commissioner to Peru, and his investigations of the Incarian antiquities were the most important and exact that had been made up to the time. Returning, he took up his residence at New York, where from 1858 he was corresponding of Honduras. He was prominent in organizing the American Anthropological Society, and was its first president in 1871. The French Geographical Society voted him its gold medal, and he was a member of many other foreign and American learned societies. Several years were spent in the preparation of a work on Peru, and it was nearly ready for the press when, in 1874, a severe illness incapacitated him for continuous mental labor. The work was published in 1876, and is one of the most important contributions to our knowledge of Peru. D. in Brooklyn, Apr. 17, 1898. Besides the works mentioned, he was the author of numerous scientific papers and magazine articles. Many of his books were translated into Spanish and French. **HEBERT H. SMITH.**

**Squill** [yud O. Fr. from Lat. *scylla*, *scilla* = Gr. *σκίλλα*]: a drug made from the bulb of *Scilla maritima* (maritima), a perennial plant of the family Liliaceae, growing on the Mediterranean coast. The bulb is pear-shaped, of the size of a nut + flat or even larger. It is made up of concentric scales, like other toruloid bulbs, of which the outer are dry and dark colored, but the inner fleshy and juicy, and rather colorless or of a pale rose-tint. For use in medicine the bulbs are dried and sliced and after the varieties known as white and red squill according to the tint of the bulb. Squill has little smell but a acid, mucous, bitter taste. It contains a good deal of murexide but there is still much uncertainty concerning the nature of the active principles. A resin and a bitter principle probably have to do with the medicinal effects. Squill has been known as

medicine from a very remote period. It is an acrid irritant, affecting the mucous membranes and glands, and in large dose causes vomiting, purging, strangury, and may even prove fatally poisonous. Its medicinal use is from its producing, in small dose, an increased flow of urine, and also modifying in some unknown way the morbid condition of a mucous membrane affected with catarrh, and especially of the bronchia.

**Squilla**: one of the stomapod crustaceans. See the article on the STOMAPODA.

**Squinting**, technically termed **Strabismus** [Mod. Lat. from Gr. *στραβισμός*, a squinting, deriv. of *στραβός*, distorted, squinting]: the condition of vision when the visual axis of one eye is deviated from the point of fixation. The eye whose visual axis is directed to the object fixed is termed the *fixing eye*; the other is called the *squinting* or *deviating eye*. The deviation may be inward, *convergent strabismus*, outward, *divergent strabismus*, upward or downward, *vertical strabismus*. In convergent squint the visual line of the squinting eye is deviated inward, and intersects that of the sound eye at some point nearer than the object fixed; in divergent squint it lacks the necessary movement inward to intersect that of its fellow at the point of fixation, and hence it deviates outward. Strabismus may be paralytic, or concomitant.

(1) In *paralytic squint* the deviation is caused by a paralysis of one of the muscles of the eyeball. The normal position of the eye and the correct direction of its visual line depend upon the tonicity of the four straight muscles, attached one above, one beneath, and one on each side of the eyeball. If one muscle is paralyzed, the eye is deflected to the opposite side by the stronger or intact muscle. Generally with paralytic squint, in addition to the deviation, there is loss of movement in the direction of the action of the affected muscle. Thus, if the outer straight muscle of the right eye were paralyzed, the affected eye could not move toward the temple on that side, and would be turned inward by the action of the inner straight muscle which is unaffected—that is, there would be a convergent squint. There is also generally double vision, because the images from an object do not fall upon identical points in the two retinas, and hence are no longer fused, as is the case when the eyes are normally moved by the muscles. Paralytic squint is caused by diseases of the brain, meningitis, and spinal cord, especially locomotor ataxia, certain general diseases like syphilis, rheumatism, diphtheria, diabetes, etc.; poisons, e. g. lead, and injuries.

(2) In *concomitant squint* the deviating eye is able to follow the movements of the other in all directions. The squint may be either periodic or permanent, and it may affect one eye or it may alternate. The average age for the appearance of concomitant squint is about four years, being usually first noticed when the child is beginning to learn to spell or read with small letters. There are a number of causes for concomitant squint, but the most important is a disturbance in the relation of the power of accommodation in an eye to the power of convergence, i. e. of bringing the eyes closer together. When the eye is far-sighted (hypermetropic) to a given degree, i. e. when it has a low refractive power, a short antero-posterior diameter, and the rays of light are not focused on the retina, it requires an accommodation, i. e. power to adjust itself for different distances and objects, of an equivalent degree to neutralize it, the visual lines being parallel. Generally, however, some convergence will accompany the effort of accommodation. The point of convergence is then nearer than the point for which the eye is accommodated, or, in other words, there is a convergent squint. Far-sightedness is consequently often accompanied by convergent squint. In near-sightedness, on the other hand, or in that condition in which there is a high refractive power and a long antero-posterior diameter, the visual lines often intersect at a greater distance than the point for which they are accommodated, and there is divergent squint. In a great majority of the cases of permanent squint there is amblyopia or imperfect vision of the squinting eye. Two views have been held in regard to this amblyopia, one being that it is due to lack of use on the part of the squinting eye, i. e. that the squint causes the amblyopia; the other that it is congenital and depends upon an imperfect development of the centers of vision in the brain, i. e. that the amblyopia causes the squint. The double vision, which is so marked a feature in squint when it is caused by paralysis, is usually absent in concomitant squint, because the eye involuntarily

suppresses the false image, or else has learned to disregard it. In rare cases squint is due to spasm of the internal straight muscle. In paralytic squint the treatment consists in finding the cause and applying the proper remedies. In the low degrees, especially of the periodic varieties of concomitant squint, the eyes may often be straightened by prescribing the proper spectacles to correct the error or refraction which is at the bottom of the trouble. When the squint is marked and persistent it calls for operation: Incision of the ocular conjunctiva or mucous membrane, hooking up the tendon close to the cornea, and severing it. Very young children should not be operated upon. It is better to wait until the sixth or seventh year. G. E. DE SCHWEINITZ.

**Squirrel** [from O. Fr. *esquirel* > Fr. *écureuil*: Span. *esquirol* < Lat. *\*scurius* for *sciurus* = Gr. *σκίουρος*, squirrel]: any one of certain species of the family *Sciuridae*. The name is more properly applicable to the slender arboreal forms constituting the genus *Sciurus*. These are of moderate size or small, have a rather slender head, no cheek-pouches, rather long ears, no lateral wing-like extension of the skin, a large bushy tail, and the teeth are, as in all the other genera of the family, 24—viz., M.  $\frac{3}{1}$ , I.  $\frac{1}{1}$   $\times$  2—but the foremost upper molars are often early deciduous, and when present very small. The genus grades into *Tamias*, or the chipmunks, and *Spermophilus*, or the ground-squirrels. There are about 150 species, and representatives are found in almost every region, Australasia and Polynesia, the southern extremity of South America, and the West Indies being the only considerable bodies of land in the temperate or tropical zones destitute of them. Eighteen species, with sixteen geographical races, or sub-species, are found in North America N. of Mexico. In time they existed, according to some authors, as early as the Eocene Tertiary, but the affinities of those early forms are doubtful. In habits the living species are all essentially similar. Most of their life is spent among the trees, and they exhibit great agility in running up the trunks and leaping from branch to branch. Their principal food consists of the nuts of trees, and in nut-bearing forests they are especially to be found; they also eat to some extent the larvæ of insects, and attack the nests of birds for their eggs, and even for their young. Their favorite attitude in eating is to sit on their haunches, with their tail thrown upward on the back, and holding the eatables in their paws. In the colder countries they lay up stores of provisions in holes and nooks in or near the trees in which they live. They are mostly readily tamed, and are generally kept in cages with revolving wheels or treadmills, wherein they exercise.

**Squirrel-corn**: See DICENTRA.

**Squirrel, Flying**: See FLYING SQUIRREL.

**Srinagar**, or **Serlinagur**: capital of Kashmir, situated in a broad, marvelously beautiful valley at an elevation of 5,276 feet, and with a mean temperature of 56° 8' F. (see map of N. India, ref. 3-D). It is built on both sides of the navigable river Jhilam, from which numerous canals, spanned with light wooden bridges, branch off, the lively traffic by boat reminding one of Venice. The most remarkable building is the palace of the maharajah; it is called the Shergarh (citadel), and a large, beautiful flight of stairs leads from it down to the river. Close by the city is Lake Dal, which boasts of the far-famed isle Chinars (*Platanus orientalis*). Vegetables are raised here on floating rafts called gardens. About 21 miles N. W. of the city is Wular Lake, which covers 103 sq. miles. A small steamboat plies between the two lakes. Pop. (1891) 118,960, mostly Mohammedans.

**Staal**, MARGUERITE JEANNE CORDIER DE LAUNAY, BARONESS de: memoir writer; b. in Paris in 1684, the daughter of a poor painter; was educated in a convent at Rouen; became maid to the Duchess of Maine; took part in Cellamare's conspiracy for depriving the Duke of Orleans of the regency, and was imprisoned in the Bastille 1718-20; married afterward a Baron de Staal, who held a company in the guard of the Duke of Maine, and spent the rest of her life at the ducal court at Sceaux. D. in Paris, June 15, 1750. Her *Mémoires* were published in 1755, and republished in 1846 and 1878; her letters appeared in 1806, her *Œuvres complètes* (2 vols.) in 1821. Her *Mémoires* and letters have considerable interest to the student of history. See Sainte-Beuve, *Portraits Littéraires*.

**Stabat Mater** [Lat., *stabat*, was standing, third sing. imperf. indic. of *sta're*, stand + *ma'ter*, the mother]: the first

(1807); and by a wide range of intellectual view and just and profound ideas, which some have denied her the credit of originating, but which she at least grasped, communicated, and made available. These are exhibited especially in *De la Littérature considérée dans ses rapports avec les institutions sociales* (1800); *De l'Allemagne* (1810); and *Considérations sur la Révolution française*, her last work, published by her son in 1818. *De l'Allemagne* was of great importance in stimulating the influence of German thought and literature in France by giving the French public a more complete and sympathetic revelation of Germany than it had ever had. Other works are *Lettres sur les écrits et le caractère de J. J. Rousseau* (1788) and *Dix années d'exil* (posthumous). Her son published her *Œuvres complètes* (17 vols., 1821). See Lady Blennerhasset, *Frau von Staël* (3 vols., 1888-89); A. Sorel, *Madame de Staël* (Paris, 1890).

A. G. CANFIELD.

**Staff:** an exterior covering for buildings, resembling plaster or stucco, first used at the Paris Exposition of 1889, and employed for most of the buildings and exterior decorative work of the Columbian Exposition at Chicago in 1893. It is made of hydraulic cement, sand, and a binding material of jute fiber.

M. M.

**Staffa:** a small, uninhabited island of Argyleshire, Scotland; 6 miles W. of Mull; celebrated for its curious caverns, among which that called FINGAL'S CAVE (*q. v.*) is the most remarkable. Among the other caves are the Cormorant and the Clam-shell. The greater part of the coast is girt with cliffs from 84 to 112 feet high. In the N. E., however, in the lee of the prevailing winds, is a tract of low shore stretching out in beaches and forming a landing-place, and the interior table-land is covered with rich soil and luxuriant grass, which feeds a number of black cattle.

Revised by M. W. HARRINGTON.

**Staff and Staff Schools:** the assistants of the general-in-chief of an army and of his generals, and the institutions in which they are trained for service on the staff. The term staff as commonly used includes (1) the heads of departments (such as artillery and engineers, military law, medical, quartermaster, pay, etc.), (2) the personal staff (including aides, orderly officers, etc.), (3) adjutants, and (4) a special body of officers, intrusted with duties connected directly with military operations, entitled the *general staff*.

The general staff has been universally recognized as an essential part of modern army organization. Its purpose is to convert the ideas of the general commanding into orders, not only by conveying them to the troops, but far more by working out all the necessary matters of detail (Clausewitz); and to watch over and preserve the fighting condition and material welfare of the troops (Schellendorf).

**Germany.**—All European states since the great success of the Prussian armies in their contests with Denmark, with Austria, and with France, in the campaigns of 1864, 1866, 1870-71, have made the Prussian staff system in some degree their exemplar. The origin of a general staff is probably to be found in the Swedish organization of the seventeenth century (then regarded as a model), and traces of it (no doubt taken therefrom) are found in the army of the great Elector of Brandenburg, who had, in 1655, two quartermaster-generals, officers doing special duty other than the direct command of troops—the germ of the German general staff of to-day. In 1657 were added to the general staff a field-marshal, a commissary-general and his assistant, 2 adjutant-generals, a judge-advocate, a provision-master, a quartermaster, a paymaster, a chaplain, a surgeon and an apothecary, a wagon-master, a provost-marshal with 3 assistants, and 11 clerks.

Frederick the Great had few staff officers. This great captain was not only his own chief of general staff, but he often assumed the functions of a staff officer of an inferior grade. The staff of the quartermaster-general then had merely a nominal existence. In 1741 there were 5 colonels, 4 adjutant-generals, 1 brigade-major, 5 majors (wing-adjutants), 1 quartermaster-general with 1 colonel and 2 majors as assistants, and 9 colonels and lieutenant-colonels of the army on general staff-duty. The king's instructions to his quartermaster-general, dated 1757, contain the principles of the construction, attack, and defense of fortresses and fortified camps; reconnaissance duty was performed by his engineers; the captain of the guides conducted columns of route, as no maps then existed, while the brigade majors regulated the guard duties in camp. In 1796 the survey of the kingdom was intrusted to the quartermaster-general's staff.

These were the beginnings of the general staff, but it was not until 1806 that Col. von Massenbach gave it a definite organization, and had assigned to its officers their proper duties, which, in general outlines, are still retained.

After the destruction of the Prussian army by Napoleon in the campaign of 1806, Col. von Scharnhorst in 1808 became lieutenant quartermaster-general of the Prussian army, with rank of major-general. His staff consisted of thirty-four officers in all; one officer was attached to each brigade, and one (sometimes two) to each corps. After 1815 the organization of the staff, which had rendered distinguished and important services during the closing campaigns against Napoleon, was seriously studied. A part of its officers, placed under a special chief as the *great general staff*, was assembled at Berlin, while its other officers, doing staff duty in the general and divisional commands, were in direct contact with the troops. The general staff was under the Minister of War till 1821, when the king named Lieut.-Gen. von Mueffling chief of the general staff, which then acquired an independent position, taking its orders directly from the chief of the state and commander-in-chief of the army—a position it retains. To this independence of all subordinate authority the Prussian staff attributes its ability to render the services in its later campaigns which have placed it as first among military organizations. Lieut.-Gen. von Mueffling was succeeded in 1829 by Lieut.-Gen. von Krauseneck, who was followed in 1848 by Lieut.-Gen. von Reyer, on whose death, in 1857, Gen. von Moltke became chief of the general staff. The part played by this general staff in changing the map of Europe makes its history one of great interest.

The campaign of 1866 showed the necessity of having ready at the moment of mobilization of the army a great general staff, capable of being doubled, and of leaving behind it when the army takes the field a sufficient number of trained staff officers to make sure of the means and measures of military transportation, and to insure the continuance of the supplies necessary for the army of operations. In 1867 a royal order established the staff on the following footing: *Principal list:* chief of general staff of the army; chiefs of division at the offices of the great general staff; chiefs of staff of the army-corps, etc.; total, 88 officers. *Scientific list:* 21 officers at the office of the great general staff. Total, 109 officers, 46 belonging to the great general staff.

At the breaking out of the war of 1870 the German army contained 200 staff officers, which number was considerably increased in the course of the campaign. In 1891 the general staff proper consisted of 186 officers—127 attached to the staff of the corps, divisions, etc., 49 to the great general staff of Berlin, 10 to that of Munich; the auxiliary staff (*scientific list*), officers simply detached from their regiments and doing duty under the great general staff, consists of 68 officers. Besides these, the general staff comprises military *attachés* (about 10), directors of military schools (about 20), commissaries of railroads residing at important railway centers (25), and officers undergoing probation as staff officers (80). Moreover, there are some 400 adjutants, selected and assigned to duty by the chief of the general staff, so that there are about 800 officers employed on general staff duty.

The work of the great general staff is distributed to separate divisions. The chief of the general staff directs the whole. In his office, under direction of his aide-de-camp, questions relating to the personnel of the staff, to its organization and administration, are considered. The work of collecting military information, domestic and foreign, the use of railways, the pursuit of military science, preparation of maps, etc., are distributed to various sections, grouped according to their work or the countries to whose study they are devoted. The staff is divided into three sections, whose duty is to study attentively all military events, domestic and foreign; to keep themselves acquainted with the changes affecting the organization, recruiting, arming, and equipment of armies; to study the military geography of different countries, the establishment or demolition of fortresses, the development of the network of roads, railways, canals, etc. Each is directed by a chief. Several staff officers, and a number of officers ordered on staff duty and charged with the special study of military questions in different countries, are under the orders of each chief.

The fourth section is that of railways. This section is charged with all that relates to military transportation. It should know the connections of the railways at home and abroad, the equipment and rolling stock; and it elaborates

the great schemes for army transportation by railway. In consequence of the great number of officers needed to manage the movement of a great army by railway, as many officers as possible are from time to time attached to this section with a view to their instruction in these duties.

In the scientific corps of the staff are the officers who have charge of the section of military history, of the archives, and of the library. In this scientific corps belong also the section of geography and statistics and the preparation of military maps of foreign countries. The general service of charts belongs, under a chief of the trigonometric survey, to another part of the great general staff.

The officers of the general staff are selected from the ablest graduates of the military schools after a certain term of service in the line. They serve on the staff in greater number than can possibly become permanent staff officers. They return to the line and serve a term with their regiments. As vacancies occur in the permanent staff, they are filled by selection, at the discretion of the chief of the general staff, from those officers who have, while under his eye, given proof of greatest capacity and devotion.\*

**France.**—In the French army, previous to 1890, the general staff was a separate corps of officers, but since that year it has been merely a service to which officers of the line are detailed for a term of years, these officers still belonging to their respective arms and being regularly promoted therein. By the law of June 24, 1890, the number of officers in the general staff was limited to 640, comprising 30 colonels, 40 lieutenant-colonels, 170 majors, and 400 captains, under whose orders are placed 180 archivists, constituting a special corps of officers, employed in clerical work and in keeping the records.

In time of peace the general staff comprises (1) the military household of the president; (2) the special staff of the Minister of War; (3) the general staff of the army; (4) the staffs of the military governors of Paris and of Lyons; (5) the staffs of army-corps, divisions, and brigades; (6) the staffs of territorial divisions and subdivisions; (7) the staffs attached to fortified places; (8) the staffs of marshals of France and general officers specially employed; (9) military *attachés* abroad; (10) the staff of the commanders of the artillery and the engineers.

The supply of officers for the staff comes mainly from the superior war school (see MILITARY ACADEMIES), but officers who have not gone through this school are allowed to compete for a staff certificate at examinations held concurrently with the final examination at this school. The officers who pass serve a probationary term of two years in the staff, after which the best are selected as required.

The personnel of the staff is brought up to the war footing by calling in all officers possessing the staff certificate who are in the active army, and by recalling all certified officers and archivists belonging to the reserve or the territorial army.

The general staff of an army-corps is composed of (1) 1 chief of staff (general or colonel), 1 colonel or lieutenant-colonel, 2 majors (sometimes 3), 3 captains, 2 orderly officers, 2 archivists and 8 secretaries in time of peace; in time of war, of 14 officers and 66 men; (2) the staff of the artillery, 8 officers and 19 men; (3) the staff of the engineers, 4 officers and 8 men.

A division has, in time of peace, 1 chief (lieutenant-colonel or major) and 1 orderly officer (captain or lieutenant); in time of war, 1 captain or lieutenant, and 30 men in addition.

A brigade has, in time of peace, 1 orderly officer (lieutenant or captain possessing the staff certificate), and 1 corporal or private as secretary; in time of war, 1 lieutenant of the reserve as orderly officer, and 9 men in addition.

The artillery and engineers have also a special staff, that of the former comprising 310 colonels, lieutenant-colonels, majors, and captains, also the second lieutenants of the school of application; that of the latter comprising 486 officers. The duties of the former consist in superintending the various establishments of that arm and supplying the troops with ammunition; those of the latter in constructing and repairing fortifications and military buildings, directing the engineer schools, military telegraphy, and the military pigeon-houses.

**Russia.**—The officers of the general staff in Russia form a special corps, and are exclusively graduates of the general staff school (Nicolas Academy) at St. Petersburg. Entrance to this school is by competitive examination, open to officers

of all arms who have served at least three years; the course is two and a half years, the last six months being devoted entirely to practical work in the field; about 80 students enter every year and about 60 graduate. Upon graduation the 30 best enter the general staff. There is also a geodetic subdivision of 20 officers, who, after a two and a quarter years' course here, have a two years' course at the observatory at Pulkowa and then enter the general staff. The general staff comprises about 480 colonels, lieutenant-colonels, and captains, who do duty in the different bureaus of the great general staff at the office of the Minister of War, or in the military schools, or in the general staff of the generals exercising command. Before being promoted they are always required to have served with troops, exercising certain commands, so that a number is always detached on such duty. The corps also comprises about 80 general officers doing general staff duty and about 170 on special duties of various kinds. Topographical work is not done by the general staff, as in other armies, but by a special corps of military topographers, about 450 officers; and there is still another corps, doing duty related to that of the general staff, viz., the *Feldjaeger*, about 45 officers, selected from various arms, for reconnaissance work, carrying important orders to a distance, etc. General officers also have their aides-de-camp, selected from the officers of their commands, and simply detached, but not considered part of the general staff.

**Austria-Hungary.**—The general staff of Austria-Hungary, suppressed as a special corps in 1871, but re-established as such by the law of Dec. 28, 1875, comprises on the peace footing 260 officers, besides a number attached for temporary duty. The corps proper is a closed corps, and an officer once admitted remains a part of it, whether he afterward does duty with troops or continues on general staff duty, but it is open for admission to all officers up to the rank of major.

Before entrance lieutenants are generally required to pass at the staff school (*Kriegsschule*),\* located in Vienna. Admission to this school is by competitive examination, open to first or second lieutenants of at least three years' service, who are under thirty years of age and unmarried; each year about 45 enter. The course is two years, terminated by an examination, at which other officers who have not taken the course may also compete. Those who pass are assigned to the staff for a probationary tour of duty as required; they number usually about 135. If acceptable they become captains of the general staff; if not, they return to their regiments. Majors may come directly from the line, either by passing a special examination or by selection of the chief of the general staff. Promotion in the corps is by seniority.

Employed in the bureaus of the general staff of the army are about 30 officers, taken either from the retired list or from a special body of officers, not fit for active service, but who can be utilized for sedentary duties, called the *Armeestand*, who have their own uniform and are promoted among themselves. Besides these about 100 officers, detached from their regiments, are detailed on topographical work. The total on general staff duty is about 700.

**Italy.**—General staff duty in Italy is performed by a special corps of about 150 officers, drawn from the captains, graduates of the general staff school, who have commanded a company, squadron, or battery for at least one year. Upon promotion they generally return to the line, and are not again recalled to the general staff as majors until after serving another year with troops; but captains who served two years before admission may be promoted in the corps.

There are also about 120 officers temporarily attached to the general staff, including those graduates of the staff school (usually about 24) who are making their trial tour. Generals in command, besides their general staffs, have also orderly officers, selected from among the troops of their command and detailed for a term not exceeding three years; brigade commanders have neither general staffs nor orderly officers, but aides-de-camp are detailed to the brigade (not to its commander) by the Minister of War. The number of orderly officers and aides-de-camp is about 100. There are, therefore, about 370 officers on general staff duty.

\* Austria-Hungary also has a military orphan asylum at Fischau, 4 lower military real-schools at St. Pölten, Güns, Eisenstadt, and Koechbau, a higher military real-school at Mährisch-Welskirchen, 19 infantry cadet-schools, 1 cavalry, 1 artillery, 1 engineer, and 1 pioneer school, the military academy (for cavalry and infantry) at Wiener-Neustadt, the technical military academy (for artillery, engineers, and pioneers) at Vienna, the higher artillery and engineer course, and the field officers' course, besides regimental and other schools for soldiers and schools of practice and application for officers.

\* Saxony has its own cadet corps, and Bavaria has its own cadet corps, war school, artillery and engineer school, and war academy.

**Great Britain.**—It can scarcely be said that there is any British military staff as a separate and distinct corps of officers. The British War Department is dual, embracing both political and military officers. Command and administration are separate. The War Office and the Horse Guards, long distinct, were united into one department by act of Parliament in 1870. The general commanding-in-chief was thus brought into the War Office, which is under the Secretary of State for War. The latter is alone responsible to Parliament, while the former is subordinate, and can exercise his authority only under approval of the secretary; in practice, however, the secretary concerns himself with the army estimates only, and exercises merely a general control over the general-in-chief, who has immediate direction of all military affairs; two Under-Secretaries of State are placed immediately under the Secretary of State for War—the parliamentary secretary and the permanent under-secretary. The first retires at a change of ministry, and assists his chief in Parliament; the second does not sit in Parliament; he has the real direction of business, and does not go out with the ministry.

The military affairs come under the military department of the secretary, and are arranged under several bureaux: (1) That of the military secretary, dealing with matters relating to officers personally, such as orders, leaves of absence, detail to staff-duty, etc.; (2) that of the adjutant-general of the army, concerned with all questions of recruitment, organization, mobilization, instruction, and discipline; (3) that of the quartermaster-general, comprising clothing, equipment, quartering, food, forage, and transportation; the quartermaster-general has control of the commissariat and transport corps and the pay department; (4) that of the inspector-general of engineers and fortifications; (5) that of the director-general of artillery; (6) that of the director of military intelligence; (7) the director of military education, surgeon-general, chaplain-general, and principal veterinary surgeon.

The yearly army estimates and administrative matters are under the financial department, at the head of which is the financial secretary (a civil officer), under whom are four bureaux: (1) The accountant-general (specially charged with the army estimates); (2) the director of contracts; (3) the director of clothing; (4) the director of ordnance-factories.

There are two branches of general staff service in England, viz., the staff of the commands and the personal staff. The former comprises those officers who form the staff proper of general officers, those on topographical work, and those sent on special missions. The staff of a general officer is divided into two distinct bureaux, the adjutant-general's and the quartermaster-general's. In brigades a single officer, called brigade-major, combines the duties of both.

The personal staffs of generals comprise aides-de-camp and military secretaries.

The officers of the staff are taken exclusively from the regular army, and should have spent two years at the staff college or passed the final examination for graduation at that college. A condition of eligibility to examination for admission to the staff college is five years' service in the army. Every officer who presents himself for the graduating examination at Sandhurst Staff College (see MILITARY ACADEMIES) must have had seven years' service.

Officers on staff duty generally serve but five years, after which they return to their regiments and are not again available for at least two years.

**United States.**—In the U. S. there is no general staff properly so called, but (as in Great Britain) some of the duties of this body are performed by officers of certain departments or by officers of the line temporarily detailed. The so-called staff departments are (1) the adjutant-general's, comprising 1 brigadier-general, 4 colonels, 6 lieutenant-colonels, and 6 majors, their principal duties being the ordinary routine of office-work, the wording and issue of the orders of commanding generals, and in the war department all matters relating to recruitment; (2) the inspector-general's (1 brigadier-general, 2 colonels, 2 lieutenant-colonels, and 2 majors), their duties consisting in inspecting the various posts, garrisons, military schools, and military departments of colleges to which officers are detailed, and the money accounts of disbursing officers; (3) the quartermaster's department (1 brigadier-general, 4 colonels, 8 lieutenant-colonels, 14 majors, and 30 captains), whose duties consist in constructing and repairing quarters and other public buildings, roads, etc., furnishing transportation and supplying fuel, forage, clothing, and material; (4) the subsistence department (1 briga-

dier-general, 4 colonels, 3 lieutenant-colonels, 8 majors, 13 captains), furnishing supplies of food (principally the ration), and certain other articles; (5) the judge advocate-general's department (1 brigadier-general, 1 colonel, 3 lieutenant-colonels, and 8 majors), who attend to questions of law and assist in revising charges and court-martial proceedings; (6) the medical department; (7) the pay department; (8) the Corps of Engineers, part of the line in European armies, but forming a closed corps in the U. S., recruited exclusively from the highest graduates of the military academy, mainly employed in time of peace on river and harbor work, a few in charge of repairs to forts or serving with the battalion of engineers, and one on the staff of the commander of each military department in the country; (9) the ordnance department (corresponding to the construction branch of European artilleries), employed in the various arsenals, work-shops, and gun-foundries, one on the staff of each department commander; (10) the signal corps; (11) the post chaplains. The chiefs of these departments, together with a certain number of officers of each, constitute a kind of staff to the Secretary of War and the general of the army. An intelligence bureau has been organized at the War Department. Each military department commander usually has one officer of each staff department on his staff: quartermasters, commissaries, and surgeons are also located in the large cities in charge of dépôts, etc. Each department commander has also his personal aides—a major-general 3, a brigadier-general 2.

Each regiment has also a regimental staff, comprising the adjutant and quartermaster of the regiment, detailed from the lieutenants for four years. Each post, moreover, has a post adjutant and a post quartermaster and commissary, detailed by the commanding officer from the lieutenants of the post.

For further information consult von Schellendorf, *Duties of the General Staff*; Rau, *L'état militaire des puissances étrangères* (1891); von Löbell, *Jahresberichte über die Veränderungen und Fortschritte im Militärdwesen*; and L. Beaugé, *Manuel de législation, d'administration et de comptabilité militaires* (1892).

Revised by JOHN P. WISSE.

**Staffeldt, ADOLF WILHELM SHACK, von**: poet; b. on the island of Rügen, Germany, 1769; studied in the military academy at Copenhagen, and entered the Danish army. In 1791 resigned, and studied law, archaeology, and the history of art at Göttingen, after which he spent several years in travel. In 1800 he returned to Denmark, and held important Government positions there until his death in 1826. His earliest collections of poems (1803 and 1806) attracted little attention at the time of their appearance, and on account of their depth of thought and frequent obscurity of language they have never won general popularity. Unlike Oehlenschläger, Staffeldt continued to be strongly influenced by German romanticism. Among his later works are the romances *Troubadouren*; *Trende Nætter* (Three Nights); *Roserne* (The Roses); and *Indvielsen* (The Consecration). See his *Collected Poems* (2 vols., Copenhagen, 1843). D. K. D.

**Stafford**: county town of Staffordshire, England; on the Sow; 29 miles N. N. W. of Birmingham, and 133 N. W. of London (see map of England, ref. 9-G). Among the churches are St. Mary's, restored by Sir G. Scott in 1845, and St. Chad, originally of Saxon origin, restored 1855-58. Shoemaking is carried on. Stafford returns one member to Parliament. Pop. (1891) 20,270.

**Stafford, WILLIAM HOWARD, Viscount**: statesman; b. in England, Nov. 20, 1612; was brought up a Roman Catholic; married a sister of Baron Stafford, to whose title Howard succeeded. During the civil war Stafford adhered to the royal cause, but after the Restoration often opposed in the House of Peers the measures of the court; was intimate with Shaftesbury, and was, on account of his religion, selected by the infamous Titus Oates as one of his victims. Accused of participation in the "Popish plot" by Oates in his first examination before the House of Commons, Stafford surrendered himself on the following day, and was committed to the Tower with four other accused noblemen Oct. 30, 1678. On Nov. 30, 1680, his trial for high treason was begun before the House of Lords, Sir Heneage Finch (afterward Earl of Nottingham) presiding as lord high steward. Stephen Dugdale and one Turberville, the chief witnesses, swore that Stafford had offered them rewards to participate in a conspiracy against the life of the king, and Beloe, Dangerfield, and Denis offered confirmatory testimony.

Stafford defended himself with spirit, but he was convicted Jan. 7, by 21 votes against 11, four of the Howard family being of the majority. Stafford was presented as Tumor Man, Dec. 23, 1886, protesting an indictment in terms which attracted great thought with the spectators. His widow was married, however, and his child, now Earl of Stafford, by Anne, Countess, Jan. 10, 1888, for the title became extinct on the death of the fourth earl in 1792. The attorney was executed by act of Parliament in 1694, and Sir George William Jennings was recognized as Baron Stafford in 1825.

Revised by P. M. COHEN.

**Staffordshire:** a west midland county of England, area, 1,617 sq. miles. The central part of the county is low and undulating, but to the north and the south the ground rises and the surface becomes steeper. The soil is generally cold, heavy, and not very productive. The coal-fields are very rich in the northern and southern portions of the county; iron, copper, and lead are found, together with marble, freestone, and an excellent potter's clay. With respect to its manufactures, chiefly cloth, millinery, and iron, the county is the third in rank in England. Seven manors are retained by the crown. Pop. (1891) 588,423.

**Stafford Springs:** borough; Telford, Conn., on the William & Anson, and the Central Vt. Railroad; 40 miles N. by W. of Williamstown, 30 miles N. of New London for location, 100 miles of Connecticut, ref. 7-1. It contains manufactures of wood and iron goods, Congregational, Methodist Episcopal, Protestant Episcopal, and Roman Catholic churches, high and graded schools, public library (founded in 1874), a national bank with capital of \$50,000, a savings-bank, and a weekly paper. Mineral springs said to be the attractions of the place as a summer resort for invalids and pleasure-seekers. Pop. (1891) 1,000; (1896) 2,121.

Revised by P. M. COHEN.

**Staff-Tree Family:** See SPINOSA-FRUIT FAMILIES.

**Stag, or Red Deer:** the largest deer of Europe, the *Cervus hyemalis*, a species much resembling the American wapiti. The male is called the *stag*, the female the *hind*, and the young the *calf*; the male under three years is called a *yearling*, under four, a *spoor*; under five, a *staggon*, and under six, a *stag*; so that strictly in sporting parlance, a stag is a red deer five years old. At six years he is a *hart*, and when seven years old he is a *hart crowned*, and is considered four years. The stag is distributed over the greater part of Europe, and is found in Northern Asia as far as the Lena and Lake Baikal. It inhabits Europe, in England, and the Highlands of Scotland. Its horns are long and branching. In summer it is yellowish-brown; in winter, reddish-brown; the color deepens much with age, but in winter the old stags are nearly black. The flesh is inferior to that of the fallow-deer. Revised by P. A. LUCAS.

**Star-bettle, or Horn-leg:** any one of several large beetles of the family *Lucanidae*, remarkable for the great size of the head and for the large horn-like mandibles. *Lucanus cervus* of the L. S. is a well-known inhabitant of decaying wood, piles of chips, etc., and is capable of inflicting a severe bite. *L. cervus* is European.

**Stage:** See THEATER.

**Stage-coach:** See CARRIAGE.

**Staggers:** a popular name for several diseases of horses and sheep. Blind staggers in horses is a sort of epilepsy; head staggers, an inflammation of the brain; grass staggers, an acute and dangerous gastritis. The treatment of the first is by action about the head, but the disease is incurable. The second usually receives treatment by means of blisters, leeches, and thorough bleeding. The last mentioned disease calls for antivenereal and good-sized doses of calomel and opium. Staggers in sheep is caused by larvae of *Onchocerca* in the muscles; they may sometimes be removed by drawing out the muscles and mixing with whisky.

**Staghound:** a large, rough-haired dog, much like the mastiff, but of greater build, although somewhat heavier. It is strong, swift, and fearless, and the rival of the bloodhound in power of scent. It is supposed to be a cross breed of the bloodhound and the greyhound, and is used in Europe for hunting the deer, and, to some extent, in the western parts of the U. S. for hunting antelope. P. A. L.

**Stagfing** [see Stag; see Sweden]: town of Cheshire, in Lancashire. It was a colony from Arcton, but fell into the hands of the Pictish monarchs. It was the birthplace of Aristotle, and in honor of his great tutor Alexander received the title, but its prosperity was merely temporary.

**Stagfing, Aristotle the:** See ARISTOTLE.

**Stagnellius, Erik Jönas:** poet; b. in Gledåsa, Sweden, Oct. 14, 1747. Although at first strongly influenced by Plagiarism from Sweden, Lagerstedt and in 1770 finally freeing himself from its influence, Stagnellius developed a style and voice of his own in 1780. All his earlier and thoughtful, in one of his most of the different aspects of greatness, and in those speculations he goes to the furthest extreme. In some of his aspects he has not simply been surpassed by Shelley. Another his works are *Walden* (1817), *Leifur's Saga* (1818), *Stagnellius* (1824), his most characteristic collection of poems, *Minne* (1824), *The Mariner*, 1824, his last (1824), and *Stagnellius* (The Mariner, 1824). D. Apr. 14, 1825. His collected works were published in 1825-26 (11 vols., Stockholm).

Revised by P. M. COHEN.

**Stahl, Friedrich Johann:** jurist; b. in Munich, Jan. 18, 1758, of Jewish parents; embraced Christianity in 1782, studied law at Würzburg, Heidelberg, and Göttingen; was appointed Professor of Jurisprudence in 1802 at Bonn, and in 1810 at Berlin. His specialty was the philosophy of law, and in this system he was a disciple of Schelling. Assuming that human reason is incapable of arriving at a positive conception of truth by itself, he deduced the ideas of state, government, etc., from the doctrines of Christian revelation, and bases the authority of officials and the changes of offices on a divine ordinance. As a member of the opposition to the Prussian king he became the leader of the liberal and aristocratic party during the period of reaction which followed the abortive revolution of 1848 in Berlin. D. at Brückmann, Bavaria, Aug. 10, 1881. His principal works are *Philosophie der Rechts* (1810), *Die Philosophie des Rechts* (1847), *Was ist Revolution?* (1848).

**Stahl, Georg Kaspar:** chemist and physician; b. at Ansbach, Bavaria, Oct. 31, 1760; studied medicine at Jena; was appointed physician to the Duke of Weimar in 1787, Professor of Medicine at the University of Halle in 1804, and physician to the King of Prussia in 1810. D. in Berlin, Mar. 14, 1834. He invented a theory of phlogiston which was generally adopted, and is considered valid up to the time of its rejection. (See CHEMISTRY.) His principal works are *Experimenta Chemica* (1781) and *Theoria Medica* (1787).

**Stahr, Adolf Wilhelm:** jurist; b. at Preussisch, Brandenburg, Prussia, Oct. 22, 1806; served classical languages and literature at Halle; was appointed professor at the gymnasium of Oldenburg in 1836, moved in 1852 to Berlin, where he married the actress Emma Luciani in 1855. He was a very prolific writer, innumerable books and articles for periodicals treat subjects of antiquity and modern times, history and art, critically and in a descriptive manner. Some of his works have been translated into English, as, for instance, *Thesen über Kunst, Aesthetik und Wissenschaft der Kunst* (2 vols., 1854-55), *The German* (New York, 1858-59); and his somewhat superficial but clearly written biography of Lessing, *Dr. K. Lessing, sein Leben und seine Werke* (2 vols., 1859), by Prof. E. F. Bohn, of Michigan University (Boston, 1860). He wrote the text to Knauth's *Goethe's Werke* (part I, Goethe's *Meinungsleben*). His *Goethe's Werke* (2 vols., 1854) drew great attention to the stage of Oldenburg. D. at Wiesbaden, Oct. 2, 1870.

Revised by JAMES GORDON.

**Stalge, Richard Humbert:** painter; b. in Leeds, England, Sept. 17, 1817; removed to the U. S. in 1841; became a musician at Newport, R. I., where he took lessons in painting from Washington Allston and James Smiley; became eminent as a portrait-painter, a painter of art which he subsequently relinquished for genre-pictures and compositions. Among his best productions are *The Crustacean*, *See, Cat's Cradle*, *Katzen*, *The Love-letter*, *The Seal*, *See's Dream*, and *News from the War*. D. at Newport, R. I., Oct. 11, 1881.

**Stained Glass:** See GLASS.

**Stainer, Sir John:** composer and organist; b. in London, June 6, 1840; studied initially in England; entered the choir of St. Paul's Cathedral when seven years of age, remaining until his voice broke in 1856, playing the organ on occasion. He occupied several positions as organist till 1872, when, on the resignation of Sir John Goss, he was appointed organist of St. Paul's, and remained until 1883, when he was obliged to resign on account of failing eyesight. In that year he was knighted, and on the death of

Sir F. A. Gore Ouseley in 1889 was appointed to succeed him as Professor of Music in Oxford University. His degrees and honors are as follows: Mus. Bac. Oxon. 1859; B. A. 1863; Mus. Doc. Oxon. 1865; M. A. 1866; Hon. Mus. Doc., Durham, 1885; Chevalier of the Legion of Honor 1878. He is also honorary member of the Royal Academy of Music and honorary fellow of the Tonic Sol-Fa College. His compositions are chiefly sacred and include three sacred cantatas, *The Daughter of Jairus*, Worcester festival, 1878; *St. Mary Magdalene*, Gloucester festival, 1883; *The Crucifixion*, 1887; the oratorio *Gideon*, an early work; and many church anthems and services. He has also written several theoretical works, a treatise on the *Music of the Bible*, and a *Dictionary of Musical Terms*. D. E. HERVEY.

**Stair, JAMES DALRYMPLE**, Seventh Baron and First Viscount: jurist; b. at Drummurichie, Ayrshire, Scotland, in May, 1619; graduated M. A. at the University of Glasgow 1637; obtained a commission as captain in the Scottish army, but at the age of twenty-two accepted the professorship of philosophy at Glasgow, which he held till 1647; was admitted an advocate at the Scottish bar Feb., 1648; was secretary to the commissioners sent to treat with Charles II. at Breda 1649-50; became a lord of session July 1, 1657; was knighted by Charles II. 1660, and confirmed as lord of session Feb. 13, 1661; resigned office 1663 from unwillingness to subscribe the declaration against the Covenants of 1638 and 1643 appended to the oath of allegiance, but his resignation was declined, and he was made a baronet June, 1664; became lord president of the court of session Jan., 1671; refused to take the new test oath, and was removed from his offices 1681; published in that year his *Modus Litigandi* and *The Institutions of the Law of Scotland*—a work which has been called the Scottish Blackstone; becoming involved in a dispute with Claverhouse he was forced to flee to Holland Oct., 1684; prepared there his *Decisions of the Lord of Council and Sessions 1661-81* (Edinburgh, 2 vols. folio, 1683-87); published at Leyden his Latin treatise *Physiologia Nova Experimentalis* (1686); received a pardon 1686; accompanied the Prince of Orange to England 1688; was reinstated in the presidency of the court of session, and made Viscount Stair Apr. 21, 1690; published an *Apology* for his political course (1690) and a *Vindication of the Divine Perfections* (1695). D. in Edinburgh, Nov. 29, 1695.

**Stair, JOHN DALRYMPLE**, First Earl of, better known as the Master of Stair, son of Viscount Stair: b. in Scotland about 1648; was admitted as advocate in the court of session Feb., 1672; was one of the council for the Earl of Argyll on his trial for treason 1681; was twice imprisoned between 1681 and 1685; was received into favor on the accession of James II., by whom he was made lord advocate 1685 and lord of session and lord justice clerk 1686; supported the Revolution 1688; was a leading Scottish member of the Convention Parliament Mar., 1689; was one of the three commissioners sent to London to offer the crown of Scotland to William and Mary May, 1689; was reappointed lord advocate 1690; became one of the Secretaries of State for Scotland 1691; plotted the massacre of GLENCOE (q. v.), Jan., 1692, for which act he was dismissed from office 1695 and censured by a parliamentary committee of inquiry, but was never subjected to prosecution; succeeded his father as Viscount Stair in 1695; was sworn of the privy council on the accession of Anne 1702; was created Earl of Stair Apr. 8, 1703; was one of the commissioners who negotiated the treaty of union between Scotland and England 1706, and was mainly instrumental in passing that measure through the Scottish Parliament. D. Jan. 8, 1707. See *Graham, Stair Annals* (1875).

**Stair, JOHN DALRYMPLE**, Second Earl of: soldier; b. in Edinburgh, July 20, 1673; had the misfortune in boyhood to kill his elder brother by the accidental discharge of a pistol; educated at the University of Leyden, where he was distinguished for scholarship; entered the army as a volunteer under the Earl of Angus, and commanded the Cameronian Regiment at the battle of Steinkirk 1692; was aide-de-camp to the Duke of Marlborough at Venloo and Liège 1702; succeeded to the earldom 1707; obtained command of the Scots Greys; was commissioned general; distinguished himself at Ramillies and Oudenarde 1706, and at Malplaquet 1709; withdrew from the army in 1711; became privy counselor and representative peer for Scotland 1714; was appointed commander-in-chief of the forces in Scotland on the accession of George I. (1715); was ambassa-

dor to France 1715-20; resided on his estate at New Liston, Scotland, and devoted himself to scientific agriculture 1720-40; was made field-marshal commander-in-chief of British forces in Flanders and ambassador extraordinary to the States-General of Holland 1741; won the battle of Dettingen June 27, 1743, and subsequently filled several important public posts under the Walpole administration. D. in Edinburgh, May 9, 1747. The *Memoirs of the House of Dalrymple*, published from family papers (1876), contains important historical data.

**Stalactites** [from Gr. *σταλακτός*, dropping, oozing out in drops, deriv. of *σταλάω*, to drop]: icicle-like masses of lime, limonite, chalcidony, pyrites, etc., attached to the roofs of caverns; they are formed by the evaporation of water holding these substances in solution. Stalactites sometimes form columns reaching from floor to roof of high chambers; sometimes they imitate curtains, waterfalls, etc., and constitute notable features in some of the most famous caves. The name *stalagmite* (Gr. *στάλαγμα*, a drop) is given to accumulations of material of the same nature as stalactites, but deposited on the floors of caverns. This sometimes forms continuous sheets over the surface, sometimes rises into columns, which meet and blend with the stalactites above. Stalactites are often tubular, and, indeed, generally begin to form as tubes, since the solid matter held in solution by a drop of water when precipitated by evaporation forms a ring at the base and outside of the drop.

Revised by ISRAEL C. RUSSELL.

**Staley, Cady, Ph. D., LL. D.**: civil engineer and educator; b. at Scotch Bush, Montgomery co., N. Y., Dec. 12, 1840; educated at Union College. He has been in engineering work on the Central Pacific Railroad, Professor of Civil Engineering in Union College 1867-86, and dean of the faculty, and since 1884 president of the Case School of Applied Science in Cleveland, O. He is the editor of recent editions of Gillespie's *Surveys and Roads and Railroads*, and (with G. S. Pierson) author of *The Separate System of Sewerage* (1886).

**Stalker, JAMES, D. D.**: minister; b. at Crieff, Perthshire, Scotland, Feb. 21, 1848; was educated at the University and New College of Edinburgh, Universities of Berlin and Halle; minister of St. Brycedale Free church, Kirkcaldy, 1874-87; since 1887 of St. Matthew's, Glasgow. He was Cunningham fellow at New College 1874, and Lyman Beecher lecturer at Yale Theological Seminary 1891. Dr. Stalker has published *The Life of Jesus Christ* (Edinburgh and New York, 1879; many later editions; translated into several foreign languages); *The New Song: Sermons for Children* (1883); *Life of St. Paul* (1884; several later editions); *Imago Christi* (1889; 7th edition, 1894; translated into Norwegian, German, Japanese, and other languages); *The Preacher and his Models*, Lyman Beecher lectures (New York, 1891; 2d ed. 1892); *Men and Morals* (1892); *The Four Men and Other Chapters* (1892); *The Trial and Death of Jesus Christ* (1894). C. K. HORT.

**Stalwarts**: a name applied to the section of the Republican party that in 1881 opposed the administration of President Garfield. The quarrel arose from the latter's appointment of a collector of the port of New York in opposition to the wishes of Conkling and Platt, the Senators from that State. The party was divided between the Stalwarts and "Half-breeds," as the friends of the administration were called, and this dissension helped the Democrats to win in the election of 1884. See **REPUBLICAN PARTY**.

**Stamboul, stam-bool'**: the wealthiest, most populous, and important of the territorial divisions forming the city of CONSTANTINOPLE (q. v.), called Istamboul by the Ottomans. Stamboul is a triangular-shaped promontory, projecting eastward toward the Bosphorus from the mainland, and included between the Golden Horn and Marmora. It comprises thirteen of the fourteen *regions* or *climata* of the Nova Roma of Constantine. E. A. G.

**Stamen** [= Lat., liter., warp in an upright loom, thread, fiber, deriv. of *stare*, stand; cf. Gr. *στήμων*, warp (in an upright loom), deriv. of *στήνω*, stand]: the pollen-bearing organ in plants. Morphologically it is a leaf, upon which one or more pollen-sacs (spore-sacs or sporangia) are produced. On account of its special function it is rarely an expanded structure, although it is so in water-lilies, cannas, and some other cases (Fig. 1, a). In its usual form (Fig. 1, b) the slender stalk (*filament*) is surmounted by the pollen-sac (*anther*), which at maturity contains many loose cells, the

FIGURE 10. In *Yucca* lateral pollen-sacs are attached to the under side of the pistate stamen, while in *Arceuthobium*

FIG. 10.—Stamens: a, water lily; b, anemone; c, *Yucca*; d, *Staphis*; e, *Pinus*; f, *Abies*; g, *Tridacena*; h, *Thymus*; i, *Chrysanthemum*; j, *Aspidistra*; k, *Chenopodium*.

the two sacs are attached by the tips only. In *Pinus* (a) and the pines the sacs are attached at the back of the leaf-like stamen. Other forms are shown in 7 to k, the most curious being found in *Aspidistra* (j), where the sacs are long and spirally twisted.

When young, the pollen-sacs are composed of uniform tissue, but soon certain cells in vertical rows become differentiated (Fig. 2, b, c), and eventually by subdivision produce the pollen-sacs. At maturity there may therefore be one, two, or four cavities (Fig. 2, a) containing pollen, and this is not true for the longitudinal rupture of the anther (Fig. 1, d + e), or by the opening of a terminal or lateral pore (Fig. 1, c).

When associated with the pistil in the same flower the stamens are usually below it (disperous), but by the adhesion of the floral parts they may be above it (epiperous). Normally they are separate from one another, but in some cases they are more or less united by their filaments, as in peas and beans, or even by their anthers, as in the *Campanula*. See FLORULA.

CHARLES E. HENRY.

**Stanford**: town and city; Fairfield Co., Conn.; on Long Island Sound, Mill river, and the N. Y., N. H., and Hart. Railroad, 34 miles N. E. of New York, 78 miles S. W. of Hartford (for location see map of Connecticut, ref. 12 D). The main part of the town lies in a valley, with hills on three sides and the Sound on the S. The harbor has been improved by the U. S. Government and is suitable for vessels of large draught. There is a daily steamer line to New York. At Shaugen Point, on the shore, are the cottages, hotels, and other public resorts, and the Stanford Coast Line Hotel. The city comprises four-fifths of the population of the town, and has an excellent water supply from Trout Lake, sewerage system, paid police and fire departments, well organized public school system with high school, facilities created in 1886, several private boarding and day schools and summer, a hospital and home, units owned by St. John's church (Protestant Episcopal), the Presbyterian, Roman Catholic, a State, and a savings bank, electric light and railroad plants, and a daily and a weekly

newspaper. The town and city have a combined bonded debt of \$600,000. There are extensive lumber mills, a mechanical & pattern, and manufacturing of local building materials, including appliances, pipe-fitting, upholstery, paint stores, shoes, jewelry, medicines, stoves, saws, lumber, and other articles. Stanford was settled in 1641; had its name changed from the Indian Wap-pa-gan, in 1612; and was incorporated as a borough in 1840 and as a city in 1906. The assessed valuation of city property in 1915 was \$17,000,000. Pop. (1900) 11,800; (1910) 15,000; (1915) estimated, 16,000. (United States Census.)

**Stammering** (from G. *stammere*, to hiss, to mutter; cf. O. H. Germ. *stammeln*): *Germ. stammeln*, to mutter, appears in Geth. *stammere*, stammering, in Geth. *stammere*, to mutter, to stammer, and in *stammere*, to mutter, to stammer, is an affection of the faculty of speech characterized by irregular, imperfect, or spasmodic action of the intrinsic muscles of articulation. It is a really a *stammer*, often hereditary, condition of the muscles concerned, a defective power of articulation. It may be constituted under two somewhat different forms. In the one there is a difficulty in beginning the enunciation of words and this is done essentially in regard to those words which begin with what are called the "explosive consonants" (b, p, and t) which require the sudden opening of the lips. In the other form the word is begun but after the enunciation of a syllable there is a spasmodic, and for a time uncontrollable, cessation of the same syllable. To this variety the term *stuttering* is sometimes applied. Stammering is one of the minor diseases, and may be acquired by *stammering* in speech, or by conversation with others similarly affected, or even by looking such persons. In the majority of cases it disappears after the attainment of adult age, probably in consequence of the constant efforts of the subject to improve his habit of speaking. It is generally accompanied by emotional disturbances, especially fright and apprehension, and is much improved, and often cured by the patient acquiring confidence in himself, never attempting to speak in a story or when the chest is empty of air, or by reading measured sentences slowly and with deliberation. Stammerers never have any difficulty in singing, for they know that a certain definite position is to be observed, and this gives them the confidence they require. The affection is sometimes permanently removed in time by the patient performing some trifling interesting action simultaneously with the enunciation of the words, such as humming. This is sometimes prevented the fault by moving a finger at the very instant that he begins to utter the word. Revised by W. PERRY.

**Stamp Acts**: laws requiring that stamps purchased from the government be placed on certain legal documents. In the history of the British colonies in North America the term Stamp Act refers to a law passed by the British Parliament Mar. 22, 1765, "for granting and applying certain stamp duties and other duties in the British colonies and plantations in America." It took effect from Nov. 1, 1765, and was the nucleus of such subsequent protests and violent resistance in most of the colonies that it was repealed Mar. 18, 1766, and a bill of indemnity for those who had incurred penalties was passed June 8 of the same year.

**Stamp-mill**: See GRINDING AND CRUSHING MACHINERY.

**Stamps**: official marks put upon things disposable with some duty or tax, showing that the tax has been paid. These stamps may be either embossed, or printed separately and pasted on things by being gummed on the back. The British Government has long required the use of such stamps on checks, receipts, bank drafts, and legal documents of all kinds, and during the civil war in the U. S. (1861-65) a similar use of stamps was made for revenue purposes. Stamp duties were also levied during the same period on proprietary articles, inferior controls, and a great variety of other commodities. Internal revenue stamps are used in the U. S. only for such articles as tobacco, snuff, cigars, etc., etc., and since 1894 for playing cards.

**Postage stamps** are also of two kinds: (1) those that are impressed on envelopes, newspaper wrappings, and post cards, and fly adhesively behind. Their use is an evidence of prepayment of postage. Before their introduction it was the custom to take letters to the nearest postoffice and prepay the postage tax in cash, the postmaster then stamping each mail matter as prepaid. The introduction of the postage stamp did away with this cumbersome method for enabling the corresponding public to prepay the postage, the evidence of prepayment, and facilitated mail delivery.

spondence, but also the work of the postal authorities by obviating the necessity for a separate handling of each piece of mail matter.

The first introduction of postage-stamps for regular issue took place in Great Britain on May 6, 1840, and was the result of the earnest efforts of Sir Rowland Hill, who had fought for three years in the House of Commons for postal reform. Prior to that time, James Chalmers, of Dundee, Scotland, had invented an adhesive label intended to be used as a postage-stamp, but he was unable to introduce his invention, and the real credit must remain with Sir Rowland Hill, who carried through successfully his scheme for the reduction of postage, and at the same time the introduction of evidences of prepayment. It is true that Sir Rowland Hill did not attach so much importance to the adhesive label as to prepaid envelopes, and his fame rests on the Mulready envelopes (engraved by W. A. Mulready), representing Britannia sending letters to all parts of the world; these were first placed on sale on May 6, 1840. The envelopes were received with ridicule throughout the United Kingdom, and were soon dropped out of use, the adhesive label taking their place.

It was in France that the first attempt was made to prepay letters by means of a cover, envelope, or band at a fixed rate. De Velayer, master of petitions, was the inventor; the idea of cheap postage might also be ascribed to him, although it was only for the Paris local post. A postal system already existed in France and other countries, but no city had a delivery system. De Velayer obtained in 1853 a special privilege from King Louis XIV. to establish a little post-office in Paris, and placed numerous boxes all over the city, which were to be emptied each day. He announced that in order to expedite the service his clerks would not receive any money, but that the letters must be accompanied by a ticket showing prepayment, which ticket must be attached to, wrapped around, or placed within the letter in such a manner that the clerk could easily remove it; when an answer was required the sender had to attach or inclose a second ticket. These tickets cost one sou (about a cent) each, and the principal office for their sale was at the palace. The postal system had some success as a curiosity, but it was in advance of its time, and, besides suffering from the indifference of the public, it was soon attacked by evil-wishers; the boxes were soiled, malicious people going so far as to put rats, mice, and even worse things into them, and the enterprise was soon abandoned.

Some collectors of postage-stamps accept certain letter-sheets stamped in the kingdom of Sardinia in 1818 and 1819. These stamps, however, represent the exact contrary of a postage-stamp, as they indicate the amount of tax paid by the writer for the privilege of sending his letter by other means than the regular postal service; this is a revenue tax, and not in any sense a postal tax.

The example of Great Britain was first imitated in the U. S., where the proprietors of local delivery companies began to sell postage-stamps to their patrons as early as the year 1842. The first one was the City Dispatch Post, owned by Alexander M. Greig, operating in the city of New York; in Aug., 1842, he sold the entire outfit to the U. S. Government, which retained his design for the postage-stamp, a three-quarter face portrait of Washington, changing the inscription to read "United States City Despatch Post." The Government of the U. S. was rather tardy in accepting the new system, and until 1847, when the first stamp for general use was issued, the postal service depended either upon the old cumbersome system or the individual enterprise of the postmasters in various towns, who, on their individual responsibility, had postage-stamps printed and sold to the patrons of their respective offices. This occurred in the following cities: Baltimore, Md. (1845); Brattleboro, Vt. (1846); Millbury, Mass. (1847); New Haven, Conn. (1845); New York, N. Y. (1845); Providence, R. I. (1846); St. Louis, Mo. (1845). It is of interest to note that before the introduction of postage-stamps in the U. S. the post-office authorities in large cities kept regular running accounts with all well-known merchants. Business houses sent their mail matter to the post-office daily, and the cost of postage was calculated by the clerks and charged up to the merchants, bills being rendered at the end of each month.

Among established governments, Brazil was the first to follow the example of Great Britain with an issue of stamps for general postal use. These appeared on July 1, 1843, and were of three values, 30, 60, and 90 reis; each

bore simply the numeral of value on an engine-turned groundwork. Postage-stamps were first issued by France on Jan. 1, 1849, in a set of two, bearing an allegorical head of Liberty; and by Belgium in Nov., 1849, in a set of two, with the portrait of King Leopold. Bavaria, which issued stamps in Nov., 1849, was the first of the many states and principalities which now constitute the German empire to adopt the new system; Prussia and Hanover followed in 1850, and Baden, Württemberg, and Saxony in 1851. The Princes of Thurn and Taxis, who for centuries had enjoyed the monopoly of the postal service in certain of the German states, issued their first stamps in 1852. These continued in use till 1868, or until the formation of the North German Confederation, which included all the states that employed the service of the Princes of Thurn and Taxis, with the addition of Prussia and Saxony. On the formation of the German empire in 1871 all the separate postal administrations, except those of Bavaria and Württemberg, were superseded by the service of the central Government.

The federal administration in Switzerland did not issue postage-stamps until 1850, but of the separate cantons Geneva and Zurich had issued them in 1843 and Basel in 1845. Most of the other prominent governments in Europe followed in rapid succession, but some were very slow in accepting the reform, as appears from the following list: Spain (1850), Italy (1851), Denmark (1851), Portugal (1853), Norway (1854), Russia (1857), Sweden (1858), Greece (1861), Turkey (1863).

In North America, Canada, New Brunswick, and Nova Scotia made their first issues in 1851, Mexico in 1856, and Newfoundland in 1857. In South America Brazil was followed by British Guiana in 1850, Chili in 1852, and Uruguay in 1856, while Ecuador waited until 1865, Bolivia until 1867, and Paraguay until 1870.

Every colony in Australia adopted the reform early in the fifties, while Mauritius, the Cape of Good Hope, and Natal were the first in Africa, Egypt being next in order in 1866, with a set of seven stamps bearing a representation of a pyramid. India in 1854 was the first government to issue postage-stamps in Asia, using the familiar portrait of Queen Victoria.

The processes employed for the manufacture of postage-stamps are extremely varied in character, every style of engraving and printing having been used in various parts of the world. Among them the most used are engraving on steel, on copper, on zinc, and on wood, surface-printing from steel, copper, and wood, and lithography. All early issues of postage-stamps were imperforate or with plain edges, until in 1848 Henry Archer, in London, invented a machine for perforating. The first experiments were in the nature of trials, and the device was not officially used until 1854, when Mr. Archer sold his device to the British Government.

The number of stamps issued by different countries, as well as the extremes, both high and low, of denomination, vary greatly. The U. S. enjoys the distinction of having had in regular use at one time a larger number than any other country. From 1873 to 1884, besides the regular issue for general use, which consisted of 13 adhesive stamps, 13 envelopes, and 2 wrappers, each department of the Government had its own series, with a total of 92 adhesives, 12 envelopes, and 2 wrappers; besides these there were 7 postage-due and 24 newspaper and periodical stamps. This enumeration does not take into account minor varieties of die or the different colors of paper used for the envelopes. The postage-stamps which have the lowest face value are the  $\frac{1}{2}$  millesimo stamp of Cuba and Porto Rico and the  $\frac{1}{2}$  centimo of Spain, each representing about  $\frac{1}{100}$ th of a cent. These are used for local newspaper postage. The stamp of largest denomination is the £20 of South Australia, which is available for both postage and revenue purposes.

*Overprinted Stamps, etc.*—One of the most interesting developments of the use of postage-stamps is the means employed by postmasters in various parts of the world for providing a particular value the stock of which may have become exhausted. The usual method is to surcharge or overprint stamps of some other value with the new value intended to be given to the stamp, and the first instance of such practice appears in France in 1850, when, to supply the demand for a 25-centime stamp, to meet a newly established rate of postage, a quantity of 20-centime stamps, which had been printed by error in blue, were overprinted with the figures "25." These were not, however, placed in circulation, as a new supply of the desired value was prepared in time.

# REPRESENTATIVE TYPES OF POSTAGE-STAMPS.

As ground of such overprinted or surcharged stamps are made principally to temporarily meet, in the future, a falling away even more than the ordinary course, and the increase in the amount of collection in recent years has opened up a profitable field for speculation. Collectors and dealers in various parts of the world have succeeded in inducing post-offices and other officials to surcharge small quantities of stamps, supplying a few to the public for its correspondence and hoarding, over the remainder to the speculator. In many cases, the post-offices have participated in the profits. Another means of procuring a temporary or provisional issue is to add to the full, or smaller, sections stamps of a higher denomination, using the fraction to indicate such portion of the value of the original stamp as the fraction will represent. The most prolific producers of surcharged stamps have been the British and French colonial post-offices, but the Colonial Office in London has taken some steps (first alone, by requiring responsible officials to maintain a sufficient supply of every value, imposing a fine in case this requirement should be neglected).

**Memorial stamps.**—Another interesting feature of the use of postage-stamps, and a direct result of the wide and varied interest which they have in all parts of the world, is the issue of a special kind of stamp on the occasion of any celebration or jubilee. The first issued of this description was made in Great Britain in 1887, on the fiftieth anniversary of the accession of Queen Victoria to the throne. The example was not followed for some years, but it has become increasingly common since, and among them may be mentioned especially the Calcutta issue made by the U. S. in 1936 to celebrate the discovery of America, and similar issues made by the Argentine Republic, Nicaragua, Salvador, Honduras, Venezuela, and Porto Rico in 1902 and 1904. All of these were legal tender issues, made to commemorate an event of local importance, but they have opened the eyes of other post-offices to the speculative value of such stamps, and have seen a flood of jubilee and commemorative issues. Numerous examples of such stamps are at hand in the republic of San Marino, to commemorate the opening of a new palace, and an issue in Portugal to commemorate the 700th anniversary of the birth of St. Anthony of Padua, both of which are lawfully made solely on account of the profits to be derived from the sale to postage-stamp collectors.

**Stamp-collecting.**—The collecting of postage-stamps for amusement is said to have begun about the year 1850, or as soon as it was noticed that stamps of different colors, the signs, and values were being received in mails from various portions of the world. The value and rarity of any particular specimen was not taken into account at all, and was frequently lost in exchanges made among collectors in years gone by of specimens, some of which are now worth hundreds of dollars, for others which still have no appreciable value. As the practice of collecting became more general, the most of postage-stamps became more and more minute, and the collector of early times can hardly realize the extent to which the study of postage-stamps has been carried. Considerable variation of paper, style of printing, perforation, gum, water-mark, etc., is considered as marking a different issue, and in some instances as many as fifty distinct variations of a single stamp are collected when in former years a single specimen would have been considered fully representative of the type.

Full recognition is also accorded to certain classes of adhesive labels which can, but in any sense, be justly termed postage-stamps, but in some instances represent the exact contrary. Prominent among these are the postage-like stamps issued by many countries for the cancellation of the postal administration, and which indicate that the postage has not been prepaid, and the newspaper and periodical stamps issued by the U. S., which are never sold to the public, but are used only as vouchers in the books of the Post-office Department.

The literature of philately (as the study of postage-stamps is called), embraces a very section of the globe, and monthly and weekly journals are published even in India, China, Australia, and Africa. The chief books of reference are 1. *Catalogue of the Advanced Collection of Postage-stamps*, by the Great Stamp and Coin Company (New York); *Catalogue des Timbres Postaux*, by J. H. Moore (Brussels); and the publication of the London Philatelic Society. The leading philatelic journals are *The American Journal of Philately*, Great Stamp and Coin Company, New York; *The London Philatelist* (The London Philatelic Society); *The Monthly Journal* (Stanley Gibbons, London); *The Tim-*

*ber-Post* (J. H. Moore, Brussels); *Der Philatelist* (Dresden); and *Wochenblatt des Vereinstischen Journal* (Aachen, Sax., Germany).

**Stanbury** (city), Gentry co., Mo., on the Omaha and St. L. Railway, 30 miles N. by E. of St. Joseph, 100 miles S. E. of Omaha, Neb. (see location, on map of Missouri, vol. 1, 147). It is in an agricultural region, and occupies a State route with capital of \$250,000, a private bank, and a saw-mill, a 4-to-weekly, a monthly, and 2 weekly periodicals. Pop. (1900) 1,707; (1905) 2,100.

**Stanbury**, Henry; jurist; b. in New York, Feb. 29, 1806; graduate of Washington College, Pennsylvania, in 1829; admitted to the bar in 1831, removed to Ohio and became attorney general of the State in 1836; appointed Attorney-General of the U. S. in 1860 under the administration of President Johnson, for whom he acted as leading counsel in the impeachment trial of 1868; returned to the practice of the profession at Cincinnati. D. in New York, June 25, 1881.

**Stanbridge**, John; teacher and author; b. at Hartford, Northampton co., England, about 1480; became perpetual fellow of New College, Oxford, 1487; headmaster of the free school connected with Magdalen College about 1489, and afterwards for many years its head master. D. about 1545. He was the first author of school books that were extensively printed and used in England, and his works have become bibliographical curiosities. Among them were *The Arithmetick of Master Stanbridge's name*, *Magdalen's school* before 1500; *Booke of Arithmeticke* and *Verbal Arithmetic* of which at least eight editions were printed in Wyndon de Worde; and *Verbal Arithmetic* (1510).

**Stancho**: See *CHAS.*

**Standards**: See *BANDS* and *FLAGS*.

**Standards of Value**: See *MONEY* and *STANDARD*.

**Standard Time**: See *TIME*.

**Standish**, Miles; soldier; b. in Lancashire, England, about 1584; claimed to be descended from the knightly family of Standish of Druxbury Hall, Lancashire, served on the Continent, probably with the English forces; became a captain, settled in London, and, though not a member of the English Church or congregation, accompanied the Pilgrims of the Mayflower to New England 1620, lost his wife, Rose, during the first winter, is said by tradition to have employed his friend John Alden to translate his marriage with the fair Priscilla Mullins (see *Longfellow's Churchyard of Miles Standish*), with the well-known result that Alden joined the mission; rendered important services to the colonists in preserving them from the open and secret hostilities of the Indians, buying with his own hand killed at Weymouth (1620) (see *Mass.*), an Indian chief who had planned a massacre; visited England as agent for the colony 1625, returning with supplies 1626; took up the settlement at Merry Mount (see *Mass.*), returned 1628, was one of the original proprietors and settlers of Druxbury, having given that name to the town in memory of the seat of his English ancestors; was for the remainder of his life either magistrate or a member of the board of assistants in the governor, and took part in the settlement of Bridgewater 1634. He at Druxbury, that 3 a. m. 15 s. s. 1638. He was of small stature and choleric temper, and possessed great energy and force of will. One of his swords and other relics are preserved in the Pilgrim Hall, Plymouth. A monument to his memory stands on the commanding eminence in South Druxbury, formerly called Captain's Hill, from having been the place of his residence. Many incidents of his career are given with a partial genealogy of his descendants in Justin Winsor's *History of Druxbury* (1846). Also see De Costa, *Footprints of Miles Standish* (Churchtown, Mass., 1904).

**Stand pipe**, a vertical cylindrical tower connected with a water-supply system to provide pressure and sometimes to serve partly as a water-gate. Standpipes are made of wrought-iron or steel plates riveted together, and usually vary in diameter from 12 to 20 feet, although a few have been built as far as 40 feet. The height depends upon the pressure required, and is usually from 60 to 150 feet, although some are nearly 250 feet high. Sometimes the upper part of the tower consists of a tank supported by a frame, the water being carried to it by a pipe of much smaller diameter. A stand pipe is used only in connection with a pumping system, and is most effective when placed near the pump.

The water is forced up against the head in the stand-pipe, and this in turn maintains the pressure throughout the pipe system. Stand-pipes are sometimes destroyed by wind or by accidents due to other causes. For an account of these, see a series of articles by Pence in *Engineering News* during 1884.

MANSFIELD MERRIMAN.

**Stanfield, WILLIAM CLARKSON:** landscape and marine painter; b. at Sunderland, Durham, England, in 1793; d. at Hampstead, May 18, 1867. He was a sailor in the British navy, became a scene-painter while still a young man, and taking up painting of landscape and naval battle scenes attained success and was elected a Royal Academician in 1835. Among his most celebrated works are *Battle of Trafalgar* (1836) and *Battle of Roveredo* (1851). W. A. C.

**Stanford:** town; capital of Lincoln co., Ky.; on the Lexington and East. Railway; 38 miles S. by W. of Lexington, 104 miles S. E. of Louisville (for location, see map of Kentucky, ref. 4-H). It is in an agricultural region, and contains woolen, flour, and grist mills, the Stanford Female College, a national bank with capital of \$200,000, a banking and trust company with capital of \$200,000, and a semi-weekly newspaper. Pop. (1880) 1,213; (1890) 1,385.

**Stanford, CHARLES VILLIERS:** composer; b. in Dublin, Ireland, Sept. 30, 1852; went to Leipzig to study in 1874, and then to Berlin, returning home in 1876. His compositions include several symphonies, much sacred music in large forms, the two oratorios *The Three Holy Children*, for the Birmingham festival of 1885, and *Eden*, for the Birmingham festival of 1891; three operas—*The Veiled Prophet*, produced at Hanover, Feb. 6, 1881, *Savonarola*, Hamburg, Apr. 18, 1884, and *The Canterbury Pilgrims*, for the Carl Rosa Company, Apr. 28, 1884; the cantata *Elegiac Ode*, 1884, being a setting of Walt Whitman's *Burial Hymn*; music to the Greek plays *Eumenides* and *Edipus Tyrannus*; and Psalm cl. in cantata form (1887). He received the degree of Mus. Doc. from Cambridge in 1883, succeeded Otto Goldschmidt as conductor of the Bach Choir in 1885, and was appointed Professor of Music in Cambridge University Dec., 1887, on the death of Sir George Macfarren. D. E. HERVEY.

**Stanford, LELAND:** capitalist and philanthropist; b. at Watervliet, N. Y., Mar. 9, 1824; received a common-school education; studied law, and was admitted to the bar in 1849; soon afterward removed to Port Washington, Wis., where he practiced law till 1852, when he went to California and engaged in gold-mining; settled in San Francisco in 1856, and entered into business with three of his brothers. He first appeared in politics as a delegate to the convention at Chicago in 1860 which nominated Abraham Lincoln for the presidency; was elected Governor of California in 1861, and in his inaugural address urged the importance of building the Pacific Railroad, and a company for that purpose, of which he was elected president, was formed on July 1 of that year. He superintended the construction of that part of the road that crossed the mountains, spending personally more than \$20,000,000 on a stretch of roadway of 100 miles. He became interested in the construction of other railways and in the development of the agriculture and manufactures of California. He was elected to the U. S. Senate as a Republican for the term 1885-91. With his wife he founded LELAND STANFORD JUNIOR UNIVERSITY (q. v.). D. at Palo Alto, Cal., June 20, 1893.

**Stanhope, CHARLES MAHON, F. R. S.,** Third Earl Stanhope and Viscount Mahon: inventor; b. in London, England, Aug. 3, 1753; entered Parliament 1780; succeeded to the peerage 1786; was noted for his radical opinions; declared himself a republican, and laid aside the insignia of nobility; distinguished himself by his scientific researches; made many improvements in the art of printing, and in 1816 invented the Stanhope printing-press. D. in London, Dec. 15, 1816.

**Stanhope, EDWARD:** statesman; second son of the fifth Earl of Stanhope; b. in London, Sept. 24, 1840; educated at Harrow and Oxford; called to the bar 1865; entered Parliament 1874; Under-Secretary of State for India 1878-80; vice-president of the committee of council on education 1885; president of the Board of Trade 1885-86; Secretary of State for the Colonies under Lord Salisbury 1896; Secretary of State for War in his second administration 1887.

**Stanhope, Lady HESTER LUCY:** daughter of Charles, third Earl Stanhope; b. at Chevening, Kent, England, Mar. 12, 1776; was for ten years a member of the family of her

uncle, William Pitt, to whom she acted as confidential secretary until his death in 1806; received thereafter a pension of £1,200, upon which she resided some years in Wales; proceeded in 1810 to Syria; visited Jerusalem, Damascus, Baalbec, and Palmyra; acquired by her magnificent and singular ways of living the respect and veneration of the Arabs, who treated her almost as a queen; established herself in 1814 in the deserted convent of Mar Elias, 8 miles from Sidon, upon a crag of Lebanon; adopted the dress and style of an emir, having at her command a guard of Albanians, over whom she exercised an absolute authority; became a benefactress to political refugees and to the poor of every kind; exerted considerable political influence; and practiced astrology. D. at Mar Elias, June 23, 1839. Her *Memoirs* (3 vols., 1845) and *Seven Years' Travels* (3 vols., 1846) were published by her physician, Dr. Meryon.

**Stanhope, JAMES,** First Earl Stanhope: soldier; b. in Paris, France, in 1673; resided in Spain, where his father was minister during 1690-94; entered the army 1694; was wounded at the siege of Namur 1695; served in Flanders until the Peace of Ryswick; was elected to Parliament 1702; took part in the expeditions of 1702 and 1704 in Spain; was a brigadier-general at the siege of Barcelona 1705; major-general 1707; commander-in-chief in Spain, and took Port Mahon, Minorca, 1708; defeated the Spaniards at Almenara and Sagossa (Aug., 1710), but was forced to surrender to the Duke of Vendôme at Brihuega, Dec. 8, 1710; was appointed Secretary of State on the accession of George I., 1714; became First Lord of the Treasury and Chancellor of the Exchequer 1717; was created Viscount Stanhope of Mahon July 2, 1717, and Earl Stanhope Apr., 1718; was again Secretary of State, and took part in negotiating the Quadruple Alliance 1718. D. in London, Feb. 5, 1721.

**Stanhope, PHILIP DORMER:** See CHESTERFIELD.

**Stanhope, PHILIP HENRY,** Fifth Earl Stanhope, better known as Lord Mahon: statesman and author; b. at Walmer, Kent, England, Jan. 31, 1805; was a grandson of Charles, the third earl; graduated from Christ Church, Oxford, 1827; was elected to Parliament in 1830; was Under-Secretary of State for Foreign Affairs (the Duke of Wellington being the secretary) in the first Peel ministry 1834; was secretary to the board of control in the last year of the second Peel ministry 1845-46; supported the repeal of the corn-laws; introduced and carried the copyright act of 1842; was chosen president of the Society of Antiquaries 1846; was defeated at the parliamentary elections of 1852 in consequence of having voted with the protectionists against the modification of the navigation laws; succeeded to the earldom Mar. 2, 1855; founded the Stanhope prize for the study of modern history at Oxford 1855; was chosen lord rector of the University of Aberdeen 1858, and one of the six foreign members of the Academy of Moral and Political Sciences at Paris May 11, 1872. D. at Bournemouth, Hampshire, Dec. 24, 1875. Author of *History of the War of Succession in Spain* (1832); *History of England from the Peace of Utrecht to the Peace of Versailles, 1713-83* (7 vols. 8vo, 1836-58); *Essai sur la Vie du Grand Condé* (privately printed, 1842, and afterward appeared in English as *The Life of Louis, Prince of Condé*, 1845); *The Life of the Right Hon. William Pitt, with Extracts from his Unpublished Correspondence and MS. Papers* (4 vols., 1861-62; 4th ed. 1867); and a *History of England, comprising the Reign of Anne, until the Peace of Utrecht* (1870). Several fragments of his great work have been separately published, as *The Forty-Five, being a Narrative of the Rebellion in Scotland in 1745* (1851) and *The Rise of Our Indian Empire* (1858). Lord Stanhope edited, with notes, *The Letters of Philip Dormer Stanhope, Earl of Chesterfield* (4 vols., 1845); *The Memoirs of Sir Robert Peel* (2 vols., 1856-57).

**Stan'islas Augustus,** King of Poland: See PONIATOWSKI.

**Stanislas Leszczyński,** -lesh-tseń'ské: King of Poland; b. at Lemberg, Galicia, Oct. 20, 1677, of one of the oldest and wealthiest families of the Polish nobility; held a high position at the Polish court, and was palatine of Posen when the war broke out between Charles XII. of Sweden and Augustus II. of Poland and Saxony. By the diplomatic negotiations which he carried on between Augustus and Charles he won the favor, and even the friendship, of the latter, and when, after the complete defeat of Augustus, Charles declared the Polish throne vacant, Stanislas was by his influence elected King of Poland in 1705. He was a noble character, and not without talent as a ruler, but after

was created Baron Stanley of Preston in the peerage of Great Britain in 1896, and on the death of his brother in 1893 became sixteenth Earl of Derby. NEIL MACDONALD.

**Stanley, HENRY MORTON, D. C. L.:** African explorer; b. near Denbigh, Wales, in 1841, of humble parentage. He was placed in the poorhouse, where he remained until his thirteenth year, after which he taught in a school, and subsequently shipped as cabin-boy for New Orleans, where he was adopted by a merchant, whose name he assumed instead of his own, which was John Rowlands. His adoptive father having died without a will, and the civil war breaking out, he enlisted in the Confederate army; was taken prisoner; volunteered in the U. S. navy, and became acting ensign on an ironclad. After the close of the war he went as a newspaper correspondent to Turkey and Asia Minor, and in 1868 accompanied the British expedition to Abyssinia as correspondent of *The New York Herald*, a portion of his correspondence being subsequently embodied in a volume. In Oct., 1869, being then in Spain, he was employed by the *Herald* to head an expedition to learn the fate of Livingstone, the African explorer, from whom only vague intimations had been heard for two years. He reached Zanzibar in Jan., 1871, and toward the end of March set out for the interior, with a company of 192 men. In November he found Livingstone, who was living near Lake Tanganyika, and furnished him with supplies for further explorations. After having explored the northern portion of the lake, Stanley set out on his return journey in Mar., 1872, reaching England in July, where he was received with distinguished honor, the Queen sending him a gold snuff-box set with diamonds, and the Royal Geographical Society awarding to him in 1873 its patron's medal. Tidings having been received of the death of Livingstone in Central Africa, Stanley was placed at the head of an expedition, the cost of which was jointly undertaken by *The New York Herald* and the *London Daily Telegraph*, to explore the lake region of equatorial Africa. He left the coast in Nov., 1874, at the head of 800 men, and after many hardships and some severe contests with the natives reached Lake Victoria Nyanza Feb. 27, 1875, having in the meantime lost 194 men by death and desertion. He circumnavigated the lake in a boat brought with him in pieces, and found it to be a single large lake, and not, as supposed by Burton and Livingstone, a group of lagoons, thus confirming the opinions of Speke and Grant. He started Apr. 17, 1875, to continue his explorations in the direction of Lake Albert Edward Nyanza. He arrived at the mouth of the Congo river Aug. 12, 1877, having explored its whole course; returned to the Congo in 1879, at the head of a Belgian international expedition; lectured in the U. S., on Africa, in Dec., 1886; returned to Congo Free State in 1887 with an expedition for the relief of Emin Bey, whom he found on the Albert Nyanza Apr. 28, 1888. He returned with Emin toward the east coast in May, 1889, and reached the coast himself on Dec. 6 of the same year. On the return trip he discovered the Ruwenzori Mountains S. of Albert Nyanza. On his return to England in 1890 he received honorary degrees from the universities, and a special medal from the Royal Geographical Society. In the following year he visited the U. S. and Australia on lecturing tours, and returning to London in 1892 he unsuccessfully stood for North Lambeth as a Unionist candidate. His principal works are *How I found Livingstone* (London and New York, 1872); *Coomassie and Magdala* (1874); *Through the Dark Continent* (1878); *The Congo, and the Founding of its Free State* (2 vols., 1885); *In Darkest Africa* (1890); *My Dark Companions* (1893); and *Slavery and the Slave-trade in Africa* (1893).

Revised by M. W. HARRINGTON.

**Stanley, THOMAS:** classical scholar; b. at Comberlow, Hertfordshire, England, in 1625; was carefully educated at home; graduated at Cambridge 1641; studied law at the Middle Temple; published in 1647 a volume of *Poems and Translations* (from Anacreon, Bion, Moschus, etc.), frequently reprinted; issued his chief work, *The History of Philosophy, containing the Lives, Opinions, Actions, and Discourses of the Philosophers of every Sect*, in 4 vols., at intervals between 1655 and 1682 (2d ed. folio, 1687; best ed., with *Life of the author*, 4to, 1743), and in 1663-64 his elaborate edition of *The Tragedies of Æschylus*, with Latin translation, Greek scholia, and commentary, which long maintained its ground among English scholars (best ed. by Butler, 1809-16). D. in London, Apr. 12, 1678. See Brydges's edition of Stanley's *Poems with Life* (1814-15).

**Stannard, HENRIETTA ELIZA VAUGHAN (Palmer):** novelist; b. at York, England, Jan. 13, 1856; daughter of Rev. Henry Vaughan Palmer, rector of St. Margaret's, York; married, 1884, Arthur Stannard, a civil engineer. Her father had been an artillery officer before taking holy orders, and Mrs. Stannard's numerous fictions have dealt mainly with army life. Among these, published under the pseudonyms of John Strange Winter and Violet Whyte, are *Cavalry Life* (1881); *Regimental Legends* (1883); the very popular *Boodle's Baby* (1885); *Houp-la* (1885); *Army Society Life in a Garrison Town* (1886); *Garrison Gossip* (1887); and *A Siege Baby* (1887). H. A. BEERS.

**Stannaries** [from Lat. *stan'num*, tin]: in general, tin mines; in a special sense, those of Cornwall and Devon, concerning which there are peculiar laws and usages. The court of the stannaries is very ancient, exercising a jurisdiction in the time of Lord Coke which was "guided by special laws, by customs, and by prescription time out of mind." It was established in order that the workers in these mines might sue and be sued in their own court, "and not be drawn from their business to their own private loss and to the public detriment by attending their lawsuits in other courts." The early charters, records, and acts of Parliament relating to this subject are summarized in Coke's *Fourth Institute*, chap. xlv. The principal modern statutes bearing upon the stannaries are 6 and 7 Will. IV., c. 106, as amended by subsequent acts, which regulates the constitution and the procedure in these courts, and 33 and 33 Vict., c. 19, amended by 50 and 51 Vict., c. 23, relating to mining partnerships within their jurisdiction. The judges of the stannaries court are appointed by the Duke of Cornwall (the Prince of Wales), or, when there is none of full age, by the crown. See Bainbridge on *Mines*, ch. vi., §§ 8-5, and Batten's *Stannaries Act*. FRANCIS M. BURDICK.

**Stannic Acid:** a-hydrate, SnO(OH)<sub>2</sub>, obtained from stannous oxide. See TIN (*Compounds of Tin*).

**Stanovoi' Range** [Russ. *Stanovoi Khrebet*, i. e. back-bone]: name given by Pallas to the mountains at the source of the Olekma, but since expanded to embrace the whole Siberian watershed between the Arctic and Pacific drainage systems. It is very imperfectly known, but appears to extend N. E. from near Urga, in North Central Mongolia, to the Chukchu Peninsula, a distance of 2,700 miles. It consists of parallel ranges of mountains with elevated plateaus, which are often very marshy, is more rugged on its eastern than on the western slopes, and is through much of its extent clothed with forests and rich in minerals. A principal range on the western side is the Yablonnoi Khrebet, which borders the plateau of Vitim. The highest point is Mt. Sokhondo (lat. about 60° N., lon. 110° E.), about 9,250 feet. MARK W. HARRINGTON.

**Stanstead:** the *chef-lieu* of Stanstead County, Quebec, Canada, and the terminus of a branch of the Boston and Maine Railway line, which runs through the Masawippi valley (see map of Quebec, ref. 6-C). It is close to the boundary-line of the U. S., which separates it from North Derby or Derby Line, Vt. It includes Stanstead Plain and Rock Island; in the former there is a Wesleyan College and several churches; in the latter are several factories. It is on the edge of a rich farming and grazing country. Pop. 4,200. J. M. H.

**Stanton:** city; capital of Montcalm co., Mich.; on the Detroit, Lans., and N. Railroad; 15 miles N. E. of Greenville, 62 miles N. W. of Lansing (for location, see map of Michigan, ref. 6-I). It is in an agricultural region, and contains a public high school, flour-mills, planing-mills, foundry, machine-shops, a private bank, and two weekly newspapers. Pop. (1880) 1,760; (1890) 1,352.

**Stanton, EDWIN McMASTERS:** lawyer and Secretary of War; b. at Steubenville, O., Dec. 19, 1814; admitted to the bar in 1836; reporter of the Supreme Court of Ohio 1842-45, reporting vols. xi.-xiii. of *Ohio Reports*. In 1845 he successfully and with distinction defended in the criminal court at Washington Caleb J. McNulty, clerk of the House of Representatives, tried for embezzlement. He first acquired national reputation as a lawyer in the important case of *The State of Pennsylvania vs. The Wheeling Bridge Company*, involving the question whether control of bridges over navigable rivers of the West flowing between the several States is vested by the Constitution in Congress or the State Legislatures. It was decided that Pennsylvania's interest in the controversy gave her standing in that court, and that regulation of bridges over navigable rivers of the

What is termed the Congress, or centre of State control. Stanton's correspondence in the case by Stanton seems as marked by honest feeling, logic, and eloquence that of any and all contemporaries. In 1860 he removed to Washington to succeed to his position before the U. S. Supreme Court, and in 1862 went to California and remained nearly a year as attorney for the U. S. in certain land cases involving many millions of dollars. Besides carrying on a successful case these cases, which his environment especially related, his services were available in the collection, collation, and preparation of Mexican archives. The archives collected through his efforts furnished extensive evidence of an important system of land titles carried on for a long time in California. The value of lands claimed under forged grants was estimated at not less than \$150,000,000. A few years, however, these archives furnished the means of dispossessing valid from forged grants, and enabled a successful defense to be made in every fraudulent claim.

In 1861, when active preparations were being made for succession and the indications as to the political future of the Republic were appalling, Cass, Secretary of State, suddenly resigned, and Chief Attorney-General, succeeded him, choosing then in the most urgent case before the U. S. national court, was appointed Attorney-General. Acceptance of the office involved relinquishment of profitable professional business and assumption of great responsibility, with little prospect of personal distinction. He accepted the office, and in it he steadily was that of resolute maintenance of national honor and determined opposition to treason, until a handful of U. S. troops were assembled at Washington, and the residents of the capital were usually in sympathy with secession. To a greater extent probably than any of his associates in the cabinet, Stanton perceived the importance of an attempt to prevent Lincoln's inauguration, to seize and hold the capital and fragments of government for the seceding States, and thus to exhibit the latter to the world as a government *de facto*, exceeding to the power and authority of the U. S. On Mar. 4, 1861, Stanton retired with the outgoing administration and resumed his profession. After the civil war had existed several months, persistent secession and constant uprisings, without Stanton's knowledge, urged President Lincoln to place him in charge of the War Department. On Jan. 30, 1862, he became Secretary of War. Respecting a brief meeting in 1867 in the cabinet, in a moment in which they were both of cabinet, there had previously been no interference between Lincoln and Stanton; but after the latter entered the War Department their mutual friendship and confidence grew with each day. The characteristics of Stanton's administration were integrity, energy, determination, singleness of purpose, and capacity to comprehend the magnitude of the transaction and the labor and cost in blood and treasure involved in suppressing it.

After Lincoln's assassination and Johnson's accession to the presidency, Stanton was connected with the latter's administration for three years. He supported many measures which were vetoed by the President and re-enacted by Congress, including those for the establishment of the Freedmen's Bureau, for protection of civil rights, for admission of colored men to a State, for organization of governments in insurrectionary States, and for conferring suffrage without regard to color in the District of Columbia. These differences of opinion and the continued adherence of Stanton to the Republican party and the President's separation from and aggressive hostility toward it, led the President on Aug. 5, 1867, to notify Stanton that public considerations of a high character constrained him to request the latter's resignation; to which Stanton answered that public considerations of a high character, which alone had induced him to consent to the head of the department, constrained him not to resign before the next meeting of Congress. On Aug. 22 the President notified him of his suspension from office. After Congress convened, the Senate refused by a vote of 65 to 6 to concur in the suspension. Having received official information of the refusal of the Senate Stanton on the same day (Jan. 18, 1868) resumed his office. On Feb. 21, 1868, the President understood his removal from and to appoint William T. Sherman Secretary of War *ad interim*. The Senate, having on the same day officially informed by the President of this action, resolved that under the Constitution and laws the President had no power to remove the Secretary of War and appoint another officer to perform the duties of that office, and officially communicated the

resolution to Stanton. The House of Representatives immediately declined to impeach the President. In consequence of this action of both houses of Congress and the general apprehension of revolutionary progress on the part of the President, Stanton refused to relinquish control of his department. After the trial and acquittal of the President under articles of impeachment, Stanton relinquished his office. The Senate on May 24 again resolved that he had not been legally removed and based its conclusions on the testimony of Gen. Schellbach, upon Stanton's voluntary retirement. Sent forward both houses of Congress signed a vote of thanks to him for his great ability, purity, and fidelity.

With his health shattered by his labors in the War Department, he resumed his profession and arranged several important cases. The last was *Washington vs. Brown*, an important patent case, which, in consequence of Stanton's feeble health, was heard by Judge Sawyer in Stanton's seventy-first week before the latter's death. He never again left his chamber. On Dec. 20, 1869, he was succeeded by President Grant as an associate justice of the U. S. Supreme Court, and was immediately confirmed by the Senate; but on Dec. 24 he died without having entered upon the duties of his new office.

**Stanton, Elizabeth (Gladys) reformer; b. at Johnstown, N. Y., Nov. 12, 1815; daughter of Judge David Gady; educated at the Johnstown Academy, where she studied with a class of boys; was fitted for college at the age of fifteen and pursued her studies at Mrs. Willard's Seminary at Troy; had her attention turned to the abolition of slavery by her own educational experience and a study of Hooker, Scott, and Kent; married, in 1840, Horatio B. Stanton, reformer, author, and State Senator; d. 1887; accompanied him to the World's Anti-Slavery convention at London; there made the acquaintance of Lucretia Mott; resided in Boston until 1847, when they settled at Seneca Falls, N. Y.; with Lucretia Mott signed the call for the first woman's rights convention, which met at her place of residence July 19-20, 1848, on which occasion the first formal claim of suffrage for women was made; drafted provisions for the married woman's property bill, and had a hearing before a legislative committee 1844; addressed the New York Legislature in 1845 on the right of suffrage, in 1860 in advocacy of divorce for drunkenness, and in 1867 both the Legislature and the constitutional convention, maintaining that during the revision of the constitution the State was resolved into its original elements, and that all the citizens had therefore a right to vote for members of that convention. Since 1860 she has frequently addressed congressional committees and State constitutional conventions. She addressed Kansas in 1867, and Michigan in 1874, when the question of woman suffrage was submitted in those States; was one of the editors of *The Revolution*. Most of the resolutions and resolutions for conventions, addresses to women, legislatures, and Congress, have been from her pen. She was president of the national woman's rights committee 1860-61, of the Woman's League 1869, and of the National Association until she withdrew in 1882; spent several years in France and England, and spoke many times in the great conventions in England and Scotland, and at parlor meetings in London; contributed articles to *The Westminster Review* and to journals and magazines in the U. S. She was president of the first International Council of Women held in Washington in 1883. With Miss Susan B. Anthony and Mrs. Mott led Gage, she is the author of *The History of Woman Suffrage in Ohio*, New York, 1861-66.**

See also R. A. Anaya.

**Stanton, Theodore, M. A.** a journalist; son of Mrs. Elizabeth Gady Stanton; b. at Seneca Falls, N. Y., Feb. 19, 1841; educated at the College of the City of New York and at Cornell University; was Berlin correspondent of *The New York Tribune* 1869; settled in Paris to engage in journalism; member International Jury Paris Exposition, 1889; resident correspondent in France, *Washington Exposition*, 1889; a member of the Legion of Honor; translator and editor of *Le Goff's Life of Thomas* (New York, 1870); author of *The Woman Question in Europe* (1884) and of contributions to periodicals.

**Stanton, John**, soldier; b. in England about 1680; entered the British army 1701; served as an officer of grenadiers and marines; became lieutenant-colonel of the 2nd army to Frederick, Prince of Wales 1746; was governor of Canada and its representative in Parliament 1759; became on party quartermaster general of the forces 1754; was twice released commanding the first battalion of the Sixtieth Regi-

ment (Royal Americans) Jan. 1, 1756; was in command of the southern district of the American colonies, with headquarters at Carlisle, Pa., 1757; was appointed brigadier-general Dec. 27, 1757; was relieved by Gen. Forbes early in 1758, and intrusted (1758) with the erection of the important fortress known as Fort Stanwix at the "Oneida carrying-place" (now Rome) on Mohawk river, at an expense of £60,000, as a defense against incursions from the French in Canada; returned to Pennsylvania; was appointed major-general June 19, 1759; repaired and fortified the old fort Du Quesne at Pittsburg, securing the good will of the Ohio Indians; resigned his commission in America to Gen. Monckton May 4, 1760, and returned to England; was appointed lieutenant-general Jan. 19, 1761; was made lieutenant-governor of the Isle of Wight and colonel of the Eighth Foot, and was elected member of Parliament for Appleby. He was lost at sea in Dec., 1765, while crossing the Irish Channel from Dublin to Holyhead in a packet.

**Stan'yhurst, RICHARD:** historian and theologian; b. in Dublin about 1545; educated at University College, Oxford; studied law; returned to Ireland; married, became a Roman Catholic, and went to the Continent. On the death of his wife he became a priest, and was appointed chaplain to Archduke Albert, governor of the Spanish Netherlands. D. at Brussels in 1618. He translated into English heroic verse *The First Four Books of Virgil's Æneis* (1583); furnished a *Description of Ireland* to Holinshed's *Chronicles*; wrote historical treatises (in Latin) on Ireland, and English and Latin theological works.

**Staphyllin'idæ:** the ROVE-BEETLES (q. v.).
